High speed VSCF generator design consideration --- computer aided design for Variable Speed Constant Frequency generator A82-24379
Advanced generating system technology A82-24380
ACCELERATED LIFE TESTS
Aircraft electric system development and test facilities A82-24384
Advanced attack helicopter fatigue testing - Overview A82-24720
ACCELERATION (PHYSICS)
Aircrew restraint and mobility test fixture
[AD-A108274] N82-18193
ACCEPTABILITY
Physiological acceptability tests of the SJU-5/A ejection seat: Second physiological acceptance demonstration
[AD-A108686] N82-18194
ACCIDENT PREVENTION
Scanning strategies for air traffic control radars A82-24646
The toll of ILS-preventable aviation accidents A82-25325
ACOUSTIC DUCTS
Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
[ASME PAPER 81-WA/NCA-13] A82-24602
ACOUSTIC EMISSION
NDE of composite rotor blades during fatigue testing A82-24713
ACOUSTIC FATIGUE
On the sonic fatigue life estimation of skin structures at room and elevated temperatures A82-23678
ACOUSTIC IMPEDANCE
Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
[ASME PAPER 81-WA/NCA-13] A82-24602
ACOUSTIC PROPAGATION
Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
[ASME PAPER 81-WA/NCA-13] A82-24602
ACOUSTIC PROPERTIES
Effect of facility variation on the acoustic characteristics of three single stream nozzles
[NASA-TM-81635] N82-19946
ACOUSTIC RETROFITTING
Airport related residential acoustical insulation demonstration project: Report 1720
[PB82-100777] N82-19396
ACRYLIC RESINS
Acrylic - A timely review A82-24317
Lucas stretched acrylic A82-24318
Problems associated with the quality assurance of stretched acrylic sheet A82-24319
The effects of absorbed moisture upon the physical properties of stretched acrylic materials A82-24320
ACTIVE CONTROL
Fighters - Tomorrow's terminology A82-23360
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts
[MBB-FE-172/S/PUB/39-PT-1] N82-19220
ACTUATORS
The influence of sensor and actuator characteristics on overall helicopter AFCS design N82-18171
Slotted variable camber flap
[NASA-CASE-LAR-12541-1] N82-18203
Overview of Honeywell electromechanical actuation programs N82-19142
Electric flight systems N82-19144
Electromechanical actuators N82-19148
Electric flight systems integration N82-19150
ADAPTIVE CONTROL
Mission-adaptive wing flight demonstration program
[SAE PAPER 811035] A82-24399
Apparatus for damping operator induced oscillations of a controlled system --- flight control
[NASA-CASE-FRC-11041-1] N82-18493
ADAPTIVE FILTERS
Apparatus for damping operator induced oscillations of a controlled system --- flight control
[NASA-CASE-FRC-11041-1] N82-18493
AEROACOUSTICS
Acoustic fatigue endurance test of FSB flap structure models at elevated temperature
[NAL-TR-683] N82-19570

DATA PROCESSING
Distributed data processing modeling for future ATC systems
A82-23319
DATA PROCESSING EQUIPMENT
Air traffic control en route computer system
[GPO-89-008] N82-19202
DATA RECORDING
A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors
[RAE-TM-RAD-NAV-145] N82-18503
DATA REDUCTION
Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data
A82-25113
Improvements and extensions of the Geometrical Dilution of Precision (GDOP) concept for selecting navigation measurements
[AD-A108607] N82-18197
Test site instrumentation study. Volume 2: Crash 1 and crash 2 raw data
[PB82-111832] N82-18233
DC 9 AIRCRAFT
D.C.9 windshield - Effect of attachment retorque
A82-24324
DC 10 AIRCRAFT
Deficiencies and constraints that affect the design of cockpit enclosures and transparencies
A82-24303
DEAD RECKONING
On the calculation of separated flow on helicopter fuselages
[MBB-UD-321-81-O] N82-18188
DEFECTS
A compilation of stress intensity factor solutions for flawed fastener holes
[AD-A108753] N82-18628
DEFENSE PROGRAM
Review of defense-related vertical and short takeoff and landing (V/STOL) aircraft programs
[GPO-55-278] N82-18205
DEICING
Transparencies - What an aircraft designer should know
A82-24305
DEMAND (ECONOMICS)
Selection of telecommunication equipment - A new approach to the equivalent cost concept
A82-25510
DESCENT
Descent-rate cuing for carrier landings: Effects of display gain, display noise and aircraft type
[AD-A108801] N82-19206
DESIGN ANALYSIS
YF-16 design concept and philosophy
A82-23444
Aircraft transparency design guide
A82-24307
Design considerations of DC-Link aircraft generation systems
A82-24377
Design technology for improved performance retention in turbofan engines
[SAE PAPER 811055] A82-24392
Airworthiness considerations in the design of commercial transport aircraft
[SAE PAPER 811039] A82-24396
Designing for continued airworthiness - General aviation
[SAE PAPER 811038] A82-24397
Aircraft/airport compatibility - A constant challenge for aircraft designers
A82-25119
Design philosophy of the Hughes model 600 helicopter
N82-18140
A design study of the Marshal --- lightweight twin-engined aircraft
[BU-262] N82-19215
Cooled variable-area radial turbine technology program
[NASA-CR-165408] N82-19221
DESIGN TO COST
Task analytic techniques: Application to the design of a flight simulator instructor/operator console
[AD-A108724] N82-18227
DETERIORATION
MSG-3 structures --- inspection program for aircraft maintenance
A82-24011
RB 211 powerplant deterioration - Review of current situation and lessons learned
[SAE PAPER 811053] A82-24393
DIFFUSION WELDING
Diffusion bonding in superplastic forming/diffusion bonding
A82-23754
Metal honeycomb to porous wireform substrate diffusion bond evaluation
[NASA-TM-82793] N82-18612
Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures
[NASA-CR-165827] N82-19358
DIGITAL SYSTEMS
Digital flight controls
N82-19143
Digital flight controls
N82-19149
DIGITAL TECHNIQUES
Computer-generated images for simulators - The cost of technology
A82-22881
MIL-STD 1553B - Aircraft EM environmental susceptibility effects
A82-24357
Efficient combinations of numerical techniques applied to aircraft turning performance optimization
A82-24814
DILUTION
Dilution jet behavior in the turn section of a reverse flow combustor
[NASA-TM-82776] N82-19220
DIPOLE ANTENNAS
Analysis of the crossed dipole antenna as a model for aircraft in an electromagnetic environment
A82-25002
DIRECT CURRENT
Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States
A82-24382
DIRECTIONAL STABILITY
Interpretation and construction of a dynamic similarity model of the A 310 wings
[MBB-FE-17/S/PUB/42] N82-18212
DISASTERS
Importance of a tactical cargo aircraft in emergency relief
A82-25499
DISCRETE ADDRESS BEACON SYSTEM
Discrete Address Beacon System /DABS/
A82-23322
DISPLAY DEVICES
The use of dynamic mock-ups in the design of advanced systems --- USAF's Digital Avionic Information System and NAVY's Advanced Integrated Display System
A82-22902
Combined multisensor displays --- image preprocessing for shape coding to reduce pilot workload
A82-22905
Loran for precise position location - The VIEW-NAV system
A82-24648
Advanced electronic displays and their potential in future transport aircraft
A82-25216
Electronic flight instrument systems /EFIS/, the instrumentation of the 1980s
A82-25324
The multi mode matrix flat panel display: Technology and applications
N82-18169
Analytical study of cockpit information requirements
[AD-A108524] N82-18218
Descent-rate cuing for carrier landings: Effects of display gain, display noise and aircraft type
[AD-A108801] N82-19206
Transport aircraft cockpit standardization (Federal Aviation regulations part 25)
[AD-A108924] N82-19207

DISTANCE MEASURING EQUIPMENT
The birth of precision DME
A82-24066
Loran-C RNAV in mountainous areas
A82-24649
DISTRIBUTED PARAMETER SYSTEMS
Distributed intelligence for air fleet control
[AD-A108611] N82-18195
DOWNWASH
Angle of downwash behind a wing in unsteady flow
A82-24970
Helicopter rotor downwash: Results of experimental research at the DFVLR-rotor test stand and their comparison with theoretical results
N82-18158
DRAG REDUCTION
Fuel-efficient windshields for transport, commuter and business aircraft
A82-24304
Aircraft surface coatings for drag reduction/erosion protection
[SAE PAPER 811070] A82-24401
Developments in rotary wing aircraft aerodynamics
N82-18120
Laminar airfoils for transport aircraft
[ESA-TT-680] N82-18190
On the design of some airfoils for sailplane application --- additions to existing wings for inflight testing
[VTH-LR-326] N82-19213
DRONE AIRCRAFT
A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors
[RAE-TM-RAD-NAV-145] N82-18503
DUCT GEOMETRY
Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
[ASME PAPER 81-WA/NCA-13] A82-24602
DUCTED FANS
An experimental study of the effects of an inlet flow conditioner on the noise of a low speed axial flow fan --- in an aircraft engine
[TT-8101] N82-19956
DUCTED FLOW
An ejector augmented choking valve for the metering and control of inlet and bleed duct flows
[AIAA 82-0575] A82-24659
DUPLEX OPERATION
An on board supervisory system for applications in space missions
[INPE-2097-RPE/327] N82-18216
DYNAMIC CHARACTERISTICS
A method for the investigation of gyrostabilization systems
A82-24892
A study of the techniques of dynamic analysis of helicopter type structures
N82-18129
DYNAMIC RESPONSE
Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility
[NASA-TP-1959] N82-18204
A criterion for the prediction of the recovery characteristics of spinning aircraft
[RAE-TM-AERO-2251] N82-19223
Acoustic fatigue endurance test of USB flap structure models at elevated temperature
[NAL-TR-683] N82-19570
DYNAMIC STABILITY
Stability of a three-stage dynamic stand
A82-25353
DYNAMIC STRUCTURAL ANALYSIS
Aircraft transparency bird impact analysis using the MAGNA computer program
A82-24315
High speed VSCF generator design consideration --- computer aided design for Variable Speed Constant Frequency generator
A82-24379
DYNAMIC TESTS
Review of support interference in dynamic tests
[AIAA 82-0594] A82-24660

E

ECONOMETRICS
Selection of telecommunication equipment - A new approach to the equivalent cost concept
A82-25510
EJECTION INJURIES
Physiological acceptability tests of the SJU-5/A ejection seat: Second physiological acceptance demonstration
[AD-A108688] N82-18194
EJECTION SEATS
Multiple ejection effects analysis
[AD-A108277] N82-18192
Physiological acceptability tests of the SJU-5/A ejection seat: Second physiological acceptance demonstration
[AD-A108688] N82-18194
EJECTORS
The effect of ejector augmentation on test-section flow quality in the Calspan 8-ft transonic wind tunnel
[AIAA 82-0571] A82-24658
ELECTRIC AUTOMOBILES
Vehicle test report: Battronic pickup truck
[NASA-CR-168637] N82-19205
ELECTRIC CONTROL
On-line control for the regulation of power source in multiple-servo electro-hydraulic systems
[ASME PAPER 81-WA/DSC-3] A82-24562
ELECTRIC FIELD STRENGTH
Calculation and measurement of electric field strength for airborne antennas in the LF/HF range
A82-25011
ELECTRIC FIELDS
TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km
[AD-A108182] N82-18464
ELECTRIC GENERATORS
Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981
[SAE SP-500] A82-24376
Cost of ownership advantages with a shared oil system
A82-24378
The effect of critical design parameters on the selection of a VSCF system
A82-24381
Packaging the VSCF system for an aircraft engine environment
A82-24383
Aircraft electric system development and test facilities
A82-24384
Electric Flight Systems
[NASA-CP-2209] N82-19134
A propulsion view of the all-electric airplane
N82-19136
Potential propulsion considerations and study areas for all-electric aircraft
N82-19137
A look into the future: The potential of the all-electric secondary power system for the energy efficient transport
N82-19138
The 400-Hertz constant-speed electrical generation systems
N82-19139
ELECTRIC MOTORS
Electric Flight Systems
[NASA-CP-2209] N82-19134
Electric flight systems, overview
N82-19135
A propulsion view of the all-electric airplane
N82-19136
Potential propulsion considerations and study areas for all-electric aircraft
N82-19137
A look into the future: The potential of the all-electric secondary power system for the energy efficient transport
N82-19138
Electric ECS
N82-19140
Environmental Control Systems
N82-19141

AERODYNAMIC BALANCE
A general purpose program for rotor blade dynamics N82-18151

AERODYNAMIC CHARACTERISTICS
Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers A82-24651
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test [AIAA 82-0568] A82-24656
The use of a multi-degree-of-freedom dual balance system to measure cross and cross-coupling derivatives [AIAA 82-0595] A82-24669
Status and capabilities of the National Full Scale Facility 40- by 80-foot wind tunnel modification [AIAA 82-0607] A82-24676
Angle of downwash behind a wing in unsteady flow A82-24970
Design philosophy of the Hughes model 600 helicopter N82-18140
Multiple ejection effects analysis [AD-A108277] N82-18192
Theoretical investigations on the influence of different strake, tail unit, and conventional HLW arrangement as well as of CCV on the aerodynamic characteristics of fighter aircraft configurations [MBB-FE-122/S/PUB/36] N82-18211
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 3: Aerodynamics and Structures Session [NASA-TM-84147] N82-19172
Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane [NASA-TM-83250] N82-19181
An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft --- static wind tunnel force measurements [NASA-CR-168578] N82-19224

AERODYNAMIC COEFFICIENTS
Theoretical investigations on the influence of different strake, tail unit, and conventional HLW arrangement as well as of CCV on the aerodynamic characteristics of fighter aircraft configurations [MBB-FE-122/S/PUB/36] N82-18211
A criterion for the prediction of the recovery characteristics of spinning aircraft [RAE-TM-AERO-2251] N82-19223

AERODYNAMIC CONFIGURATIONS
Parametric criteria and impact on design trends N82-18139
The effect of a well on the aerodynamics of a spoiler --- wind tunnel flow visualization and pressure measurement [BU-268] N82-19194

AERODYNAMIC INTERFERENCE
Transonic wind tunnel wall interference corrections for three-dimensional models [AIAA 82-0588] A82-24663
Optimum performance and wake geometry of co-axial rotor in hover N82-18156
A numerical approach to co-axial rotor aerodynamics N82-18157
Helicopter rotor downwash: Results of experimental research at the DFVLR-rotor test stand and their comparison with theoretical results N82-18158
Investigations of the separation behavior on airfoils at high angles of attack, using linear lift theory [MBB-FE-122/S/PUB/37] N82-18189
The effect of a well on the aerodynamics of a spoiler --- wind tunnel flow visualization and pressure measurement [BU-268] N82-19194

AERODYNAMIC LOADS
RB 211 powerplant deterioration - Review of current situation and lessons learned [SAE PAPER 811053] A82-24393
Operating flight loads and their effect on engine performance [SAE PAPER 811071] A82-24405
Hypothetical fatigue life problem - Application of Aerospatiale method A82-24716
Helicopter rotor load prediction A82-24719
Developments in rotary wing aircraft aerodynamics N82-18120
Some unsteady aerodynamic effects on helicopter rotors N82-18162
A method of predicting fuselage loads in hover N82-18164
Mast mounted visual aids N82-18167

AERODYNAMIC NOISE
Wind tunnel investigation of high speed rotor noise N82-18146
Prediction of blade vortex interaction noise from measured blade pressure N82-18147

AERODYNAMIC STABILITY
Oscillating supersonic/hypersonic wings at high incidence A82-23828
Review of support interference in dynamic tests [AIAA 82-0594] A82-24668
Cross and cross-coupling derivative measurements on the standard dynamics model at AEDC [AIAA 82-0596] A82-24670
A control model for maneuvering flight for application to a computer-flight testing program N82-18153
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts [MBB-FE-172/S/PUB/39-PT-1] N82-19228

AERODYNAMIC STALLING
Application of the ONER dynamic stall model to a helicopter blade in forward flight N82-18161
Some unsteady aerodynamic effects on helicopter rotors N82-18162

AERODYNAMICS
International Conference on Numerical Methods in Fluid Dynamics, 7th, Stanford University, Stanford and Moffett Field, CA, June 23-27, 1980, Proceedings A82-24426
XFV-12A diagnostic and development programs [AD-A108354] N82-18206
Tendencies in the development of subsonic transport aircraft with special consideration of aerodynamics [ESA-TT-705] N82-18214

AEROELASTICITY
Fighters - Tomorrow's terminology A82-23368
Application of the ONER dynamic stall model to a helicopter blade in forward flight N82-18161
Flutter and time response analyses of three degree of freedom airfoils in transonic flow [AD-A108987] N82-19227

AERONAUTICAL ENGINEERING
NASA pocket statistics [NASA-TM-84134] N82-19084
Aeronautical Research Laboratories Structures Division [AD-A109049] N82-19161

AEROSPACE ENGINEERING
Deficiencies and constraints that affect the design of cockpit enclosures and transparencies A82-24303

AEROSPACE INDUSTRY
Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980 A82-23751
What the operator wants --- airline cooperation in aircraft maintenance A82-24008
The use of 'Kapton' polyimide film in aerospace applications [SAE PAPER 811091] A82-24413

AEROTHERMODYNAMICS
Technical innovations in testing and analysis of heat and pressure models in hypersonic wind tunnels
[AIAA 82-0578] A82-24660
AH-64 HELICOPTER
Advanced attack helicopter fatigue testing - Overview A82-24720
AIR COOLING
Air cooled engine test facilities A82-24004
AIR DEFENSE
Army Lynx: Product development matched to military combat development N82-18143
A light helicopter for night firing N82-18144
Tethered rotorplatforms and their mission potential N82-18145
AIR FLOW
The effect of ejector augmentation on test-section flow quality in the Calspan 8-ft transonic wind tunnel
[AIAA 82-0571] A82-24658
AIR LAW
Air transportation of handicapped persons A82-24338
AIR NAVIGATION
Navigational aids on-board the Concorde A82-24065
Institute of Navigation, Annual Meeting, 37th, U.S. Naval Academy, Annapolis, MD, June 9-11, 1981, Proceedings A82-24643
The application of NAVSTAR differential GPS in the civilian community A82-24645
Beyond the horizon coverage for air navigation/traffic control A82-24647
Loran for precise position location - The VIEW-NAV system A82-24648
Analysis of loran-C system reliability for civil aviation A82-24650
Integration of inertial sensors in helicopters N82-18173
FAA/FCC coordination procedures for FM broadcast stations N82-19423
AIR TRAFFIC
Report of the Air Traffic Forecasting Working Party, 1981 N82-19195
FAA statistical handbook of aviation
[AD-A109289] N82-19198
AIR TRAFFIC CONTROL
Utilization of radio equipment at airports and on airways --- Russian book A82-22407
Stereographic projection in the National Airspace System A82-23031
Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings A82-23309
The requirements for reduced IFR separations on final approach A82-23311
Analysis of system problems using aviation safety reporting system data A82-23312
Reducing reflections on the front surface of air traffic control displays A82-23314
Utilizing the helicopter's versatility to improve the ATC system A82-23316
International plans for civil and military co-ordination A82-23317
Operational air traffic in the Federal Republic of Germany A82-23318
Distributed data processing modeling for future ATC systems A82-23319
Lightweight ATC systems A82-23321
Discrete Address Beacon System /DABS/ A82-23322
A Microwave Landing System simulation A82-23323
Voice communications - The vital link A82-23324
Institute of Navigation, Annual Meeting, 37th, U.S. Naval Academy, Annapolis, MD, June 9-11, 1981, Proceedings A82-24643
Scanning strategies for air traffic control radars A82-24646
Beyond the horizon coverage for air navigation/traffic control A82-24647
Conflicts between random flights in a given area A82-25213
Distributed intelligence for air fleet control
[AD-A108611] N82-18195
Analytical study of cockpit information requirements
[AD-A108524] N82-18218
National Airspace Data Interchange Network (NADIN) support of Remote Maintenance Monitoring System (RMMS)
[AD-A109125] N82-19160
FAA statistical handbook of aviation
[AD-A109289] N82-19198
Air traffic control en route computer system
[GPO-89-008] N82-19202
AIR TRANSPORTATION
Air Traffic Control computer replacement - Specification issues and problems A82-23313
Air transport in the 21st century A82-24025
Air transportation of handicapped persons A82-24338
Report of the Air Traffic Forecasting Working Party, 1981 N82-19195
AIRBORNE EQUIPMENT
LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System
[SAE PAPER 811080] A82-24412
Integration of complex systems in current and future aircraft projects for the example of avionics
[MBB-UH-18-80-O] N82-18221
FM broadcast interference related to airborne ILS, VOR and VHF communications
[RTCA/DO-176] N82-19419
AIRBORNE/SPACEBORNE COMPUTERS
The use of dynamic mock-ups in the design of advanced systems --- USAF's Digital Avionic Information System and NAVY's Advanced Integrated Display System A82-22902
High temperature engine control electronics
[SAE PAPER 811074] A82-24407
Loran for precise position location - The VIEW-NAV system A82-24648
Analysis of loran-C system reliability for civil aviation A82-24650
Flight condition recognition /FCR/ technique --- microprocessor-based recording for helicopter structural component fatigue damage A82-24712
A-7E software module guide
[AD-A108649] N82-18920
AIRCRAFT
Flight characteristics design and development of the MBB/KHI BK117 helicopter N82-18150
AIRCRAFT ACCIDENTS
Operational air traffic in the Federal Republic of Germany A82-23318
The toll of ILS-preventable aviation accidents A82-25325

Overview of Honeywell electromechanical actuation programs N82-19142
Digital flight controls N82-19143
Electric flight systems N82-19144
Engine technology N82-19145
Power systems N82-19146
Electromechanical actuators N82-19148
Digital flight controls N82-19149

ELECTRIC POWER SUPPLIES
  Recent improvements in aircraft Ni-Cd cells A82-24245
  Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981 [SAE SP-500] A82-24376
  Design considerations of DC-Link aircraft generation systems A82-24377
  The effect of critical design parameters on the selection of a VSCF system A82-24381
  Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States A82-24382
  Aircraft electric system development and test facilities A82-24384

ELECTRIC WIRE
  The use of 'Kapton' polyimide film in aerospace applications [SAE PAPER 811091] A82-24413

ELECTRICAL INSULATION
  The use of 'Kapton' polyimide film in aerospace applications [SAE PAPER 811091] A82-24413
  Electrical ground testing of aircraft antistatic protection N82-19156

ELECTRICAL RESISTIVITY
  A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum A82-23772
  Electrical ground testing of aircraft antistatic protection N82-19156

ELECTRO-OPTICS
  A new angular deviation measurement device for aircraft transparencies A82-24308

ELECTRODEPOSITION
  Electroforming of space and aircraft structures [MBB-BB-491-0] N82-18419

ELECTROFORMING
  Electroforming of space and aircraft structures [MBB-BB-491-0] N82-18419

ELECTROMAGNETIC COMPATIBILITY
  Materials aspects of aircraft EMC design A82-24358
  EMC clearance of modern military aircraft A82-24359
  The testing of aircraft under near field conditions A82-24361

ELECTROMAGNETIC INTERFERENCE
  The coupling of electromagnetic interference into aircraft systems A82-24354
  The variation of induced currents in aircraft wiring A82-24355
  MIL-STD 1553B - Aircraft EM environmental susceptibility effects A82-24357

ELECTROMAGNETIC MEASUREMENT
  The testing of aircraft under near field conditions A82-24361
  Calculation and measurement of electric field strength for airborne antennas in the LF/MF range A82-25011

ELECTROMAGNETIC NOISE MEASUREMENT
  Aircraft electric system development and test facilities A82-24384

ELECTROMAGNETIC WAVE TRANSMISSION
  Analysis of the crossed dipole antenna as a model for aircraft in an electromagnetic environment A82-25002
  A possible way of specifically correcting location and navigational errors caused by reflection and other propagation anomalies [ESA-TT-667] N82-18198

ELECTROMECHANICAL DEVICES
  Overview of Honeywell electromechanical actuation programs N82-19142
  Electric flight systems N82-19144
  Electromechanical actuators N82-19148

ELECTRON BEAM WELDING
  Novel approaches to electron beam welding machine utilization A82-23753

ELECTRONIC CONTROL
  Advanced generating system technology A82-24380
  The effect of critical design parameters on the selection of a VSCF system A82-24381
  Packaging the VSCF system for an aircraft engine environment A82-24383
  High temperature engine control electronics [SAE PAPER 811074] A82-24407

ELECTRONIC COUNTERMEASURES
  AN/ALQ-135 tail warning system follow-on operational test and evaluation [AD-A108348] N82-18471

ELECTRONIC EQUIPMENT
  Analysis of Built-In-Test (BIT) false alarm conditions [AD-A108752] N82-18217

ELECTRONIC EQUIPMENT TESTS
  The variation of induced currents in aircraft wiring A82-24355
  EMC clearance of modern military aircraft A82-24359
  The testing of aircraft under near field conditions A82-24361
  Aircraft electric system development and test facilities A82-24384
  AN/ALQ-135 tail warning system follow-on operational test and evaluation [AD-A108348] N82-18471
  Investigation of airborne VHF communication and navigation equipment N82-19421

ELECTROSTATIC CHARGE
  Electrical ground testing of aircraft antistatic protection N82-19156

EMERGENCIES
  Importance of a tactical cargo aircraft in emergency relief A82-25499

EMITTERS
  Antenna (selected articles) [AD-A108174] N82-19448

ENERGY CONSERVATION
  Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning A82-23470
  Wind and temperature database for flight planning [SAE PAPER 811068] A82-24385
  Integration of energy management concepts into the flight deck [SAE PAPER 811066] A82-24387
  Management of powerplant maintenance and restoration programs for fuel conservation [SAE PAPER 811052] A82-24394
  Airline fuel saving through JT9D engine refurbishment [SAE PAPER 811051] A82-24395

ENERGY CONSUMPTION
  Air transport in the 21st century A82-24025

ENERGY CONVERSION
Open-cycle vapor compression heat pump
[PB82-110503] N82-18553
ENGINE AIRFRAME INTEGRATION
The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators
[AIAA PAPER 82-2635] A82-25154
ENGINE CONTROL
High temperature engine control electronics
[SAE PAPER 811074] A82-24407
Reliability analysis of a dual-redundant engine controller
[SAE PAPER 811077] A82-24410
AFWAL turbine engine controls research and development - Present and future
[AIAA PAPER 82-0321] A82-25050
A redundancy concept for a digital CSAS
N82-18170
ENGINE DESIGN
Lineup of the IM-series aircraft-derivative gas turbines
A82-22896
Low grade fuels for turbo and jet engines
A82-23439
Reliable power --- Rolls-Royce aircraft engine designs
A82-24007
RB 211 powerplant deterioration - Review of current situation and lessons learned
[SAE PAPER 811053] A82-24393
Management of powerplant maintenance and restoration programs for fuel conservation
[SAE PAPER 811052] A82-24394
Airline fuel saving through JT9D engine refurbishment
[SAE PAPER 811051] A82-24395
Performance retention features of the PW2037
[SAE PAPER 811054] A82-24409
Prediction of off-design performance of turbo-shaft engines a simplified method
N82-18132
Component design and development for future helicopter engines
N82-18134
Three-engine control system for the prototype EH-101 helicopter
[AERG-9/81-1568L] N82-18135
Cooled variable-area radial turbine technology program
[NASA-CR-165408] N82-19221
ENGINE FAILURE
Monitoring engine wear by oil analysis
A82-24012
A digital simulation program describing the motion of an aircraft undergoing engine failure during its takeoff ground roll
[AD-A108420] N82-18210
ENGINE INLETS
Effects of fan inlet temperature disturbances on the stability of a turbofan engine
[NASA-TM-82699] N82-18222
ENGINE MONITORING INSTRUMENTS
Monitoring engine wear by oil analysis
A82-24012
Propulsion multiplexer /PMUX/ system - The missing link
[SAE PAPER 811078] A82-24411
ENGINE NOISE
Preliminary thoughts on helicopter cabin noise prediction methods
N82-18148
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945
ENGINE TESTS
Air cooled engine test facilities
A82-24004
Measurement techniques used to assess the installed power of a helicopter engine
N82-18133
ENVIRONMENT SIMULATION
Helicopter Icing Spray System (HISS) nozzle improvement evaluation
[AD-A109405] N82-19203
ENVIRONMENTAL CONTROL
Electric Flight Systems
[NASA-CP-2209] N82-19134
Electric ECS
N82-19140
Environmental Control Systems
N82-19141
Electric flight systems integration
N82-19150
ENVIRONMENTAL TESTS
The coupling of electromagnetic interference into aircraft systems
A82-24354
The variation of induced currents in aircraft wiring
A82-24355
EMC clearance of modern military aircraft
A82-24359
EPOXY MATRIX COMPOSITES
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding
[AD-A109377] N82-19209
ERROR ANALYSIS
Analysis of system problems using aviation safety reporting system data
A82-23312
EUROPEAN AIRBUS
A310 - Design for maintenance
A82-24002
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts
[MBB-FE-172/S/PUB/39-PT-1] N82-19228
EVOLUTION (DEVELOPMENT)
Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States
A82-24302
EXHAUST GASES
Fuel-rich plume combustion
[AD-A108136] N82-18309
EXHAUST NOZZLES
Prediction of off-design performance of turbo-shaft engines a simplified method
N82-18132
Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane
[NASA-TM-83250] N82-19181
EXHAUST SYSTEMS
Measurement techniques used to assess the installed power of a helicopter engine
N82-18133
Engine superficial temperature and infrared signature
N82-18136
EXPOSURE
A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials
[NASA-CR-165763] N82-18327
EXTERNALLY BLOWN FLAPS
Acoustic fatigue endurance test of USB flap structure models at elevated temperature
[NAL-TR-683] N82-19570

F

F-14 AIRCRAFT
Welding for low-cost advanced titanium airframe structures
A82-23757
Investigation of crossdeck pendant catapult slot interaction; proposed corrective measures
[AD-A108149] N82-18232
Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane
[NASA-TM-83250] N82-19181
F-16 AIRCRAFT
YF-16 design concept and philosophy
A82-23404
A new angular deviation measurement device for aircraft transparencies
A82-24306
F-18 AIRCRAFT
F/A-18 weapon system development
A82-23778

An assessment of the crash fire hazard of liquid hydrogen fueled aircraft [NASA-CR-165526] N82-19196
Aircraft collision avoidance systems [GPO-79-431] N82-19201

AIRCRAFT ANTENNAS
Analysis of the crossed dipole antenna as a model for aircraft in an electromagnetic environment A82-25002
Calculation and measurement of electric field strength for airborne antennas in the LF/HF range A82-25011
TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km [AD-A108182] N82-18464
Volumetric pattern prediction of antennas on aircraft using the geometrical theory of diffraction [ESA-TT-677] N82-18483
Assessment of aircraft capacitive circuit medium wave antennas according to their efficiency N82-19453

AIRCRAFT BRAKES
Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility [NASA-TP-1959] N82-18204

AIRCRAFT CARRIERS
Review of defense-related vertical and short takeoff and landing (V/STOL) aircraft programs [GPO-55-278] N82-18205
Investigation of crossdeck pendant catapult slot interaction; proposed corrective measures [AD-A108149] N82-18232
Descent-rate cuing for carrier landings: Effects of display gain, display noise and aircraft type [AD-A108801] N82-19206

AIRCRAFT COMMUNICATION
Voice communications - The vital link A82-23324
Beyond the horizon coverage for air navigation/traffic control A82-24647
Loran-C RNAV in mountainous areas A82-24649
Investigation of the effects of airborne installation factors on receiver interference N82-19422
FAA/FCC coordination procedures for FM broadcast stations N82-19423

AIRCRAFT COMPARTMENTS
Preliminary thoughts on helicopter cabin noise prediction methods N82-18148
The measurement of the mobility of structures at acoustic frequencies N82-18149
Study of cabin noise control for twin engine general aviation aircraft [NASA-CR-165833] N82-18995

AIRCRAFT CONFIGURATIONS
Transparency development needs for military aircraft in the 1980's A82-24302

AIRCRAFT CONSTRUCTION MATERIALS
Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings A82-24301
Aircraft transparency design guide A82-24307
B.A.C. One-Eleven flight deck glazing product improvement A82-24325
Concorde glazings - 5 years of Mach 2 service A82-24326
Materials aspects of aircraft EMC design A82-24358
Aircraft surface coatings for drag reduction/erosion protection [SAE PAPER 811070] A82-24401
Structural testing of composites with known defects A82-24708
Carbon-fiber composites - A fiber composite material for highly stressed light-construction components A82-24805
Recent developments in materials and processes for aircraft corrosion control A82-24825
A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials [NASA-CR-165763] N82-18327

AIRCRAFT CONTROL
Analysis and optimization of control systems in piloted flight vehicles --- Russian book A82-22398
Sensitivity reduction by double perfect model following --- with application to aircraft control A82-23029
Aircraft parameter identification in the presence of atmospheric turbulence A82-23227
Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, February 11, 12, 1981, Collection of Papers A82-23426
Fixed gain controller design for aircraft A82-23441
F/A-18 weapon system development A82-23774
MIL-STD 1553B - Aircraft EM environmental susceptibility effects A82-24357
Multivariable aircraft control by maneuver commands: An application to air to surface gunnery N82-19154
Transport aircraft cockpit standardization (Federal Aviation regulations part 25) [AD-A108924] N82-19207
A method for applying linear optimal control theory to the design of a regulator for a flexible aircraft --- improving riding quality in fighter aircraft [NLR-TR-80032-U] N82-19212

AIRCRAFT DESIGN
Complete guide to Rutan homebuilt aircraft --- Book A82-22880
History of the sweptback wing [DGLR PAPER 81-070] A82-22898
Fighters - Tomorrow's terminology A82-23368
Boeing's big, quiet 737-300 A82-23369
Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, February 11, 12, 1981, Collection of Papers A82-23426
YF-16 design concept and philosophy A82-23444
Design of supercritical swept wings A82-23826
A310 - Design for maintenance A82-24002
Development of maintenance programmes through the functional, structural and flight test phases A82-24003
Maintenance objectives for future aircraft A82-24005
What the operator wants --- airline cooperation in aircraft maintenance A82-24008
The inter-relation between design, construction and maintenance A82-24010
Air transport in the 21st century A82-24025
Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings A82-24301
Deficiencies and constraints that affect the design of cockpit enclosures and transparencies A82-24303
Fuel-efficient windshields for transport, commuter and business aircraft A82-24304
Transparencies - What an aircraft designer should know A82-24305
Transparency design decisions - Assessing their impact on visual performance A82-24306
Aircraft transparency design guide A82-24307

An analytical methodology to predict potential aircraft losses due to canopy birdstrikes A82-24313

The role of finite element analysis in the design of birdstrike resistant transparencies A82-24314

The development of high strength light-weight windshields for the new generation of Boeing 757 and 767 airliners A82-24323

Materials aspects of aircraft EMC design A82-24358

CAD/CAM in British Aerospace - Aircraft Group A82-24373

Application of damage tolerance technology to type certification [SAE PAPER 811062] A82-24388

Airworthiness considerations in the design of commercial transport aircraft [SAE PAPER 811039] A82-24396

Designing for continued airworthiness - General aviation [SAE PAPER 811038] A82-24397

Quality, quantity, and technology - A perspective on fighter development [SAE PAPER 811097] A82-24400

Future strike fighter options - Concepts and technologies [SAE PAPER 811099] A82-24403

Technology for quality and quantity in a new fighter [SAE PAPER 811100] A82-24404

Fighter issues - 2000 [SAE PAPER 811096] A82-24415

Development of a self-optimizing flexible technology /SOFT/ transonic wing wind tunnel model [AIAA 82-0601] A82-24673

Spoilers or auxiliary flaps A82-24973

Aircraft/airport compatibility - A constant challenge for aircraft designers A82-25119

The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators [AIAA PAPER 82-2635] A82-25154

Advanced electronic displays and their potential in future transport aircraft A82-25216

Tendencies in the development of subsonic transport aircraft with special consideration of aerodynamics [ESA-TT-705] N82-18214

Electric Flight Systems [NASA-CP-2209] N82-19134

Electric flight systems, overview N82-19135

The 400-Hertz constant-speed electrical generation systems N82-19139

Engine technology N82-19145

Power systems N82-19146

Electromechanical actuators N82-19148

Aeronautical Research Laboratories Structures Division [AD-A109049] N82-19161

Practical applications of fracture mechanics [AGARD-AG-257] N82-19571

AIRCRAFT DETECTION

Wide field of view laser beacon system for three-dimensional aircraft position measurement [ASME PAPER 81-WA/DSC-9] A82-24563

AIRCRAFT ENGINES

Lineup of the LM-series aircraft-derivative gas turbines A82-22896

Reliable power --- Rolls-Royce aircraft engine designs A82-24007

Monitoring engine wear by oil analysis A82-24012

Packaging the VSCF system for an aircraft engine environment A82-24383

RB 211 powerplant deterioration - Review of current situation and lessons learned [SAE PAPER 811053] A82-24393

High temperature engine control electronics [SAE PAPER 811074] A82-24407

Performance retention features of the PW2037 [SAE PAPER 811054] A82-24409

Reliability analysis of a dual-redundant engine controller [SAE PAPER 811077] A82-24410

Propulsion multiplexer /PMUX/ system - The missing link [SAE PAPER 811078] A82-24411

Novel metal-ceramics-composite sealing coatings in aircraft engines A82-24803

AFWAL turbine engine controls research and development - Present and future [AIAA PAPER 82-0321] A82-25050

Where is cobalt irreplaceable A82-25538

A digital simulation program describing the motion of an aircraft undergoing engine failure during its takeoff ground roll [AD-A108420] N82-18210

Further development of the test concept of the ALPHA JET engine LARZAC 04 N82-18223

Electric Flight Systems [NASA-CP-2209] N82-19134

Electric flight systems, overview N82-19135

A propulsion view of the all-electric airplane N82-19136

Potential propulsion considerations and study areas for all-electric aircraft N82-19137

A look into the future: The potential of the all-electric secondary power system for the energy efficient transport N82-19138

The 400-Hertz constant-speed electrical generation systems N82-19139

Electric ECS N82-19140

Environmental Control Systems N82-19141

Overview of Honeywell electromechanical actuation programs N82-19142

Digital flight controls N82-19143

Electric flight systems N82-19144

Engine technology N82-19145

Power systems N82-19146

Electromechanical actuators N82-19148

Digital flight controls N82-19149

Electric flight systems integration N82-19150

Practical applications of fracture mechanics [AGARD-AG-257] N82-19571

An experimental study of the effects of an inlet flow conditioner on the noise of a low speed axial flow fan --- in an aircraft engine [TT-8101] N82-19956

AIRCRAFT EQUIPMENT

Recent improvements in aircraft Ni-Cd cells A82-24245

The coupling of electromagnetic interference into aircraft systems A82-24354

MIL-STD 1553B - Aircraft EM environmental susceptibility effects A82-24357

Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981 [SAE SP-500] A82-24376

Design considerations of DC-Link aircraft generation systems A82-24377

Advanced generating system technology A82-24380

The effect of critical design parameters on the selection of a VSCF system A82-24381

F-100 AIRCRAFT
Acoustic measurements of F100-PW-100 engine operating in hush house NSN 4920-02-070-2721
[AD-A108814] N82-19952

F-111 AIRCRAFT
Mission-adaptive wing flight demonstration program
[SAE PAPER 811035] A82-24399

FABRICATION
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding
[AD-A109377] N82-19209

FAILURE ANALYSIS
Fatigue test of the typical main rotor controls component
A82-24715

Investigation of crossdeck pendant catapult slot interaction; proposed corrective measures
[AD-A108149] N82-18232

Disengagement of safety harness buckles - CT4
[AD-A109048] N82-19199

FASTENERS
A compilation of stress intensity factor solutions for flawed fastener holes
[AD-A108753] N82-18628

Disengagement of safety harness buckles - CT4
[AD-A109048] N82-19199

FATIGUE (MATERIALS)
Material/structure degradation due to fretting and fretting-initiated fatigue
A82-23771

Standardization of helicopter fatigue methodology - A manufacturer's view
A82-24704

Fatigue test of the typical main rotor controls component
A82-24715

Helicopter rotor load prediction
A82-24719

Fracture and fatigue characterization of aircraft structural materials under biaxial loading
[AD-A109054] N82-19507

FATIGUE LIFE
On the sonic fatigue life estimation of skin structures at room and elevated temperatures
A82-23670

Application of damage tolerance technology to type certification
[SAE PAPER 811062] A82-24388

The Agusta's solution of AHS's hypothetical fatigue life problem
A82-24701

The challenge of standardizing fatigue methodology
A82-24703

Application of fatigue, crack propagation and strain survey testing to the CH-46 aft rotor drive shaft
A82-24705

A method of determining safe service life for helicopter components
A82-24709

Hughes helicopters - Fatigue life methodology
A82-24710

Fundamentals of helicopter fatigue life determination
A82-24714

Hypothetical fatigue life problem - Application of Aerospatiale method
A82-24716

Boeing Vertol fatigue life methodology
A82-24718

Acoustic fatigue endurance test of USB flap structure models at elevated temperature
[NAL-TR-683] N82-19570

FATIGUE TESTS
The challenge of standardizing fatigue methodology
A82-24703

NDE of composite rotor blades during fatigue testing
A82-24713

Fundamentals of helicopter fatigue life determination
A82-24714

Fatigue test of the typical main rotor controls component
A82-24715

Advanced attack helicopter fatigue testing - Overview
A82-24720

FEEDBACK CONTROL
Sensitivity reduction by double perfect model following --- with application to aircraft control
A82-23029

FERROGRAPHY
Monitoring engine wear by oil analysis
A82-24012

FIBER COMPOSITES
Carbon-fiber composites - A fiber composite material for highly stressed light-construction components
A82-24805

FIBER REINFORCED COMPOSITES
Certification of civil composite aircraft structure
[SAE PAPER 811061] A82-24389

NDE of composite rotor blades during fatigue testing
A82-24713

FIGHTER AIRCRAFT
Fighters - Tomorrow's terminology
A82-23368

An analytical methodology to predict potential aircraft losses due to canopy birdstrikes
A82-24313

The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
[SAE PAPER 811036] A82-24398

Quality, quantity, and technology - A perspective on fighter development
[SAE PAPER 811097] A82-24400

Future strike fighter options - Concepts and technologies
[SAE PAPER 811099] A82-24403

Technology for quality and quantity in a new fighter
[SAE PAPER 811100] A82-24404

Fighter issues - 2000
[SAE PAPER 811096] A82-24415

The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators
[AIAA PAPER 82-2635] A82-25154

Theoretical investigations on the influence of different strake, tail unit, and conventional HLW arrangement as well as of CCV on the aerodynamic characteristics of fighter aircraft configurations
[MBB-FE-122/S/PUB/36] N82-18211

FILAMENT WINDING
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding
[AD-A109377] N82-19209

FINITE DIFFERENCE THEORY
Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
[ASME PAPER 81-WA/NCA-13] A82-24602

FINITE ELEMENT METHOD
The role of finite element analysis in the design of birdstrike resistant transparencies
A82-24314

High speed VSCF generator design consideration --- computer aided design for Variable Speed Constant Frequency generator
A82-24379

Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127

A study of the techniques of dynamic analysis of helicopter type structures
N82-18129

Interpretation and construction of a dynamic similarity model of the A 310 wings
[MBB-FE-17/S/PUB/42] N82-18212

Characterization of the Airbus horizontal stabilizers of CFRP construction and structural analysis with the finite element method
[MBB-UT-13-81-O] N82-18213

FIRE CONTROL
The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
[SAE PAPER 811036] A82-24398

Multivariable aircraft control by maneuver commands: An application to air to surface gunnery
N82-19154

FIRE DAMAGE
Workshop on Mathematical Fire Modeling
[AD-A108876] N82-19343

FIRE FIGHTING
  Evaluation of the North Island A/C crash/rescue training facility
  [AD-A108740] N82-18228
FIRE PREVENTION
  An assessment of the crash fire hazard of liquid hydrogen fueled aircraft
  [NASA-CR-165526] N82-19196
  Workshop on Mathematical Fire Modeling
  [AD-A108876] N82-19343
FIRST AID
  Importance of a tactical cargo aircraft in emergency relief
  A82-25499
FLAPPING
  A simplified method for predicting rotor blade airloads
  N82-18124
  A further study of helicopter rotor pitch-flap-phase coupling
  [BU-259] N82-19214
FLAPS (CONTROL SURFACES)
  Spoilers or auxiliary flaps
  A82-24973
FLEXIBLE WINGS
  Development of a self-optimizing flexible technology /SOFT/ transonic wing wind tunnel model
  [AIAA 82-0601] A82-24673
  A method for applying linear optimal control theory to the design of a regulator for a flexible aircraft --- improving riding quality in fighter aircraft
  [NLR-TR-80032-U] N82-19212
FLIGHT CHARACTERISTICS
  Aircraft parameter identification in the presence of atmospheric turbulence
  A82-23227
  A complete method for computation of blade mode characteristics and responses in forward flight
  N82-18126
  Flight characteristics design and development of the MBB/KHI BK117 helicopter
  N82-18150
  An analytical investigation of the free-tip rotor for helicopters
  [NASA-TM-81345] N82-18179
FLIGHT CONDITIONS
  Flight condition recognition /FCR/ technique --- microprocessor-based recording for helicopter structural component fatigue damage
  A82-24712
FLIGHT CONTROL
  The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
  [SAE PAPER 811036] A82-24398
  A redundancy concept for a digital CSAS
  N82-18170
  The influence of sensor and actuator characteristics on overall helicopter AFCS design
  N82-18171
  Integration of inertial sensors in helicopters
  N82-18173
  Integrated control design techniques
  [AD-A108223] N82-18224
  Apparatus for damping operator induced oscillations of a controlled system --- flight control
  [NASA-CASE-FRC-11041-1] N82-18483
  Electric Flight Systems
  [NASA-CP-2209] N82-19138
  Overview of Honeywell electromechanical actuation programs
  N82-19142
  Digital flight controls
  N82-19143
  Digital flight controls
  N82-19149
  Electric flight systems integration
  N82-19150
  Multivariable aircraft control by maneuver commands: An application to air to surface gunnery
  N82-19154
  A study of flight control requirements for advanced, winged, earth-to-orbit vehicles with far-aft center-of-gravity locations
  [NASA-CR-3491] N82-19226
FLIGHT CREWS
  Aircrew Restraint and mobility test fixture
  [AD-A108274] N82-18193
FLIGHT HAZARDS
  The requirements for reduced IFR separations on final approach
  A82-23311
FLIGHT INSTRUMENTS
  Electronic flight instrument systems /EFIS/, the instrumentation of the 1980s
  A82-25324
FLIGHT LOAD RECORDERS
  Operating flight loads and their effect on engine performance
  [SAE PAPER 811071] A82-24405
  Flight test data acquisition and interpretation
  A82-24707
  Flight condition recognition /FCR/ technique --- microprocessor-based recording for helicopter structural component fatigue damage
  A82-24712
FLIGHT MECHANICS
  Efficient combinations of numerical techniques applied to aircraft turning performance optimization
  A82-24814
FLIGHT OPERATIONS
  Operational air traffic in the Federal Republic of Germany
  A82-23318
  Operating flight loads and their effect on engine performance
  [SAE PAPER 811071] A82-24405
FLIGHT OPTIMIZATION
  Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning
  A82-23470
  Efficient combinations of numerical techniques applied to aircraft turning performance optimization
  A82-24814
FLIGHT PATHS
  Midair and near midair collisions on two- and three-dimensional curvilinear flight paths
  [ESA-TT-685] N82-18200
  Optimal aircraft landing patterns for minimal noise impact
  N82-19200
  A concept for a fuel efficient flight planning aid for general aviation
  [NASA-CR-3533] N82-19217
FLIGHT PLANS
  Wind and temperature database for flight planning
  [SAE PAPER 811068] A82-24385
  Airline flight planning - The weather connection
  [SAE PAPER 811067] A82-24386
  A concept for a fuel efficient flight planning aid for general aviation
  [NASA-CR-3533] N82-19217
FLIGHT SAFETY
  Analysis of system problems using aviation safety reporting system data
  A82-23312
  Operational air traffic in the Federal Republic of Germany
  A82-23318
  Voice communications - The vital link
  A82-23324
  Active Beacon Collision Avoidance System (BCAS) logic performance during operational flight tests
  [AD-A108893] N82-19203
FLIGHT SIMULATION
  Mission-adaptive wing flight demonstration program
  [SAE PAPER 811035] A82-24397
  The role of simulation in the design process
  N82-18156
  Rotorcraft flight simulation computer program C81 with DATAMAP interface. Volume 2: Programmer's manual
  [AD-A108294] N82-18231
  A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors
  [RAE-TM-RAD-NAV-145] N82-18503
  Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane
  [NASA-TP-1966] N82-19225

Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States
A82-24382
Aircraft electric system development and test facilities
A82-24384
The cargo helicopter - A logistical vehicle
A82-24717
Aircrew restraint and mobility test fixture
[AD-A108274] N82-18193

AIRCRAFT FUELS
Low grade fuels for turbo and jet engines
A82-23439
An assessment of the crash fire hazard of liquid hydrogen fueled aircraft
[NASA-CR-165526] N82-19196

AIRCRAFT HAZARDS
An analytical methodology to predict potential aircraft losses due to canopy birdstrikes
A82-24313
The effects of bird orientation on load profile and damage level
A82-24316
An assessment of the crash fire hazard of liquid hydrogen fueled aircraft
[NASA-CR-165526] N82-19196
Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane
[NASA-TP-1966] N82-19225
Workshop on Mathematical Fire Modeling
[AD-A108876] N82-19343

AIRCRAFT INDUSTRY
Experience during the development of the German-Japanese helicopter BK 117
[MBB-UD-318-81-O] N82-19210

AIRCRAFT INSTRUMENTS
The multi mode matrix flat panel display: Technology and applications
N82-18169
Analytical study of cockpit information requirements
[AD-A108524] N82-18218
Integration of complex systems in current and future aircraft projects for the example of avionics
[MBB-UH-18-80-O] N82-18221
Transport aircraft cockpit standardization (Federal Aviation regulations part 25)
[AD-A108924] N82-19207

AIRCRAFT LANDING
Methodology for multiaircraft minimum noise impact landing trajectories
A82-23037
Oscillations and vibrations of aircraft on runways
A82-24974
The toll of ILS-preventable aviation accidents
A82-25325
Optimal aircraft landing patterns for minimal noise impact
N82-19200
Descent-rate cuing for carrier landings: Effects of display gain, display noise and aircraft type
[AD-A108801] N82-19206

AIRCRAFT MAINTENANCE
Reliability centered maintenance /RCM/
A82-24001
A310 - Design for maintenance
A82-24002
Development of maintenance programmes through the functional, structural and flight test phases
A82-24003
Maintenance objectives for future aircraft
A82-24005
What the operator wants --- airline cooperation in aircraft maintenance
A82-24008
The way ahead for helicopter maintenance
A82-24009
The inter-relation between design, construction and maintenance
A82-24010
MSG-3 structures --- inspection program for aircraft maintenance
A82-24011
MSG-3 overview --- aircraft maintenance program development
A82-24014
Cost of ownership advantages with a shared oil system
A82-24378
Management of powerplant maintenance and restoration programs for fuel conservation
[SAE PAPER 811052] A82-24394
Potential reductions in aircraft operation and maintenance costs by using thrust computing support equipment
[AD-A108463] N82-18207

AIRCRAFT MANEUVERS
Utilizing the helicopter's versatility to improve the ATC system
A82-23316
Efficient combinations of numerical techniques applied to aircraft turning performance optimization
A82-24814
Multivariable aircraft control by maneuver commands: An application to air to surface gunnery
N82-19154

AIRCRAFT MODELS
Analysis of the crossed dipole antenna as a model for aircraft in an electromagnetic environment
A82-25002
Prediction of off-design performance of turbo-shaft engines a simplified method
N82-18132
Measurement techniques used to assess the installed power of a helicopter engine
N82-18133
Parametric criteria and impact on design trends
N82-18139
Interpretation and construction of a dynamic similarity model of the A 310 wings
[MBB-FE-17/S/PUB/42] N82-18212
Design study into a high endurance mini-rotorcraft
[BU-265] N82-19216
Structural system identification technology verification
[AD-A109181] N82-19583

AIRCRAFT NOISE
Direct comparison of community response to road traffic noise and to aircraft noise
A82-22974
Methodology for multiaircraft minimum noise impact landing trajectories
A82-23037
Study of cabin noise control for twin engine general aviation aircraft
[NASA-CR-165833] N82-18995
Annoyance caused by propeller airplane flyover noise: Preliminary results
[NASA-TM-83244] N82-18996
Optimal aircraft landing patterns for minimal noise impact
N82-19200
Airport related residential acoustical insulation demonstration project: Report 1720
[PB82-100777] N82-19396
Effects of repetition rate and impulsiveness of simulated helicopter rotor noise on annoyance
[NASA-TP-1969] N82-19707
Aircraft noise prediction program theoretical manual, part 1
[NASA-TM-83199-PT-1] N82-19946
Aircraft noise prediction program theoretical manual, part 2
[NASA-TM-83199-PT-2] N82-19947
Noise measurements on the helicopter BK 117 design. Weighted noise levels and influence of airspeed
[DFVLR-MITT-81-18] N82-19957
Collection and evaluation of propeller aircraft noise certification data
[DFVLR-MITT-81-20] N82-19958

AIRCRAFT PARTS
The inter-relation between design, construction and maintenance
A82-24010
Lucas stretched acrylic
A82-24318
The Agusta's solution of AHS's hypothetical fatigue life problem
A82-24701
A method of determining safe service life for helicopter components
A82-24709

Boeing Vertol fatigue life methodology
A82-24718
Advanced attack helicopter fatigue testing - Overview
A82-24720
AIRCRAFT PERFORMANCE
Boeing's big, quiet 737-300
A82-23369
Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, February 11, 12, 1981, Collection of Papers
A82-23426
YF-16 design concept and philosophy
A82-23444
Maintenance objectives for future aircraft
A82-24005
Quality, quantity, and technology - A perspective on fighter development
[SAE PAPER 811097] A82-24400
Restoration of performance, Models 727, 737, and 747
[SAE PAPER 811072] A82-24406
Fighter issues - 2000
[SAE PAPER 811096] A82-24415
SH-60B test program
N82-18141
C-5A austere airfield operational utility evaluation. Phase 2: Operation on unpaved soil surfaces following rainfall
[AD-A108597] N82-18208
AIRCRAFT PRODUCTION
The inter-relation between design, construction and maintenance
A82-24010
CAD/CAM in British Aerospace - Aircraft Group
A82-24373
Technology for quality and quantity in a new fighter
[SAE PAPER 811100] A82-24404
AIRCRAFT PRODUCTION COSTS
Impact of technology on avionics cost trends
[AD-A108494] N82-18219
AIRCRAFT RELIABILITY
Reliability centered maintenance /RCM/
A82-24001
Airworthiness regulation: What is our strategy - What are the issues
A82-24006
The way ahead for helicopter maintenance
A82-24009
MSG-3 overview --- aircraft maintenance program development
A82-24014
Airworthiness considerations in the design of commercial transport aircraft
[SAE PAPER 811039] A82-24396
Designing for continued airworthiness - General aviation
[SAE PAPER 811038] A82-24397
Reliability analysis of a dual-redundant engine controller
[SAE PAPER 811077] A82-24410
Hypothetical fatigue life problem - Application of Aerospatiale method
A82-24716
The reliability and safety of small passenger aircraft
A82-24972
Point of view of a helicopter manufacturer on airworthiness regulations
N82-18137
Aeronautical Research Laboratories Structures Division
[AD-A109049] N82-19161
AIRCRAFT SAFETY
MSG-3 overview --- aircraft maintenance program development
A82-24014
Designing for continued airworthiness - General aviation
[SAE PAPER 811038] A82-24397
Scanning strategies for air traffic control radars
A82-24646
Standardization of helicopter fatigue methodology - A manufacturer's view
A82-24704
Flight test data acquisition and interpretation
A82-24707
The reliability and safety of small passenger aircraft
A82-24972
Point of view of a helicopter manufacturer on airworthiness regulations
N82-18137
Electrical ground testing of aircraft antistatic protection
N82-19156
Disengagement of safety harness buckles - CH4
[AD-A109048] N82-19199
Active Beacon Collision Avoidance System (BCAS) logic performance during operational flight tests
[AD-A108893] N82-19203
Workshop on Mathematical Fire Modeling
[AD-A108876] N82-19343
AIRCRAFT SPECIFICATIONS
Point of view of a helicopter manufacturer on airworthiness regulations
N82-18137
Army Lynx: Product development matched to military combat development
N82-18143
A light helicopter for night firing
N82-18144
AIRCRAFT SPIN
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183
A criterion for the prediction of the recovery characteristics of spinning aircraft
[RAE-TR-AERO-2251] N82-19223
An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft --- static wind tunnel force measurements
[NASA-CR-168578] N82-19224
AIRCRAFT STABILITY
Aircraft parameter identification in the presence of atmospheric turbulence
A82-23227
AIRCRAFT STRUCTURES
On the sonic fatigue life estimation of skin structures at room and elevated temperatures
A82-23678
Novel approaches to electron beam welding machine utilization
A82-23753
Diffusion bonding in superplastic forming/diffusion bonding
A82-23754
Aluminum and its alloys - Weldability
A82-23755
Material/structure degradation due to fretting and fretting-initiated fatigue
A82-23771
A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum
A82-23772
MSG-3 structures --- inspection program for aircraft maintenance
A82-24011
Transparency development needs for military aircraft in the 1980's
A82-24302
Portable transparency optical test system /P-TOTS/
A82-24309
Windshield system structural enhancement
A82-24312
D.C.9 windshield - Effect of attachment retorque
A82-24324
Application of damage tolerance technology to type certification
[SAE PAPER 811062] A82-24388
Certification of civil composite aircraft structure
[SAE PAPER 811061] A82-24389
Standardization of helicopter fatigue methodology - A manufacturer's view
A82-24704
The effects of slight non-linearities on modal testing of helicopter-like structures
N82-18130
Theoretical investigations on the influence of different strake, tail unit, and conventional HLW arrangement as well as of CCV on the aerodynamic characteristics of fighter aircraft configurations
[MBB-FE-122/S/PUB/30] N82-18211
Interpretation and construction of a dynamic similarity model of the A 310 wings
[MBB-FE-17/S/PUB/42] N82-18212

FLIGHT SIMULATORS

Task analytic techniques: Application to the design of a flight simulator instructor/operator console [AD-A108724] N82-18227

Equipment for testing and measuring a "helmet mounted sight and display" system with a coupled movable TV camera in the flight simulator for research of the DFVLR [ESA-TT-675] N82-19219

FLIGHT TESTS

F/A-18 weapon system development A82-23774

LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System [SAE PAPER 811080] A82-24412

Loran-C RNAV in mountainous areas A82-24649

Flight test data acquisition and interpretation A82-24707

Measurement techniques used to assess the installed power of a helicopter engine N82-18133

SH-60B test program N82-18141

Evaluation of the helicopter low airspeed system LASSIE N82-18172

A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors [RAE-TM-RAD-NAV-145] N82-18503

Active Beacon Collision Avoidance System (BCAS) logic performance during operational flight tests [AD-A108893] N82-19203

FLIGHT TRAINING

Computer-generated images for simulators - The cost of technology A82-22881

Task analytic techniques: Application to the design of a flight simulator instructor/operator console [AD-A108724] N82-18227

FLIGHT VEHICLES

Analysis and optimization of control systems in piloted flight vehicles --- Russian book A82-22398

FLOW DISTRIBUTION

The problem of calculation of the flow around helicopter rotor blade tips N82-18160

Separated flow around helicopter bodies N82-18163

A method of predicting fuselage loads in hover N82-18164

On the calculation of separated flow on helicopter fuselages [MBB-UD-321-81-O] N82-18188

Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane [NASA-TP-1966] N82-19225

The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel [BU-263] N82-19231

FLOW EQUATIONS

A complete method for computation of blade mode characteristics and responses in forward flight N82-18126

FLOW MEASUREMENT

Evaluation of the helicopter low airspeed system LASSIE N82-18172

FLOW REGULATORS

An ejector augmented choking valve for the metering and control of inlet and bleed duct flows [AIAA 82-0575] A82-24659

FLOW VELOCITY

Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet [ASME PAPER 81-WA/FE-3] A82-24566

FLUID MECHANICS

Annual review of fluid mechanics. Volume 14 --- Book A82-24416

FLUTTER

Flutter and time response analyses of three degree of freedom airfoils in transonic flow [AD-A108987] N82-19227

Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts [MBB-FE-172/S/PUB/39-PT-1] N82-19228

FLUTTER ANALYSIS

Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance [AIAA PAPER 80-0724] A82-24022

Recent developments in wing with stores flutter suppression [ONERA, TP NO. 1981-145] A82-24077

FORCED VIBRATION

Cross and cross-coupling derivative measurements on the standard dynamics model at AEDC [AIAA 82-0596] A82-24670

FORECASTING

Report of the Air Traffic Forecasting Working Party, 1981 N82-19195

FORGING

Practical applications of fracture mechanics [AGARD-AG-257] N82-19571

FORMING TECHNIQUES

Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures [NASA-CR-165827] N82-19358

FRACTURE MECHANICS

Practical applications of fracture mechanics [AGARD-AG-257] N82-19571

Fracture and fatigue characterization of aircraft structural materials under biaxial loading [AD-A109054] N82-19587

FRACTURE STRENGTH

The effects of absorbed moisture upon the physical properties of stretched acrylic materials A82-24320

Application of damage tolerance technology to type certification [SAE PAPER 811062] A82-24388

FREE FLOW

Static pressure in the slipstream of a propeller A82-24023

FREQUENCY STABILITY

Advanced generating system technology A82-24380

The effect of critical design parameters on the selection of a VSCF system A82-24381

Packaging the VSCF system for an aircraft engine environment A82-24383

FREQUENCY STANDARDS

Global positioning system timing receivers in the DSN N82-20126

FRESNEL LENSES

Descent-rate cuing for carrier landings: Effects of display gain, display noise and aircraft type [AD-A108801] N82-19206

FRETTING CORROSION

Material/structure degradation due to fretting and fretting-initiated fatigue A82-23771

FUEL COMBUSTION

Fuel-rich plume combustion [AD-A108136] N82-18349

FUEL CONSUMPTION

Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning A82-23470

Fuel-efficient windshields for transport, commuter and business aircraft A82-24304

Integration of energy management concepts into the flight deck [SAE PAPER 811066] A82-24387

Management of powerplant maintenance and restoration programs for fuel conservation [SAE PAPER 811052] A82-24394

Airline fuel saving through JT9D engine refurbishment [SAE PAPER 811051] A82-24395

Restoration of performance, Models 727, 737, and 747 [SAE PAPER 811072] A82-24406

Developments in rotary wing aircraft aerodynamics N82-18120

Parametric study of the influence of the engine upon the operating cost of a civil helicopter
N82-18131
Component design and development for future helicopter engines
N82-18134
A concept for a fuel efficient flight planning aid for general aviation
[NASA-CR-3533] N82-19217

FUEL CORROSION
Improving the accuracy of the estimates of surfactant content in jet fuels
A82-23250

FUELS
A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials
[NASA-CR-165763] N82-18327

FULL SCALE TESTS
Slotted wall test section for automotive aerodynamic test facilities
[AIAA 82-0585] A82-24661
Status and capabilities of the National Full Scale Facility 40- by 80-foot wir . tunnel modification
[AIAA 82-0607] A82-24676

FUSELAGES
Flight characteristics design and development of the MBB/KHI BK117 helicopter
N82-18150
Separated flow around helicopter bodies
N82-18163
A method of predicting fuselage loads in hover
N82-18164
On the calculation of separated flow on helicopter fuselages
[MBB-UD-321-81-O] N82-18188
Structural system identification technology verification
[AD-A109181] N82-19583

FUSION WELDING
Aluminum and its alloys - Weldability
A82-23755

G

GAS STREAMS
Dilution jet behavior in the turn section of a reverse flow combuster
[NASA-TM-82776] N82-19220

GAS TURBINE ENGINES
Lineup of the IM-series aircraft-derivative gas turbines
A82-22896
Reliable power --- Rolls-Royce aircraft engine designs
A82-24007
AFWAL turbine engine controls research and development - Present and future
[AIAA PAPER 82-0321] A82-25050
Component design and development for future helicopter engines
N82-18134
Dilution jet behavior in the turn section of a reverse flow combuster
[NASA-TM-82776] N82-19220
Cooled variable-area radial turbine technology program
[NASA-CR-165408] N82-19221

GEAR TEETH
The measurement of the mobility of structures at acoustic frequencies
N82-18149

GEARS
Cost of ownership advantages with a shared oil system
A82-24378

GENERAL AVIATION AIRCRAFT
Designing for continued airworthiness - General aviation
[SAE PAPER 811038] A82-24397
Study of cabin noise control for twin engine general aviation aircraft
[NASA-CR-165833] N82-18995
Bibliography of NASA published reports on general aviation, 1975 to 1981
[NASA-TM-83307] N82-19132
A design study of the Marshal --- lightweight twin-engined aircraft
[BU-262] N82-19215
A concept for a fuel efficient flight planning aid for general aviation
[NASA-CR-3533] N82-19217
An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft --- static wind tunnel force measurements
[NASA-CR-168578] N82-19224

GEOMETRIC DILUTION OF PRECISION
Improvements and extensions of the Geometrical Dilution of Precision (GDOP) concept for selecting navigation measurements
[AD-A108607] N82-18197

GEOMETRICAL THEORY OF DIFFRACTION
GTD terrain reflection model applied to ILS glide scope --- Geometrical Theory of Diffraction
A82-23027
Volumetric pattern prediction of antennas on aircraft using the geometrical theory of diffraction
[ESA-TT-677] N82-18483

GEOPOTENTIAL HEIGHT
Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data
A82-25113

GLAZES
B.A.C. One-Eleven flight deck glazing product improvement
A82-24325
Concorde glazings - 5 years of Mach 2 service
A82-24326

GLIDE PATHS
GTD terrain reflection model applied to ILS glide scope --- Geometrical Theory of Diffraction
A82-23027

GLIDERS
On the design of some airfoils for sailplane application --- additions to existing wings for inflight testing
[VTH-LR-326] N82-19213

GLOBAL POSITIONING SYSTEM
Institute of Navigation, Annual Meeting, 37th, U.S. Naval Academy, Annapolis, MD, June 9-11, 1981, Proceedings
A82-24643
A marine NAVSTAR GPS receiver
A82-24644
The application of NAVSTAR differential GPS in the civilian community
A82-24645
Improvements and extensions of the Geometrical Dilution of Precision (GDOP) concept for selecting navigation measurements
[AD-A108607] N82-18197
Global positioning system timing receivers in the DSN
N82-20126

GOGGLES
Experimental investigation of visual aids for helicopters: Low level flight at night and poor visibility
N82-18168

GOVERNMENT/INDUSTRY RELATIONS
International plans for civil and military co-ordination
A82-23317

GRAPHITE-EPOXY COMPOSITES
A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials
[NASA-CR-165763] N82-18327

GROUND BASED CONTROL
Stereographic projection in the National Airspace System
A82-23031

GROUND EFFECT (COMMUNICATIONS)
Loran-C RNAV in mountainous areas
A82-24649

GROUND SPEED
A digital simulation program describing the motion of an aircraft undergoing engine failure during its takeoff ground roll
[AD-A108420] N82-18210

GROUND STATIONS
Analysis of loran-C system reliability for civil aviation
A82-24650

- Characterization of the Airbus horizontal stabilizers of CFRP construction and structural analysis with the finite element method [MBB-UT-13-81-O] N82-18213
- A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials [NASA-CR-165763] N82-18327
- Electroforming of space and aircraft structures [MBB-BB-491-O] N82-18419
- Aeronautical Research Laboratories Structures Division [AD-A109049] N82-19161
- Practical applications of fracture mechanics [AGARD-AG-257] N82-19571
- Structural system identification technology verification [AD-A109181] N82-19583

AIRCRAFT SURVIVABILITY
- Fighter issues - 2000 [SAE PAPER 811096] A82-24415
- Evolution of the Aeroscout A82-24706
- Army Lynx: Product development matched to military combat development N82-18143
- A light helicopter for night firing N82-18144

AIRCRAFT TIRES
- Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility [NASA-TP-1959] N82-18204

AIRCRAFT WAKES
- The requirements for reduced IFR separations on final approach A82-23311
- Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane [NASA-TP-1966] N82-19225

AIRFOIL PROFILES
- A new facility and technique for two-dimensional aerodynamic testing [AIAA 82-0608] A82-24677
- Investigations of the separation behavior on airfoils at high angles of attack, using linear lift theory [MBB-FE-122/S/PUB/37] N82-18189
- Laminar airfoils for transport aircraft [ESA-TT-680] N82-18190
- On the design of some airfoils for sailplane application --- additions to existing wings for inflight testing [VTH-LR-326] N82-19213

AIRFRAME MATERIALS
- Fracture and fatigue characterization of aircraft structural materials under biaxial loading [AD-A109054] N82-19587

AIRFRAMES
- Welding for low-cost advanced titanium airframe structures A82-23757
- Material/structure degradation due to fretting and fretting-initiated fatigue A82-23771
- Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance [AIAA PAPER 80-0724] A82-24022
- Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures [NASA-CR-165827] N82-19358

AIRLINE OPERATIONS
- Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning A82-23470
- What the operator wants --- airline cooperation in aircraft maintenance A82-24008
- MSG-3 overview --- aircraft maintenance program development A82-24014
- Wind and temperature database for flight planning [SAE PAPER 811068] A82-24385
- Airline flight planning - The weather connection [SAE PAPER 811067] A82-24386
- Integration of energy management concepts into the flight deck [SAE PAPER 811066] A82-24387
- Report of the Air Traffic Forecasting Working Party, 1981 N82-19195

AIRPORT PLANNING
- Methodology for multiaircraft minimum noise impact landing trajectories A82-23037
- Aircraft/airport compatibility - A constant challenge for aircraft designers A82-25119

AIRPORTS
- Utilization of radio equipment at airports and on airways --- Russian book A82-22407
- Development of a clear air radar to detect meteorological hazards at airports [AD-A108236] N82-18835
- FAA statistical handbook of aviation [AD-A109289] N82-19198

AIRSPACE
- International plans for civil and military co-ordination A82-23317

AIRSPEED
- Evaluation of the helicopter low airspeed system LASSIE N82-18172
- Noise measurements on the helicopter BK 117 design. Weighted noise levels and influence of airspeed [DFVLR-MITT-81-18] N82-19957

ALASKA
- United States Coast Pilot 9. Pacific and Arctic Coasts Alaska: Cape Spencer to Beaufort Sea [PB82-109562] N82-18201

ALPHA PARTICLES
- Linear alpha-ray altimeter A82-23225

ALTIMETERS
- Linear alpha-ray altimeter A82-23225

ALTITUDE
- Analysis of a nonlinear altitude tracking method [AD-A108878] N82-19197

ALUMINUM ALLOYS
- Aluminum and its alloys - Weldability A82-23755
- A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum A82-23772

ANGLE OF ATTACK
- Oscillating supersonic/hypersonic wings at high incidence A82-23828
- Review of support interference in dynamic tests [AIAA 82-0594] A82-24668
- Investigations of the separation behavior on airfoils at high angles of attack, using linear lift theory [MBB-FE-122/S/PUB/37] N82-18189

ANTENNA ARRAYS
- Antenna (selected articles) [AD-A108174] N82-19448

ANTENNA DESIGN
- Antenna (selected articles) [AD-A108174] N82-19448

ANTENNA RADIATION PATTERNS
- TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km [AD-A108182] N82-18464
- Volumetric pattern prediction of antennas on aircraft using the geometrical theory of diffraction [ESA-TT-677] N82-18483
- Antenna (selected articles) [AD-A108174] N82-19448

ANTENNAS
- Assessment of aircraft capacitive circuit medium wave antennas according to their efficiency N82-19453

ANTIMISSILE DEFENSE
- Perspectives for Controlled Weapons Technology: Report of the 90th Helicopter Forum [MBB-UA-532-80-O] N82-19211

ANTIREFLECTION COATINGS
- Reducing reflections on the front surface of air traffic control displays A82-23314

ANTISKID DEVICES
Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility
[NASA-TP-1959] N82-18204
APPLICATIONS PROGRAMS (COMPUTERS)
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127
ARCHITECTURE
Airport related residential acoustical insulation demonstration project: Report 1720
[PB82-100777] N82-19396
ARCHITECTURE (COMPUTERS)
ATC automation - A look forward: Technology/architecture
A82-23320
Discrete Address Beacon System /DABS/
A82-23322
ARRESTING GEAR
Investigation of crossdeck pendant catapult slot interaction; proposed corrective measures
[AD-A108149] N82-18232
ARTIFICIAL CLOUDS
Helicopter Icing Spray System (HISS) nozzle improvement evaluation
[AD-A109405] N82-19208
ASPECT RATIO
Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82
[NASA-TP-1974] N82-19222
ATMOSPHERIC CIRCULATION
Aircraft measurements and analysis of severe storms: 1976 field experiment
[NASA-CR-168519] N82-18803
ATMOSPHERIC SOUNDING
Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data
A82-25113
ATMOSPHERIC TEMPERATURE
Wind and temperature database for flight planning
[SAE PAPER 811068] A82-24305
ATMOSPHERIC TURBULENCE
Aircraft parameter identification in the presence of atmospheric turbulence
A82-23227
ATMOSPHERICS
TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km
[AD-A108182] N82-18469
ATTACK AIRCRAFT
Aircrew restraint and mobility test fixture
[AD-A108274] N82-18193
AUTOMATED EN ROUTE ATC
Air Traffic Control computer replacement - Specification issues and problems
A82-23313
NAS system load - Utilization of the DARC system
A82-23315
ATC automation - A look forward: Technology/architecture
A82-23320
AUTOMATIC CONTROL
Three-engine control system for the prototype EH-101 helicopter
[AERG-9/81-1568L] N82-18135
AUTOMATIC FLIGHT CONTROL
A control model for maneuvering flight for application to a computer-flight testing program
N82-18153
AUTOMATIC TRAFFIC ADVISORY AND RESOLUTION
Conflicts between random flights in a given area
A82-25213
AUTOMOBILES
Slotted wall test section for automotive aerodynamic test facilities
[AIAA 82-0585] A82-24661
AUXILIARY POWER SOURCES
Electric Flight Systems
[NASA-CP-2209] N82-19134
Electric flight systems, overview
N82-19135
Electric ECS
N82-19140
Electric flight systems integration
N82-19150
AVIONICS
The use of dynamic mock-ups in the design of advanced systems --- USAF's Digital Avionic Information System and NAVY's Advanced Integrated Display System
A82-22902
The coupling of electromagnetic interference into aircraft systems
A82-24354
The variation of induced currents in aircraft wiring
A82-24355
EMC clearance of modern military aircraft
A82-24359
The testing of aircraft under near field conditions
A82-24361
Advanced electronic displays and their potential in future transport aircraft
A82-25216
Electronic flight instrument systems /EFIS/, the instrumentation of the 1980s
A82-25324
The role of simulation in the design process
N82-18154
Integration of inertial sensors in helicopters
N82-18173
Impact of technology on avionics cost trends
[AD-A108494] N82-18219
Trends in airline avionics
[NLR-MP-80013-U] N82-18220
Integration of complex systems in current and future aircraft projects for the example of avionics
[MBB-UH-18-80-O] N82-18221
A-7E software module guide
[AD-A108649] N82-18920
Assessment of Avionic Equipment Field Reliability and Maintainability as Functions of Unit Cost
[AD-A109373] N82-19210
AXIAL FLOW TURBINES
An experimental study of the effects of an inlet flow conditioner on the noise of a low speed axial flow fan --- in an aircraft engine
[TT-8101] N82-19956
AXIAL LOADS
Fracture and fatigue characterization of aircraft structural materials under biaxial loading
[AD-A109054] N82-19507
AXIAL STRAIN
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230

B

BASE PRESSURE
A method of predicting fuselage loads in hover
N82-18160
BEACON COLLISION AVOIDANCE SYSTEM
Analysis of a nonlinear altitude tracking method
[AD-A108870] N82-19197
Active Beacon Collision Avoidance System (BCAS) logic performance during operational flight tests
[AD-A108893] N82-19203
BEAUFORT SEA (NORTH AMERICA)
United States Coast Pilot 9. Pacific and Arctic Coasts Alaska: Cape Spencer to Beaufort Sea
[PB82-109562] N82-18201
BENDING MOMENTS
A method for applying linear optimal control theory to the design of a regulator for a flexible aircraft --- improving riding quality in fighter aircraft
[NLR-TR-80032-U] N82-19212
BIBLIOGRAPHIES
Bibliography of NASA published reports on general aviation, 1975 to 1981
[NASA-TM-83307] N82-19132
BILLETS
Lucas stretched acrylic
A82-24318
BIRD-AIRCRAFT COLLISIONS
Transparencies - What an aircraft designer should know
A82-24305
An analytical methodology to predict potential aircraft losses due to canopy birdstrikes
A82-24313

GROUND SUPPORT EQUIPMENT
  Analysis of Built-In-Test (BIT) false alarm conditions [AD-A108752] N82-18217
  Further development of the test concept of the ALPHA JET engine LARZAC 04 N82-18223
GROUND TESTS
  SH-608 test program N82-18141
  Electrical ground testing of aircraft antistatic protection N82-19156
GROUND WIND
  Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts [MBB-FE-172/S/PUB/39-PT-1] N82-19228
GUST ALLEVIATORS
  A method for applying linear optimal control theory to the design of a regulator for a flexible aircraft --- improving riding quality in fighter aircraft [NLR-TR-80032-U] N82-19212
GYROSCOPIC STABILITY
  Stability of a three-stage dynamic stand A82-25353
GYROSTABILIZERS
  A method for the investigation of gyrostabilization systems A82-24892

H

HARMONIC MOTION
  A simplified method for predicting rotor blade airloads N82-18124
HARNESSES
  Disengagement of safety harness buckles - CT4 [AD-A109048] N82-19199
HEAD-UP DISPLAYS
  A new angular deviation measurement device for aircraft transparencies A82-24308
HEAT PUMPS
  Open-cycle vapor compression heat pump [PB82-110503] N82-18553
HEAT RESISTANT ALLOYS
  Where is cobalt irreplaceable A82-25538
HEAT TRANSFER
  Engine superficial temperature and infrared signature N82-18136
HEAT TREATMENT
  Aluminum and its alloys - Weldability A82-23755
  A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum A82-23772
HELICOPTER CONTROL
  A control model for maneuvering flight for application to a computer-flight testing program N82-18153
  A redundancy concept for a digital CSAS N82-18170
  The influence of sensor and actuator characteristics on overall helicopter AFCS design N82-18171
HELICOPTER DESIGN
  LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System [SAE PAPER 811080] A82-24412
  Standardization of helicopter fatigue methodology - A manufacturer's view A82-24704
  Evolution of the Aeroscout A82-24706
  Flight condition recognition /FCR/ technique --- microprocessor-based recording for helicopter structural component fatigue damage A82-24712
  Fatigue test of the typical main rotor controls component A82-24715
  Helicopter rotor load prediction A82-24719
  A study of the techniques of dynamic analysis of helicopter type structures N82-18129
  The effects of slight non-linearities on modal testing of helicopter-like structures N82-18130
  Point of view of a helicopter manufacturer on airworthiness regulations N82-18137
  Military requirements: Too little or too much N82-18138
  Parametric criteria and impact on design trends N82-18139
  Design philosophy of the Hughes model 600 helicopter N82-18140
  SH-608 test program N82-18141
  Naval versions of the Dauphin and the AS 15 TT weapon system N82-18142
  Army Lynx: Product development matched to military combat development N82-18143
  A light helicopter for night firing N82-18144
  Flight characteristics design and development of the MBB/KHI BK117 helicopter N82-18150
  The role of simulation in the design process N82-18154
  Impact of systems technology and integration on helicopter design N82-18165
  The multi mode matrix flat panel display: Technology and applications N82-18169
  Integration of inertial sensors in helicopters N82-18173
  NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary [NASA-TM-84149] N82-19170
  NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views [NASA-TM-84148] N82-19171
  NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors [NASA-TM-84146] N82-19173
  Experience during the development of the German-Japanese helicopter BK 117 [MBB-UD-318-81-O] N82-19210
  Design study into a high endurance mini-rotorcraft [BU-265] N82-19216
HELICOPTER ENGINES
  Parametric study of the influence of the engine upon the operating cost of a civil helicopter N82-18131
  Measurement techniques used to assess the installed power of a helicopter engine N82-18133
  Component design and development for future helicopter engines N82-18134
  Three-engine control system for the prototype EH-101 helicopter [AEBG-9/81-1568L] N82-18135
  NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary [NASA-TM-84149] N82-19170
  NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views [NASA-TM-84148] N82-19171
  NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors [NASA-TM-84146] N82-19173
HELICOPTER PERFORMANCE
  Utilizing the helicopter's versatility to improve the ATC system A82-23316
  The Agusta's solution of AHS's hypothetical fatigue life problem A82-24701
  Hughes helicopters - Fatigue life methodology A82-24710

Fundamentals of helicopter fatigue life determination A82-24714
Hypothetical fatigue life problem - Application of Aerospatiale method A82-24716
The cargo helicopter - A logistical vehicle A82-24717
An analytical investigation of the free-tip rotor for helicopters [NASA-TM-81345] N82-18179
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary [NASA-TM-84149] N82-19170
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views [NASA-TM-84148] N82-19171
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors [NASA-TM-84146] N82-19173

HELICOPTER PROPELLER DRIVE
Application of fatigue, crack propagation and strain survey testing to the CH-46 aft rotor drive shaft A82-24705

HELICOPTER TAIL ROTORS
Wind tunnel investigation of high speed rotor noise N82-18146

HELICOPTER WAKES
Seventh European Rotorcraft and Powered Lift Aircraft Forum N82-18119
A simplified approach to the free wake analysis of a hovering rotor N82-18121
An experimental analysis of the shape of a rotor wake N82-18122
Optimum performance and wake geometry of co-axial rotor in hover N82-18156
A numerical approach to co-axial rotor aerodynamics N82-18157

HELICOPTERS
The challenge of standardizing fatigue methodology A82-24703
A method of determining safe service life for helicopter components A82-24709
Boeing Vertol fatigue life methodology A82-24718
The effects of slight non-linearities on modal testing of helicopter-like structures N82-18130
Preliminary thoughts on helicopter cabin noise prediction methods N82-18148
The measurement of the mobility of structures at acoustic frequencies N82-18149
Separated flow around helicopter bodies N82-18163
Mast mounted visual aids N82-18167
Experimental investigation of visual aids for helicopters: Low level flight at night and poor visibility N82-18168
Evaluation of the helicopter low airspeed system LASSIE N82-18172
An analytical investigation of the free-tip rotor for helicopters [NASA-TM-81345] N82-18179
On the calculation of separated flow on helicopter fuselages [MBB-UD-321-81-O] N82-18188
A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors [RAE-TM-RAD-NAV-145] N82-18503
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary [NASA-TM-84149] N82-19170
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views [NASA-TM-84148] N82-19171
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 3: Aerodynamics and Structures Session [NASA-TM-84147] N82-19172
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors [NASA-TM-84146] N82-19173
Structural system identification technology verification [AD-A109181] N82-19583
Effects of repetition rate and impulsiveness of simulated helicopter rotor noise on annoyance [NASA-TP-1969] N82-19707
Noise measurements on the helicopter BK 117 design. Weighted noise levels and influence of airspeed [DFVLR-MITT-81-18] N82-19957

HELMET MOUNTED DISPLAYS
Experimental investigation of visual aids for helicopters: Low level flight at night and poor visibility N82-18168
Equipment for testing and measuring a "helmet mounted sight and display" system with a coupled movable TV camera in the flight simulator for research of the DFVLR [ESA-TT-675] N82-19219

HIGH FREQUENCIES
The testing of aircraft under near field conditions A82-24361

HIGH SPEED
High speed VSCF generator design consideration --- computer aided design for Variable Speed Constant Frequency generator A82-24379

HIGH STRENGTH
The development of high strength light-weight windshields for the new generation of Boeing 757 and 767 airliners A82-24323

HIGH TEMPERATURE
High temperature engine control electronics [SAE PAPER 811074] A82-24407

HIGH VOLTAGES
Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States A82-24382

HISTORIES
History of the sweptback wing [DGLR PAPER 81-070] A82-22898
NASA pocket statistics [NASA-TM-84134] N82-19084

HOLE GEOMETRY (MECHANICS)
A compilation of stress intensity factor solutions for flawed fastener holes [AD-A108753] N82-18620

HONEYCOMB STRUCTURES
Metal honeycomb to porous wireform substrate diffusion bond evaluation [NASA-TM-82793] N82-18612

HOT-WIRE FLOWMETERS
An experimental analysis of the shape of a rotor wake N82-18122

HOVERING
A simplified approach to the free wake analysis of a hovering rotor N82-18121
Optimum performance and wake geometry of co-axial rotor in hover N82-18156
A numerical approach to co-axial rotor aerodynamics N82-18157
A method of predicting fuselage loads in hover N82-18164

HOVERING STABILITY
Hover tests of a model H-force rotor N82-18159

HUGHES AIRCRAFT
Hughes helicopters - Fatigue life methodology A82-24710

HUMAN FACTORS ENGINEERING
Combined multisensor displays --- image preprocessing for shape coding to reduce pilot workload A82-22905

The role of finite element analysis in the design of birdstrike resistant transparencies
A82-24314
Aircraft transparency bird impact analysis using the MAGNA computer program
A82-24315
The effects of bird orientation on load profile and damage level
A82-24316

BLADE TIPS
Prediction of blade vortex interaction noise from measured blade pressure
N82-18147
The problem of calculation of the flow around helicopter rotor blade tips
N82-18160
An analytical investigation of the free-tip rotor for helicopters
[NASA-TM-81345] N82-18179
On the calculation of transonic blade tip flow for helicopter rotors
[MBB-UD-320-81-O] N82-18187

BLOWDOWN WIND TUNNELS
Induction driven transonic wind tunnel T2: Operation at room temperature and cryogenic adaptation
N82-19158

BODY-WING CONFIGURATIONS
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
[NASA-CR-165852] N82-19167

BOEING 727 AIRCRAFT
Restoration of performance, Models 727, 737, and 747
[SAE PAPER 811072] A82-24406

BOEING 737 AIRCRAFT
Boeing's big, quiet 737-300
A82-23369
Restoration of performance, Models 727, 737, and 747
[SAE PAPER 811072] A82-24406

BOEING 747 AIRCRAFT
Restoration of performance, Models 727, 737, and 747
[SAE PAPER 811072] A82-24406

BOEING 757 AIRCRAFT
The development of high strength light-weight windshields for the new generation of Boeing 757 and 767 airliners
A82-24323

BOLTS
D.C.9 windshield - Effect of attachment retorque
A82-24324

BOMBS (ORDNANCE)
Bomb crater repair techniques for permanent airfields. Report 1: Series 1 tests
[AD-A108716] N82-18229

BOUNDARY LAYER CONTROL
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test
[AIAA 82-0568] A82-24656

BOUNDARY LAYER SEPARATION
Investigations of the separation behavior on airfoils at high angles of attack, using linear lift theory
[MBB-FE-122/S/PUB/37] N82-18189

BRAKING
Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility
[NASA-TP-1959] N82-18204

BROADCASTING
FM broadcast interference related to airborne ILS, VOR and VHF communications
[RTCA/DO-176] N82-19419
Investigation of technical requirements
N82-19420

C

C-160 AIRCRAFT
Importance of a tactical cargo aircraft in emergency relief
A82-25499

CABIN ATMOSPHERES
Environmental Control Systems
N82-19141

CALIBRATING
Pressure transducer calibration process
[SAE PAPER 811076] A82-24408

CANOPIES
Aircraft transparency design guide
A82-24307
Windshield system structural enhancement
A82-24312
An analytical methodology to predict potential aircraft losses due to canopy birdstrikes
A82-24313
Aircraft transparency bird impact analysis using the MAGNA computer program
A82-24315

CAPACITANCE
Assessment of aircraft capacitive circuit medium wave antennas according to their efficiency
N82-19453

CARBON FIBER REINFORCED PLASTICS
Characterization of the Airbus horizontal stabilizers of CFRP construction and structural analysis with the finite element method
[MBB-UT-13-81-O] N82-18213

CARBON FIBERS
Carbon-fiber composites - A fiber composite material for highly stressed light-construction components
A82-24805

CARGO AIRCRAFT
The cargo helicopter - A logistical vehicle
A82-24717

CATAPULTS
Investigation of crossdeck pendant catapult slot interaction; proposed corrective measures
[AD-A108149] N82-18232

CATHODE RAY TUBES
Reducing reflections on the front surface of air traffic control displays
A82-23314
Electronic flight instrument systems /EFIS/, the instrumentation of the 1980s
A82-25324

CEMENTS
Investigation into the utility of some quick setting cements for runway repair
[B-80-157/60.7.0157] N82-18225

CENTER OF GRAVITY
Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning
A82-23470
A study of flight control requirements for advanced, winged, earth-to-orbit vehicles with far-aft center-of-gravity locations
[NASA-CR-3491] N82-19226

CERAMIC COATINGS
Novel metal-ceramics-composite sealing coatings in aircraft engines
A82-24803

CERMETS
Novel metal-ceramics-composite sealing coatings in aircraft engines
A82-24803

CERTIFICATION
Application of damage tolerance technology to type certification
[SAE PAPER 811062] A82-24388
Certification of civil composite aircraft structure
[SAE PAPER 811061] A82-24389
Collection and evaluation of propeller aircraft noise certification data
[DFVLR-MITT-81-20] N82-19958

CH-46 HELICOPTER
Application of fatigue, crack propagation and strain survey testing to the CH-46 aft rotor drive shaft
A82-24705

CHARGE COUPLED DEVICES
A new angular deviation measurement device for aircraft transparencies
A82-24308

CIVIL AVIATION
International plans for civil and military co-ordination
A82-23317
Air transportation of handicapped persons
A82-24338
Airline flight planning - The weather connection
[SAE PAPER 811067] A82-24386
Certification of civil composite aircraft structure
[SAE PAPER 811061] A82-24389

The application of NAVSTAR differential GPS in the civilian community
A82-24645
Analysis of loran-C system reliability for civil aviation
A82-24650
The toll of ILS-preventable aviation accidents
A82-25325
Impact of technology on avionics cost trends
[AD-A108494] N82-18219
Trends in airline avionics
[NLR-MP-80013-U] N82-18220
Bibliography of NASA published reports on general aviation, 1975 to 1981
[NASA-TM-83307] N82-19132
FAA statistical handbook of aviation
[AD-A109289] N82-19198

CLEAR AIR TURBULENCE
Development of a clear air radar to detect meteorological hazards at airports
[AD-A108236] N82-18835

CLOCKS
Global positioning system timing receivers in the DSN
N82-20126

COASTS
United States Coast Pilot 9. Pacific and Arctic Coasts Alaska: Cape Spencer to Beaufort Sea
[PB82-109562] N82-18201

COBALT
Where is cobalt irreplaceable
A82-25538

COCKPIT SIMULATORS
The role of simulation in the design process
N82-18154

COCKPITS
F/A-18 weapon system development
A82-23774
Deficiencies and constraints that affect the design of cockpit enclosures and transparencies
A82-24303
B.A.C. One-Eleven flight deck glazing product improvement
A82-24325
Integration of energy management concepts into the flight deck
[SAE PAPER 811066] A82-24387
The multi mode matrix flat panel display: Technology and applications
N82-18169
New developments in cockpit-human interfaces
[RAE-TM-FS-412] N82-18215
Analytical study of cockpit information requirements
[AD-A108524] N82-18218
Transport aircraft cockpit standardization (Federal Aviation regulations part 25)
[AD-A108924] N82-19207

COLLISION AVOIDANCE
Discrete Address Beacon System /DABS/
A82-23322
Conflicts between random flights in a given area
A82-25213
Midair and near midair collisions on two- and three-dimensional curvilinear flight paths
[ESA-TT-685] N82-18200
Aircraft collision avoidance systems
[GPO-79-431] N82-19201

COMBAT
Evolution of the Aeroscout
A82-24706
The cargo helicopter - A logistical vehicle
A82-24717

COMBUSTION CHAMBERS
Fuel-rich plume combustion
[AD-A108136] N82-18349
Dilution jet behavior in the turn section of a reverse flow combuster
[NASA-TM-82776] N82-19220

COMMAND AND CONTROL
A redundancy concept for a digital CSAS
N82-18170

COMMERCIAL AIRCRAFT
Airworthiness considerations in the design of commercial transport aircraft
[SAE PAPER 811039] A82-24396
Electronic flight instrument systems /EFIS/, the instrumentation of the 1980s
A82-25324
Naval versions of the Dauphin and the AS 15 TT weapon system
N82-18142
Impact of technology on avionics cost trends
[AD-A108494] N82-18219
Bibliography of NASA published reports on general aviation, 1975 to 1981
[NASA-TM-83307] N82-19132
FAA statistical handbook of aviation
[AD-A109289] N82-19198
Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane
[NASA-TP-1966] N82-19225

COMMUNICATION EQUIPMENT
Selection of telecommunication equipment - A new approach to the equivalent cost concept
A82-25510

COMMUNICATION NETWORKS
Beyond the horizon coverage for air navigation/traffic control
A82-24647
Selection of telecommunication equipment - A new approach to the equivalent cost concept
A82-25510
National Airspace Data Interchange Network (NADIN) support of Remote Maintenance Monitoring System (RMMS)
[AD-A109125] N82-19160

COMMUNITIES
Direct comparison of community response to road traffic noise and to aircraft noise
A82-22974

COMPACTING
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230

COMPATIBILITY
Aircraft/airport compatibility - A constant challenge for aircraft designers
A82-25119

COMPONENT RELIABILITY
Material/structure degradation due to fretting and fretting-initiated fatigue
A82-23771
The inter-relation between design, construction and maintenance
A82-24010
Standardization of helicopter fatigue methodology - A manufacturer's view
A82-24704
A method of determining safe service life for helicopter components
A82-24709
Advanced attack helicopter fatigue testing - Overview
A82-24720

COMPOSITE STRUCTURES
Structural testing of composites with known defects
A82-24708
NDE of composite rotor blades during fatigue testing
A82-24713

COMPRESSOR BLADES
Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82
[NASA-TP-1974] N82-19222

COMPRESSOR ROTORS
Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82
[NASA-TP-1974] N82-19222

COMPRESSORS
Open-cycle vapor compression heat pump
[PB82-110503] N82-18553
Foundations for computer simulation of a low pressure oil flooded single screw air compressor
[AD-A108230] N82-19391

COMPUTATION
A complete method for computation of blade mode characteristics and responses in forward flight
N82-18126

COMPUTATIONAL FLUID DYNAMICS
Design of supercritical swept wings
A82-23826
Annual review of fluid mechanics. Volume 14 --- Book
A82-24416

Point of view of a helicopter manufacturer on airworthiness regulations N82-18137

Multiple ejection effects analysis [AD-A108277] N82-18192

HUMAN PERFORMANCE

Analysis of system problems using aviation safety reporting system data A82-23312

HUMAN REACTIONS

Direct comparison of community response to road traffic noise and to aircraft noise A82-22974

HUMIDITY MEASUREMENT

Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data A82-25113

HYDRAULIC CONTROL

On-line control for the regulation of power source in multiple-servo electro-hydraulic systems [ASME PAPER 81-WA/DSC-3] A82-24562

Describing function analysis of nonlinear nose gear shimmy [ASME PAPER 81-WA/DSC-20] A82-24565

HYPERSONIC FLOW

Oscillating supersonic/hypersonic wings at high incidence A82-23828

HYPERSONIC WIND TUNNELS

Technical innovations in testing and analysis of heat and pressure models in hypersonic wind tunnels [AIAA 82-0578] A82-24660

HYPOTHESES

A complete method for computation of blade mode characteristics and responses in forward flight N82-18126

I

ICE FORMATION

Helicopter Icing Spray System (HISS) nozzle improvement evaluation [AD-A109405] N82-19208

IMAGE PROCESSING

Combined multisensor displays --- image preprocessing for shape coding to reduce pilot workload A82-22905

IMAGING TECHNIQUES

Computer-generated images for simulators - The cost of technology A82-22881

IMPACT DAMAGE

The effects of bird orientation on load profile and damage level A82-24316

IMPACT PREDICTION

An analytical methodology to predict potential aircraft losses due to canopy birdstrikes A82-24313

IMPACT RESISTANCE

The role of finite element analysis in the design of birdstrike resistant transparencies A82-24314

IMPEDANCE MEASUREMENT

Antenna (selected articles) [AD-A108174] N82-19448

IN-FLIGHT MONITORING

Propulsion multiplexer /PMUX/ system - The missing link [SAE PAPER 811078] A82-24411

Flight test data acquisition and interpretation A82-24707

Flight condition recognition /FCR/ technique --- microprocessor-based recording for helicopter structural component fatigue damage A82-24712

INDUSTRIES

Experience during the development of the German-Japanese helicopter BK 117 [MBB-UD-318-81-0] N82-19210

INERTIAL PLATFORMS

Integration of inertial sensors in helicopters N82-18173

Software features applicable to inertial measurement unit self alignment [AD-A108511] N82-18196

INFORMATION DISSEMINATION

Experience during the development of the German-Japanese helicopter BK 117 [MBB-UD-318-81-0] N82-19210

INFORMATION FLOW

Integration of complex systems in current and future aircraft projects for the example of avionics [MBB-UH-18-80-0] N82-18221

INFORMATION MANAGEMENT

Integration of complex systems in current and future aircraft projects for the example of avionics [MBB-UH-18-80-0] N82-18221

INFORMATION SYSTEMS

The use of dynamic mock-ups in the design of advanced systems --- USAF's Digital Avionic Information System and NAVY's Advanced Integrated Display System A82-22902

Analytical study of cockpit information requirements [AD-A108524] N82-18218

INFRARED RADIATION

Engine superficial temperature and infrared signature N82-18136

INLET FLOW

An ejector augmented choking valve for the metering and control of inlet and bleed duct flows [AIAA 82-0575] A82-24659

An experimental study of the effects of an inlet flow conditioner on the noise of a low speed axial flow fan --- in an aircraft engine [TT-8101] N82-19956

INSPECTION

MSG-3 structures --- inspection program for aircraft maintenance A82-24011

MSG-3 overview --- aircraft maintenance program development A82-24014

Analysis of Built-In-Test (BIT) false alarm conditions [AD-A108752] N82-18217

INSTRUCTORS

Task analytic techniques: Application to the design of a flight simulator instructor/operator console [AD-A108724] N82-18227

INSTRUMENT APPROACH

The requirements for reduced IFR separations on final approach A82-23311

A Microwave Landing System simulation A82-23323

INSTRUMENT FLIGHT RULES

The requirements for reduced IFR separations on final approach A82-23311

Utilizing the helicopter's versatility to improve the ATC system A82-23316

INSTRUMENT LANDING SYSTEMS

GTD terrain reflection model applied to ILS glide scope --- Geometrical Theory of Diffraction A82-23027

The toll of ILS-preventable aviation accidents A82-25325

Descent-rate cuing for carrier landings: Effects of display gain, display noise and aircraft type [AD-A108801] N82-19206

FM broadcast interference related to airborne ILS, VOR and VHF communications [RTCA/DO-176] N82-19419

Investigation of technical requirements N82-19420

Investigation of airborne VHF communication and navigation equipment N82-19421

INTAKE SYSTEMS

Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82 [NASA-TP-1974] N82-19222

INTERACTIVE CONTROL

CAD/CAM in British Aerospace - Aircraft Group A82-24373

INTERFACES
New developments in cockpit-human interfaces
[RAE-TM-FS-412] N82-18215
INTERMODULATION
Investigation of the effects of airborne installation factors on receiver interference
N82-19422
INTERNATIONAL COOPERATION
Airworthiness regulation: What is our strategy - What are the issues
A82-24006
What the operator wants --- airline cooperation in aircraft maintenance
A82-24008
Experience during the development of the German-Japanese helicopter BK 117
[MBB-UD-318-81-O] N82-19210
INTERPRETATION
Flight test data acquisition and interpretation
A82-24707
INTERPROCESSOR COMMUNICATION
Distributed intelligence for air fleet control
[AD-A108611] N82-18195
An on board supervisory system for applications in space missions
[INPE-2097-RPE/327] N82-18216

J

JET AIRCRAFT
Transparencies - What an aircraft designer should know
A82-24305
Further development of the test concept of the ALPHA JET engine LARZAC 04
N82-18223
JET AIRCRAFT NOISE
Effect of facility variation on the acoustic characteristics of three single stream nozzles
[NASA-TM-81635] N82-19944
Acoustic measurements of F100-PW-100 engine operating in hush house NSN 4920-02-070-2721
[AD-A108814] N82-19952
JET CONTROL
Potential reductions in aircraft operation and maintenance costs by using thrust computing support equipment
[AD-A108463] N82-18207
JET ENGINE FUELS
Improving the accuracy of the estimates of surfactant content in jet fuels
A82-23250
Low grade fuels for turbo and jet engines
A82-23439
Airline fuel saving through JT9D engine refurbishment
[SAE PAPER 811051] A82-24395
An assessment of the crash fire hazard of liquid hydrogen fueled aircraft
[NASA-CR-165526] N82-19196
JET ENGINES
Low grade fuels for turbo and jet engines
A82-23439
Air cooled engine test facilities
A82-24004
Airline fuel saving through JT9D engine refurbishment
[SAE PAPER 811051] A82-24395
Acoustic measurements of F100-PW-100 engine operating in hush house NSN 4920-02-070-2721
[AD-A108814] N82-19952
JET FLOW
Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet
[ASME PAPER 81-WA/FE-3] A82-24566
Dilution jet behavior in the turn section of a reverse flow combuster
[NASA-TM-82776] N82-19220
JET PROPULSION
Further development of the test concept of the ALPHA JET engine LARZAC 04
N82-18223
JOINTS (JUNCTIONS)
Practical applications of fracture mechanics
[AGARD-AG-257] N82-19571

K

KALMAN FILTERS
Fixed gain controller design for aircraft
A82-23441
Extension of proportional navigation by the use of optimal filtering and control methods
[ESA-TT-683] N82-18199
KAPTON (TRADEMARK)
The use of 'Kapton' polyimide film in aerospace applications
[SAE PAPER 811091] A82-24413
KEVLAR (TRADEMARK)
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding
[AD-A109377] N82-19209

L

LAGRANGE COORDINATES
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127
LAMINAR BOUNDARY LAYER
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test
[AIAA 82-0568] A82-24656
LAMINAR FLOW AIRFOILS
Laminar airfoils for transport aircraft
[ESA-TT-680] N82-18190
LANDING AIDS
The birth of precision DME
A82-24066
Development of a clear air radar to detect meteorological hazards at airports
[AD-A108236] N82-18835
LANDING GEAR
Describing function analysis of nonlinear nose gear shimmy
[ASME PAPER 81-WA/DSC-20] A82-24565
Oscillations and vibrations of aircraft on runways
A82-24974
LANDMARKS
United States Coast Pilot 9. Pacific and Arctic Coasts Alaska: Cape Spencer to Beaufort Sea
[PB82-109562] N82-18201
LASER RANGER/TRACKER
Wide field of view laser beacon system for three-dimensional aircraft position measurement
[ASME PAPER 81-WA/DSC-9] A82-24563
LEAD ACID BATTERIES
Vehicle test report: Battronic pickup truck
[NASA-CR-168637] N82-19205
LEADING EDGES
History of the sweptback wing
[DGLR PAPER 81-070] A82-22898
LEGAL LIABILITY
Air transportation of handicapped persons
A82-24338
LIFE CYCLE COSTS
Cost of ownership advantages with a shared oil system
A82-24378
LIFT
A three-dimensional approach to lift and moment coefficients of rotating blades
N82-18125
Slotted variable camber flap
[NASA-CASE-LAR-12541-1] N82-18203
Theoretical investigations on the influence of different strake, tail unit, and conventional HLW arrangement as well as of CCV on the aerodynamic characteristics of fighter aircraft configurations
[MBB-FE-122/S/PUB/36] N82-18211
LIFT AUGMENTATION
XFV-12A diagnostic and development programs
[AD-A108354] N82-18206
LIFT FANS
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

LIFTING ROTORS
A further study of helicopter rotor pitch-flap-phase coupling
[BU-259] N82-19214

LIGHT AIRBORNE MULTIPURPOSE SYSTEM
LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System
[SAE PAPER 811080] A82-24412

LIGHT AIRCRAFT
Complete guide to Rutan homebuilt aircraft --- Book
A82-22880

The reliability and safety of small passenger aircraft
A82-24972

LIGHT EMITTING DIODES
The multi mode matrix flat panel display: Technology and applications
N82-18169

LIQUID HYDROGEN
An assessment of the crash fire hazard of liquid hydrogen fueled aircraft
[NASA-CR-165526] N82-19196

LIQUIDS
A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials
[NASA-CR-165763] N82-18327

LOAD TESTS
The effects of bird orientation on load profile and damage level
A82-24316

Operating flight loads and their effect on engine performance
[SAE PAPER 811071] A82-24405
Fundamentals of helicopter fatigue life determination
A82-24714

LOADING MOMENTS
Some unsteady aerodynamic effects on helicopter rotors
N82-18162

LOGIC DESIGN
The influence of sensor and actuator characteristics on overall helicopter AFCS design
N82-18171

LONG TERM EFFECTS
Design technology for improved performance retention in turbofan engines
[SAE PAPER 811055] A82-24392

LONGITUDINAL CONTROL
Preliminary investigation into the addition of auxiliary longitudinal thrust on helicopter agility
N82-18155

LOOP ANTENNAS
Calculation and measurement of electric field strength for airborne antennas in the LF/MF range
A82-25011

LORAN
Institute of Navigation, Annual Meeting, 37th, U.S. Naval Academy, Annapolis, MD, June 9-11, 1981, Proceedings
A82-24643

Loran for precise position location - The VIEW-NAV system
A82-24648

LORAN C
Loran-C RNAV in mountainous areas
A82-24649

Analysis of loran-C system reliability for civil aviation
A82-24650

LOW ASPECT RATIO
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[AIAA PAPER 80-0724] A82-24022

LOW COST
Welding for low-cost advanced titanium airframe structures
A82-23757

LUBRICATING OILS
Monitoring engine wear by oil analysis
A82-24012

Cost of ownership advantages with a shared oil system
A82-24378

M

MACH NUMBER
History of the sweptback wing
[DGLR PAPER 81-070] A82-22898

MAGNETIC FIELDS
TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km
[AD-A108182] N82-18464

MAINTAINABILITY
Integrated control design techniques
[AD-A108223] N82-18224
Assessment of Avionic Equipment Field Reliability and Maintainability as Functions of Unit Cost
[AD-A109373] N82-19218

MAINTENANCE
Investigation into the utility of some quick setting cements for runway repair
[B-80-157/60.7.0157] N82-18225
Bomb crater repair techniques for permanent airfields. Report 1: Series 1 tests
[AD-A108716] N82-18229

MAN MACHINE SYSTEMS
Analysis and optimization of control systems in piloted flight vehicles --- Russian book
A82-22398

New developments in cockpit-human interfaces
[RAE-TM-FS-412] N82-18215

MANAGEMENT INFORMATION SYSTEMS
National Airspace Data Interchange Network (NADIN) support of Remote Maintenance Monitoring System (RMMS)
[AD-A109125] N82-19160

MANEUVERABILITY
A control model for maneuvering flight for application to a computer-flight testing program
N82-18153

Preliminary investigation into the addition of auxiliary longitudinal thrust on helicopter agility
N82-18155

MANUFACTURING
CAD/CAM in British Aerospace - Aircraft Group
A82-24373

Point of view of a helicopter manufacturer on airworthiness regulations
N82-18137

MARINE ENVIRONMENTS
LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System
[SAE PAPER 811080] A82-24412

MARINE TRANSPORTATION
A marine NAVSTAR GPS receiver
A82-24644

MARKET RESEARCH
Where is cobalt irreplaceable
A82-25538

MASS
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127

MATERIAL ABSORPTION
The effects of absorbed moisture upon the physical properties of stretched acrylic materials
A82-24320

MATHEMATICAL MODELS
Sensitivity reduction by double perfect model following --- with application to aircraft control
A82-23029

An analytical methodology to predict potential aircraft losses due to canopy birdstrikes
A82-24313

Parametric criteria and impact on design trends
N82-18139

Volumetric pattern prediction of antennas on aircraft using the geometrical theory of diffraction
[ESA-TT-677] N82-18483
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
[NASA-CR-165852] N82-19167
Workshop on Mathematical Fire Modeling
[AD-A108876] N82-19343

Aircraft noise prediction program theoretical manual, part 1
[NASA-TM-83199-PT-1] N82-19946
Aircraft noise prediction program theoretical manual, part 2
[NASA-TM-83199-PT-2] N82-19947

MEASURING INSTRUMENTS
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels
[AIAA 82-0603] A82-24675

MECHANICAL ENGINEERING
Lineup of the LM-series aircraft-derivative gas turbines
A82-22896
Design technology for improved performance retention in turbofan engines
[SAE PAPER 811055] A82-24392

MECHANICAL PROPERTIES
Carbon-fiber composites - A fiber composite material for highly stressed light-construction components
A82-24805

MEDICAL SERVICES
Importance of a tactical cargo aircraft in emergency relief
A82-25499

METAL COATINGS
Electroforming of space and aircraft structures
[MBB-BB-491-O] N82-18419

METAL FILMS
High-frequency monitoring of surface layers of metals
A82-23603

METAL FOILS
Metal honeycomb to porous wireform substrate diffusion bond evaluation
[NASA-TM-82793] N82-18612

METAL PARTICLES
Monitoring engine wear by oil analysis
A82-24012

METEOROLOGICAL PARAMETERS
Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data
A82-25113

METEOROLOGICAL RADAR
Scanning strategies for air traffic control radars
A82-24646
Development of a clear air radar to detect meteorological hazards at airports
[AD-A108236] N82-18835

METEOROLOGICAL SERVICES
Wind and temperature database for flight planning
[SAE PAPER 811068] A82-24385
Airline flight planning - The weather connection
[SAE PAPER 811067] A82-24386

MICROCRACKS
High-frequency monitoring of surface layers of metals
A82-23603

MICROPROCESSORS
Lightweight ATC systems
A82-23321
Packaging the VSCF system for an aircraft engine environment
A82-24383

MICROWAVE LANDING SYSTEMS
A Microwave Landing System simulation
A82-23323

MIDAIR COLLISIONS
Midair and near midair collisions on two- and three-dimensional curvilinear flight paths
[ESA-TT-685] N82-18200
Aircraft collision avoidance systems
[GPO-79-431] N82-19201

MILITARY AIR FACILITIES
International plans for civil and military co-ordination
A82-23317

MILITARY AIRCRAFT
Fixed gain controller design for aircraft
A82-23441
Transparency development needs for military aircraft in the 1980's
A82-24302
Aircraft transparency bird impact analysis using the MAGNA computer program
A82-24315
EMC clearance of modern military aircraft
A82-24359
Naval versions of the Dauphin and the AS 15 TT weapon system
N82-18142
Army Lynx: Product development matched to military combat development
N82-18143
A light helicopter for night firing
N82-18144

MILITARY HELICOPTERS
The way ahead for helicopter maintenance
A82-24009
Structural testing of composites with known defects
A82-24708
The cargo helicopter - A logistical vehicle
A82-24717
Preliminary investigation into the addition of auxiliary longitudinal thrust on helicopter agility
N82-18155
Review of helicopter Mast Mounted Sight (MMS) base motion isolation and Line-of-Sight (LOS) stabilization concepts
N82-18166
Vibration levels in Army helicopters: Measurement recommendations and data
[AD-A108131] N82-18209

MILITARY OPERATIONS
Military requirements: Too little or too much
N82-18138
Naval versions of the Dauphin and the AS 15 TT weapon system
N82-18142
Army Lynx: Product development matched to military combat development
N82-18143

MILITARY TECHNOLOGY
YF-16 design concept and philosophy
A82-23444
Quality, quantity, and technology - A perspective on fighter development
[SAE PAPER 811097] A82-24400
Future strike fighter options - Concepts and technologies
[SAE PAPER 811099] A82-24403
Technology for quality and quantity in a new fighter
[SAE PAPER 811100] A82-24404
Evolution of the Aeroscout
A82-24706
Military requirements: Too little or too much
N82-18138
Tethered rotorplatforms and their mission potential
N82-18145

MISSILE CONTROL
Extension of proportional navigation by the use of optimal filtering and control methods
[ESA-TT-683] N82-18199

MISSILE DEFENSE
Perspectives for Controlled Weapons Technology: Report of the 90th Helicopter Forum
[MBB-UA-532-80-O] N82-19211

MISSILE SYSTEMS
Perspectives for Controlled Weapons Technology: Report of the 90th Helicopter Forum
[MBB-UA-532-80-O] N82-19211

MISSION PLANNING
LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System
[SAE PAPER 811080] A82-24412

MODAL RESPONSE
The effects of slight non-linearities on modal testing of helicopter-like structures
N82-18130

MOISTURE CONTENT
Improving the accuracy of the estimates of surfactant content in jet fuels
A82-23250
The effects of absorbed moisture upon the physical properties of stretched acrylic materials
A82-24320

MOMENTS
A three-dimensional approach to lift and moment coefficients of rotating blades
N82-18125

MOMENTUM THEORY
An extension of the local momentum theory to the rotors operating in twisted flow field
N82-18123

MONOCHROMATORS
Engine superficial temperature and infrared signature
N82-18136

MOTION STABILITY
Describing function analysis of nonlinear nose gear shimmy
[ASME PAPER 81-WA/DSC-20] A82-24565

MOUNTAINS
Loran-C RNAV in mountainous areas
A82-24649

MULTIPLEXING
Propulsion multiplexer /PMUX/ system - The missing link
[SAE PAPER 811078] A82-24411

MX MISSILE
Technical innovations in testing and analysis of heat and pressure models in hypersonic wind tunnels
[AIAA 82-0578] A82-24660

N

NACELLES
RB 211 powerplant deterioration - Review of current situation and lessons learned
[SAE PAPER 811053] A82-24393

NASA PROGRAMS
Integration of energy management concepts into the flight deck
[SAE PAPER 811066] A82-24387
NASA pocket statistics
[NASA-TM-84134] N82-19084

NATIONAL AIRSPACE UTILIZATION SYSTEM
Stereographic projection in the National Airspace System
A82-23031

NAVIGATION
Integrated control design techniques
[AD-A108223] N82-18224

NAVIGATION AIDS
Navigational aids on-board the Concorde
A82-24065
United States Coast Pilot 9. Pacific and Arctic Coasts Alaska: Cape Spencer to Beaufort Sea
[PB82-109562] N82-18201

NAVIGATION INSTRUMENTS
A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors
[RAE-TM-RAD-NAV-145] N82-18503

NAVSTAR SATELLITES
Institute of Navigation, Annual Meeting, 37th, U.S. Naval Academy, Annapolis, MD, June 9-11, 1981, Proceedings
A82-24643
A marine NAVSTAR GPS receiver
A82-24644
The application of NAVSTAR differential GPS in the civilian community
A82-24645

NEAR FIELDS
The testing of aircraft under near field conditions
A82-24361

NETWORK SYNTHESIS
A marine NAVSTAR GPS receiver
A82-24644

NICKEL CADMIUM BATTERIES
Recent improvements in aircraft Ni-Cd cells
A82-24245

NIGHT FLIGHTS (AIRCRAFT)
A light helicopter for night firing
N82-18144
Experimental investigation of visual aids for helicopters: Low level flight at night and poor visibility
N82-18168

NOISE INTENSITY
Preliminary thoughts on helicopter cabin noise prediction methods
N82-18148

NOISE MEASUREMENT
Mean flow and noise measurements in a Mach 3.5 pilot quiet tunnel
[AIAA 82-0569] A82-24657
Effect of facility variation on the acoustic characteristics of three single stream nozzles
[NASA-TM-81635] N82-19944

NOISE POLLUTION
Direct comparison of community response to road traffic noise and to aircraft noise
A82-22974

NOISE PREDICTION (AIRCRAFT)
Methodology for multiaircraft minimum noise impact landing trajectories
A82-23037
Study of cabin noise control for twin engine general aviation aircraft
[NASA-CR-165833] N82-18995
Annoyance caused by propeller airplane flyover noise: Preliminary results
[NASA-TM-83244] N82-18996
Aircraft noise prediction program theoretical manual, part 1
[NASA-TM-83199-PT-1] N82-19946
Aircraft noise prediction program theoretical manual, part 2
[NASA-TM-83199-PT-2] N82-19947

NOISE PROPAGATION
Study of cabin noise control for twin engine general aviation aircraft
[NASA-CR-165833] N82-18995

NOISE REDUCTION
Methodology for multiaircraft minimum noise impact landing trajectories
A82-23037
Transparency development needs for military aircraft in the 1980's
A82-24302
The measurement of the mobility of structures at acoustic frequencies
N82-18149
Study of cabin noise control for twin engine general aviation aircraft
[NASA-CR-165833] N82-18995
Optimal aircraft landing patterns for minimal noise impact
N82-19200
Acoustic measurements of F100-PW-100 engine operating in hush house NSN 4920-02-070-2721
[AD-A108814] N82-19952
An experimental study of the effects of an inlet flow conditioner on the noise of a low speed axial flow fan --- in an aircraft engine
[TT-8101] N82-19956

NOISE SPECTRA
The measurement of the mobility of structures at acoustic frequencies
N82-18149

NOISE TOLERANCE
Effects of repetition rate and impulsiveness of simulated helicopter rotor noise on annoyance
[NASA-TP-1969] N82-19707

NONDESTRUCTIVE TESTS
High-frequency monitoring of surface layers of metals
A82-23603
NDE of composite rotor blades during fatigue testing
A82-24713

NONLINEAR FILTERS
Apparatus for damping operator induced oscillations of a controlled system --- flight control
[NASA-CASE-FRC-11041-1] N82-18493

NONLINEAR SYSTEMS
Describing function analysis of nonlinear nose gear shimmy
[ASME PAPER 81-WA/DSC-20] A82-24565
Analysis of a nonlinear altitude tracking method
[AD-A108878] N82-19197

NONLINEARITY
The effects of slight non-linearities on modal testing of helicopter-like structures
N82-18130

NOSE WHEELS
Describing function analysis of nonlinear nose gear shimmy
[ASME PAPER 81-WA/DSC-20] A82-24565

NOZZLE FLOW
Problems of numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles
A82-25347

Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane
[NASA-TM-83250] N82-19181
NOZZLE GEOMETRY
Effect of facility variation on the acoustic characteristics of three single stream nozzles
[NASA-TM-81635] N82-19944
NUMERICAL ANALYSIS
A complete method for computation of blade mode characteristics and responses in forward flight
N82-18126
NUMERICAL CONTROL
Distributed intelligence for air fleet control
[AD-A108611] N82-18195
Software features applicable to inertial measurement unit self alignment
[AD-A108511] N82-18196
NUMERICAL FLOW VISUALIZATION
Problems of numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles
A82-25347
The problem of calculation of the flow around helicopter rotor blade tips
N82-18160
Separated flow around helicopter bodies
N82-18163

O

OBLIQUE WINGS
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183
OCEANOGRAPHIC PARAMETERS
United States Coast Pilot 9. Pacific and Arctic Coasts Alaska: Cape Spencer to Beaufort Sea
[PB82-109562] N82-18201
OH-13 HELICOPTER
Evolution of the Aeroscout
A82-24706
ONBOARD DATA PROCESSING
Propulsion multiplexer /MUX/ system - The missing link
[SAE PAPER 811078] A82-24411
Flight test data acquisition and interpretation
A82-24707
An on board supervisory system for applications in space missions
[INPE-2097-RPE/327] N82-18216
ONBOARD EQUIPMENT
Navigational aids on-board the Concorde
A82-24065
The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
[SAE PAPER 811036] A82-24398
OPERATING COSTS
Management of powerplant maintenance and restoration programs for fuel conservation
[SAE PAPER 811052] A82-24394
Restoration of performance, Models 727, 737, and 747
[SAE PAPER 811072] A82-24406
Aircraft/airport compatibility - A constant challenge for aircraft designers
A82-25119
Parametric study of the influence of the engine upon the operating cost of a civil helicopter
N82-18131
Parametric criteria and impact on design trends
N82-18139
Potential reductions in aircraft operation and maintenance costs by using thrust computing support equipment
[AD-A108463] N82-18207
OPERATING SYSTEMS (COMPUTERS)
Air traffic control en route computer system
[GPO-89-008] N82-19202
OPERATOR PERFORMANCE
Reducing reflections on the front surface of air traffic control displays
A82-23314
OPERATORS (PERSONNEL)
Task analytic techniques: Application to the design of a flight simulator instructor/operator console
[AD-A108724] N82-18227
OPTICAL MEASUREMENT
A new angular deviation measurement device for aircraft transparencies
A82-24308
OPTICAL PATHS
GTD terrain reflection model applied to ILS glide scope --- Geometrical Theory of Diffraction
A82-23027
OPTICAL REFLECTION
Reducing reflections on the front surface of air traffic control displays
A82-23314
OPTIMAL CONTROL
Analysis and optimization of control systems in piloted flight vehicles --- Russian book
A82-22398
Sensitivity reduction by double perfect model following --- with application to aircraft control
A82-23029
Extension of proportional navigation by the use of optimal filtering and control methods
[ESA-TT-683] N82-18199
Multivariable aircraft control by maneuver commands: An application to air to surface gunnery
N82-19154
A method for applying linear optimal control theory to the design of a regulator for a flexible aircraft --- improving riding quality in fighter aircraft
[NLR-TR-80032-U] N82-19212
OPTIMIZATION
Parametric criteria and impact on design trends
N82-18139
A concept for a fuel efficient flight planning aid for general aviation
[NASA-CR-3533] N82-19217
OSCILLATING FLOW
Developments in rotary wing aircraft aerodynamics
N82-18120
Interpretation and construction of a dynamic similarity model of the A 310 wings
[MBB-FE-17/S/PUB/42] N82-18212
OSCILLATION DAMPERS
Apparatus for damping operator induced oscillations of a controlled system --- flight control
[NASA-CASE-FRC-11041-1] N82-18493

P

PARAMETER IDENTIFICATION
Sensitivity reduction by double perfect model following --- with application to aircraft control
A82-23029
Aircraft parameter identification in the presence of atmospheric turbulence
A82-23227
PARAMETERIZATION
Parametric criteria and impact on design trends
N82-18139
PASSENGER AIRCRAFT
Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning
A82-23470
Development of maintenance programmes through the functional, structural and flight test phases
A82-24003
Fuel-efficient windshields for transport, commuter and business aircraft
A82-24304
The reliability and safety of small passenger aircraft
A82-24972
A study to define the research and technology requirements for advanced turbo/propfan transport aircraft
[NASA-CR-166138] N82-18202
PASSENGERS
Air transportation of handicapped persons
A82-24330
PAVEMENTS
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230
PERFORMANCE PREDICTION
Design technology for improved performance retention in turbofan engines
[SAE PAPER 811055] A82-24392

Performance retention features of the PW2037 [SAE PAPER 811054] A82-24409
Reliability analysis of a dual-redundant engine controller [SAE PAPER 811077] A82-24410
Helicopter rotor load prediction A82-24719
Foundations for computer simulation of a low pressure oil flooded single screw air compressor [AD-A108230] N82-19391
PERFORMANCE TESTS
A new facility and technique for two-dimensional aerodynamic testing [AIAA 82-0608] A82-24677
PERIODIC VARIATIONS
Application of the ONER dynamic stall model to a helicopter blade in forward flight N82-18161
PHASE ERROR
Antenna (selected articles) [AD-A108174] N82-19448
PHASE RULE
A further study of helicopter rotor pitch-flap-phase coupling [BU-259] N82-19214
PHASE VELOCITY
Antenna (selected articles) [AD-A108174] N82-19448
PHYSICAL FITNESS
Air transportation of handicapped persons A82-24338
PHYSICAL PROPERTIES
The effects of absorbed moisture upon the physical properties of stretched acrylic materials A82-24320
PHYSIOLOGICAL EFFECTS
Physiological acceptability tests of the SJU-5/A ejection seat: Second physiological acceptance demonstration [AD-A108688] N82-18194
PILOT PERFORMANCE
Analysis and optimization of control systems in piloted flight vehicles --- Russian book A82-22398
Combined multisensor displays --- image preprocessing for shape coding to reduce pilot workload A82-22905
Transparency design decisions - Assessing their impact on visual performance A82-24306
PIPES (TUBES)
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding [AD-A109377] N82-19209
PITCHING MOMENTS
A further study of helicopter rotor pitch-flap-phase coupling [BU-259] N82-19214
PLASMA DISPLAY DEVICES
Lightweight ATC systems A82-23321
PLASTIC AIRCRAFT STRUCTURES
Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings A82-24301
Abrasion resistant coated plastic products for aircraft A82-24310
Proposed method for abrasion testing transparent plastics and coatings A82-24311
Acrylic - A timely review A82-24317
Problems associated with the quality assurance of stretched acrylic sheet A82-24319
The effects of absorbed moisture upon the physical properties of stretched acrylic materials A82-24320
PLASTIC COATINGS
Abrasion resistant coated plastic products for aircraft A82-24310
Proposed method for abrasion testing transparent plastics and coatings A82-24311
Aircraft surface coatings for drag reduction/erosion protection [SAE PAPER 811070] A82-24401
PLUMES
Fuel-rich plume combustion [AD-A108136] N82-18349
POLARIMETERS
TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km [AD-A108182] N82-18464
POLLUTION CONTROL
Evaluation of the North Island A/C crash/rescue training facility [AD-A108740] N82-18228
POLYMERIC FILMS
Problems associated with the quality assurance of stretched acrylic sheet A82-24319
The use of 'Kapton' polyimide film in aerospace applications [SAE PAPER 811091] A82-24413
PORTABLE EQUIPMENT
Portable transparency optical test system /P-TOTS/ A82-24309
POSITION (LOCATION)
Loran for precise position location - The VIEW-NAV system A82-24648
A possible way of specifically correcting location and navigational errors caused by reflection and other propagation anomalies [ESA-TT-667] N82-18198
POSITION ERRORS
The application of NAVSTAR differential GPS in the civilian community A82-24645
Loran-C RNAV in mountainous areas A82-24649
A possible way of specifically correcting location and navigational errors caused by reflection and other propagation anomalies [ESA-TT-667] N82-18198
POSITION INDICATORS
Wide field of view laser beacon system for three-dimensional aircraft position measurement [ASME PAPER 81-WA/DSC-9] A82-24563
POTENTIAL FLOW
The problem of calculation of the flow around helicopter rotor blade tips N82-18160
POTENTIAL THEORY
On the calculation of transonic blade tip flow for helicopter rotors [MBB-UD-320-81-O] N82-18187
POWER CONDITIONING
Advanced generating system technology A82-24380
Power systems N82-19146
POWER EFFICIENCY
Recent improvements in aircraft Ni-Cd cells A82-24245
PRECIPITATION (METEOROLOGY)
Aircraft measurements and analysis of severe storms: 1976 field experiment [NASA-CR-168519] N82-18803
PRESSING (FORMING)
Lucas stretched acrylic A82-24318
PRESSURE DISTRIBUTION
Separated flow around helicopter bodies N82-18163
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts [NASA-CR-165852] N82-19167
The effect of a well on the aerodynamics of a spoiler --- wind tunnel flow visualization and pressure measurement [BU-268] N82-19194
PRESSURE GRADIENTS
The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel [BU-263] N82-19231
PRESSURE PULSES
Effects of repetition rate and impulsiveness of simulated helicopter rotor noise on annoyance [NASA-TP-1969] N82-19707

PRESSURE RATIO
  Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82
  [NASA-TP-1974] N82-19222
PRESSURE SENSORS
  Pressure transducer calibration process
  [SAE PAPER 811076] A82-24408
PROCESS CONTROL (INDUSTRY)
  Managing computer aided design; Proceedings of the Conference, London, England, November 19, 1980
  A82-24371
PROCESS HEAT
  Open-cycle vapor compression heat pump
  [PB82-110503] N82-18553
PRODUCT DEVELOPMENT
  Evolution of the Aeroscout
  A82-24706
  SH-608 test program
  N82-18141
  Army Lynx: Product development matched to military combat development
  N82-18143
  A design study of the Marshal --- lightweight twin-engined aircraft
  [BU-262] N82-19215
  Cooled variable-area radial turbine technology program
  [NASA-CR-165408] N82-19221
PRODUCTION ENGINEERING
  Managing computer aided design; Proceedings of the Conference, London, England, November 19, 1980
  A82-24371
PROGRAM VERIFICATION (COMPUTERS)
  A program testing assistant
  [AD-A108147] N82-18922
PROJECT MANAGEMENT
  A310 - Design for maintenance
  A82-24002
PROPAGATION MODES
  Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
  [ASME PAPER 81-WA/NCA-13] A82-24602
PROPELLER BLADES
  Preliminary thoughts on helicopter cabin noise prediction methods
  N82-18148
  Study of cabin noise control for twin engine general aviation aircraft
  [NASA-CR-165833] N82-18995
PROPELLER FANS
  A study to define the research and technology requirements for advanced turbo/propfan transport aircraft
  [NASA-CR-166138] N82-18202
PROPELLER SLIPSTREAMS
  Static pressure in the slipstream of a propeller
  A82-24023
PROPELLERS
  An extension of the local momentum theory to the rotors operating in twisted flow field
  N82-18123
  Annoyance caused by propeller airplane flyover noise: Preliminary results
  [NASA-TM-83244] N82-18996
  Collection and evaluation of propeller aircraft noise certification data
  [DFVLR-MITT-81-20] N82-19958
PROPORTIONAL CONTROL
  Extension of proportional navigation by the use of optimal filtering and control methods
  [ESA-TT-683] N82-18199
PROPULSION SYSTEM CONFIGURATIONS
  A propulsion view of the all-electric airplane
  N82-19136
PROPULSION SYSTEM PERFORMANCE
  Propulsion multiplexer /PMUX/ system - The missing link
  [SAE PAPER 811078] A82-24411
  Prediction of off-design performance of turbo-shaft engines a simplified method
  N82-18132
  Three-engine control system for the prototype EH-101 helicopter
  [ARDG-9/81-1568L] N82-18135
PROTECTION
  Electrical ground testing of aircraft antistatic protection
  N82-19156
PROTECTIVE COATINGS
  Abrasion resistant coated plastic products for aircraft
  A82-24310
PROTOTYPES
  Three-engine control system for the prototype EH-101 helicopter
  [ARDG-9/81-1568L] N82-18135
PSYCHOACOUSTICS
  Annoyance caused by propeller airplane flyover noise: Preliminary results
  [NASA-TM-83244] N82-18996
PULSE DOPPLER RADAR
  Scanning strategies for air traffic control radars
  A82-24646
PULSE RATE
  Effects of repetition rate and impulsiveness of simulated helicopter rotor noise on annoyance
  [NASA-TP-1969] N82-19707
PYLONS
  Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
  [NASA-CR-165852] N82-19167

Q

QUALITY CONTROL
  Problems associated with the quality assurance of stretched acrylic sheet
  A82-24319
  Technology for quality and quantity in a new fighter
  [SAE PAPER 811100] A82-24404
QUARTZ TRANSDUCERS
  Pressure transducer calibration process
  [SAE PAPER 811076] A82-24408

RADIO ANTENNAS
  Calculation and measurement of electric field strength for airborne antennas in the LF/HF range
  A82-25011
RADIO ATTENUATION
  The coupling of electromagnetic interference into aircraft systems
  A82-24354
RADIO COMMUNICATION
  Voice communications - The vital link
  A82-23324
RADIO EQUIPMENT
  Utilization of radio equipment at airports and on airways --- Russian book
  A82-22407
RADIO FREQUENCY INTERFERENCE
  FM broadcast interference related to airborne ILS, VOR and VHF communications
  [RTCA/DO-176] N82-19419
  Investigation of technical requirements
  N82-19420

Investigation of airborne VHF communication and navigation equipment
N82-19421

Investigation of the effects of airborne installation factors on receiver interference
N82-19422

FAA/FCC coordination procedures for FM broadcast stations
N82-19423

RADIO FREQUENCY SHIELDING
Materials aspects of aircraft EMC design
A82-24358

RADIO RECEIVERS
A marine NAVSTAR GPS receiver
A82-24644

Loran for precise position location - The VIEW-NAV system
A82-24648

A possible way of specifically correcting location and navigational errors caused by reflection and other propagation anomalies
[ESA-TT-667] N82-18198

TM/TE polarization ratios in a sample of 30 kHz sferics received at altitudes from 0 to 70 km
[AD-A108182] N82-18464

FM broadcast interference related to airborne ILS, VOR and VHF communications
[RTCA/DO-176] N82-19419

Investigation of technical requirements
N82-19420

Investigation of the effects of airborne installation factors on receiver interference
N82-19422

RADIO RELAY SYSTEMS
Beyond the horizon coverage for air navigation/traffic control
A82-24647

RADIO SCATTERING
A possible way of specifically correcting location and navigational errors caused by reflection and other propagation anomalies
[ESA-TT-667] N82-18198

RADIO TRANSMITTERS
The variation of induced currents in aircraft wiring
A82-24355

RADIOGRAPHY
High-frequency monitoring of surface layers of metals
A82-23603

RAIN
C-5A austere airfield operational utility evaluation. Phase 2: Operation on unpaved soil surfaces following rainfall
[AD-A108597] N82-18208

RAMJET ENGINES
Fuel-rich plume combustion
[AD-A108136] N82-18349

RANGE ERRORS
Stereographic projection in the National Airspace System
A82-23031

REAL TIME OPERATION
NAS system load - Utilization of the DARC system
A82-23315

A Microwave Landing System simulation
A82-23323

RECEIVERS
Global positioning system timing receivers in the DSN
N82-20126

REDUNDANCY
A redundancy concept for a digital CSAS
N82-18170

REDUNDANT COMPONENTS
Reliability analysis of a dual-redundant engine controller
[SAE PAPER 811077] A82-24410

REGULATIONS
Designing for continued airworthiness - General aviation
[SAE PAPER 811038] A82-24397

Point of view of a helicopter manufacturer on airworthiness regulations
N82-18137

RELIABILITY
Assessment of Avionic Equipment Field Reliability and Maintainability as Functions of Unit Cost
[AD-A109373] N82-19218

RELIABILITY ANALYSIS
Reliability centered maintenance /RCM/
A82-24001

Reliability analysis of a dual-redundant engine controller
[SAE PAPER 811077] A82-24410

Analysis of loran-C system reliability for civil aviation
A82-24650

RELIABILITY ENGINEERING
The inter-relation between design, construction and maintenance
A82-24010

Recent improvements in aircraft Ni-Cd cells
A82-24245

High temperature engine control electronics
[SAE PAPER 811074] A82-24407

REMOTE SENSING
Wide field of view laser beacon system for three-dimensional aircraft position measurement
[ASME PAPER 81-WA/DSC-9] A82-24563

REMOTE SENSORS
Combined multisensor displays --- image preprocessing for shape coding to reduce pilot workload
A82-22905

REQUIREMENTS
Analytical study of cockpit information requirements
[AD-A108524] N82-18218

RESCUE OPERATIONS
LAMPS III recovery assist, securing and traversing /RAST/ system --- Light Airborne Multi-Purpose System
[SAE PAPER 811080] A82-24412

RESEARCH AND DEVELOPMENT
Windshield system structural enhancement
A82-24312

AFWAL turbine engine controls research and development - Present and future
[AIAA PAPER 82-0321] A82-25050

RESEARCH FACILITIES
Aeronautical Research Laboratories Structures Division
[AD-A109049] N82-19161

RESPONSE BIAS
Flutter and time response analyses of three degree of freedom airfoils in transonic flow
[AD-A108987] N82-19227

REVERSED FLOW
Dilution jet behavior in the turn section of a reverse flow combustor
[NASA-TM-82776] N82-19220

REVISIONS
Naval versions of the Dauphin and the AS 15 TT weapon system
N82-18142

REYNOLDS NUMBER
A new facility and technique for two-dimensional aerodynamic testing
[AIAA 82-0608] A82-24677

RIDING QUALITY
A method for applying linear optimal control theory to the design of a regulator for a flexible aircraft --- improving riding quality in fighter aircraft
[NLR-TR-80032-U] N82-19212

RIGID ROTORS
Flight characteristics design and development of the MBB/KHI BK117 helicopter
N82-18150

A general purpose program for rotor blade dynamics
N82-18151

Helicopter rotor downwash: Results of experimental research at the DFVLR-rotor test stand and their comparison with theoretical results
N82-18158

RIGIDITY
Interpretation and construction of a dynamic similarity model of the A 310 wings
[MBB-FE-17/S/PUB/42] N82-18212

ROTARY STABILITY
A further study of helicopter rotor pitch-flap-phase coupling
[BU-259] N82-19214

ROTARY WING AIRCRAFT
Rotorcraft flight simulation computer program C81 with DATAMAP interface. Volume 2: Programmer's manual
[AD-A108294] N82-18231
Design study into a high endurance mini-rotorcraft
[BU-265] N82-19216
ROTARY WINGS
Structural testing of composites with known defects A82-24700
Fatigue test of the typical main rotor controls component A82-24715
Helicopter rotor load prediction A82-24719
Seventh European Rotorcraft and Powered Lift Aircraft Forum N82-18119
Developments in rotary wing aircraft aerodynamics N82-18120
A simplified approach to the free wake analysis of a hovering rotor N82-18121
An experimental analysis of the shape of a rotor wake N82-18122
An extension of the local momentum theory to the rotors operating in twisted flow field N82-18123
A complete method for computation of blade mode characteristics and responses in forward flight N82-18126
Wind tunnel investigation of high speed rotor noise N82-18146
Prediction of blade vortex interaction noise from measured blade pressure N82-18147
A general purpose program for rotor blade dynamics N82-18151
Optimum performance and wake geometry of co-axial rotor in hover N82-18156
A numerical approach to co-axial rotor aerodynamics N82-18157
Helicopter rotor downwash: Results of experimental research at the DFVLR-rotor test stand and their comparison with theoretical results N82-18158
Hover tests of a model H-force rotor N82-18159
The problem of calculation of the flow around helicopter rotor blade tips N82-18160
Application of the ONERA dynamic stall model to a helicopter blade in forward flight N82-18161
Some unsteady aerodynamic effects on helicopter rotors N82-18162
An analytical investigation of the free-tip rotor for helicopters
[NASA-TM-81345] N82-18179
On the calculation of transonic blade tip flow for helicopter rotors
[MBB-UD-320-81-O] N82-18187
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding
[AD-A109377] N82-19209
Effects of repetition rate and impulsiveness of simulated helicopter rotor noise on annoyance
[NASA-TP-1969] N82-19707
ROTATION
An extension of the local momentum theory to the rotors operating in twisted flow field N82-18123
ROTOR AERODYNAMICS
Seventh European Rotorcraft and Powered Lift Aircraft Forum N82-18119
Developments in rotary wing aircraft aerodynamics N82-18120
A simplified approach to the free wake analysis of a hovering rotor N82-18121
An extension of the local momentum theory to the rotors operating in twisted flow field N82-18123
A simplified method for predicting rotor blade airloads N82-18124
Hover tests of a model H-force rotor N82-18159
The problem of calculation of the flow around helicopter rotor blade tips N82-18160
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 3: Aerodynamics and Structures Session
[NASA-TM-84147] N82-19172
A further study of helicopter rotor pitch-flap-phase coupling
[BU-259] N82-19214
Design study into a high endurance mini-rotorcraft
[BU-265] N82-19216
ROTOR BLADES (TURBOMACHINERY)
NDE of composite rotor blades during fatigue testing A82-24713
Seventh European Rotorcraft and Powered Lift Aircraft Forum N82-18119
Developments in rotary wing aircraft aerodynamics N82-18120
A simplified approach to the free wake analysis of a hovering rotor N82-18121
An experimental analysis of the shape of a rotor wake N82-18122
A simplified method for predicting rotor blade airloads N82-18124
A three-dimensional approach to lift and moment coefficients of rotating blades N82-18125
A complete method for computation of blade mode characteristics and responses in forward flight N82-18126
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test N82-18127
ROTOR LIFT
A three-dimensional approach to lift and moment coefficients of rotating blades N82-18125
ROTOR SPEED
An extension of the local momentum theory to the rotors operating in twisted flow field N82-18123
A simplified method for predicting rotor blade airloads N82-18124
Wind tunnel investigation of high speed rotor noise N82-18146
ROTOR SYSTEMS RESEARCH AIRCRAFT
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 3: Aerodynamics and Structures Session
[NASA-TM-84147] N82-19172
ROTORCRAFT AIRCRAFT
Tethered rotorplatforms and their mission potential N82-18145
RUNWAY CONDITIONS
Oscillations and vibrations of aircraft on runways A82-24974
C-5A austere airfield operational utility evaluation. Phase 2: Operation on unpaved soil surfaces following rainfall
[AD-A108597] N82-18208
Investigation into the utility of some quick setting cements for runway repair
[B-80-157/60.7.0157] N82-18225
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230
RUNWAYS
Bomb crater repair techniques for permanent airfields. Report 1: Series 1 tests
[AD-A108716] N82-18229
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230

S

S-N DIAGRAMS
Hypothetical fatigue life problem - Application of Aerospatiale method
A82-24716

SAFETY DEVICES
Disengagement of safety harness buckles - CT4
[AD-A109048] N82-19199

SANDWICH STRUCTURES
Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures
[NASA-CR-165827] N82-19358

SATELLITE SOUNDING
Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data
A82-25113

SCALE MODELS
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183

SCINTILLATION COUNTERS
Linear alpha-ray altimeter
A82-23225

SEALERS
Novel metal-ceramics-composite sealing coatings in aircraft engines
A82-24803

SEALING
Investigation into the utility of some quick setting cements for runway repair
[D-80-157/60.7.0157] N82-18225

SECONDARY RADAR
Secondary radar problems - The presence of false echoes
A82-25323

SELF ADAPTIVE CONTROL SYSTEMS
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind just load decrease and examination of its effectiveness in stochastic gusts
[MBB-FE-172/S/PUB/39-PT-1] N82-19228

SELF ALIGNMENT
Software features applicable to inertial measurement unit self alignment
[AD-A108511] N82-18196

SENSITIVITY
Sensitivity reduction by double perfect model following --- with application to aircraft control
A82-23029

SENSORS
The influence of sensor and actuator characteristics on overall helicopter AFCS design
N82-18171

SEPARATED FLOW
Separated flow around helicopter bodies
N82-18163

A method of predicting fuselage loads in hover
N82-18164

On the calculation of separated flow on helicopter fuselages
[MBB-UD-321-81-0] N82-18188

SERVICE LIFE
Boeing's big, quiet 737-300
A82-23369

A method of determining safe service life for helicopter components
A82-24709

Hughes helicopters - Fatigue life methodology
A82-24710

SERVOCONTROL
On-line control for the regulation of power source in multiple-servo electro-hydraulic systems
[ASME PAPER 81-WA/DSC-3] A82-24562

SHAFTS (MACHINE ELEMENTS)
Application of fatigue, crack propagation and strain survey testing to the CH-46 aft rotor drive shaft
A82-24705

SHIELDING
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

SHORT TAKEOFF AIRCRAFT
Review of defense-related vertical and short takeoff and landing (V/STOL) aircraft programs
[GPO-55-278] N82-18205

XFV-12A diagnostic and development programs
[AD-A108354] N82-18206

NASA/FAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary
[NASA-TM-84149] N82-19170

NASA/FAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views
[NASA-TM-84148] N82-19171

NASA/FAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors
[NASA-TM-84146] N82-19173

Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

SIDELOBE REDUCTION
Secondary radar problems - The presence of false echoes
A82-25323

SIGNAL PROCESSING
A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors
[RAE-TM-RAD-NAV-145] N82-18503

SIGNATURE ANALYSIS
The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel
[BU-263] N82-19231

SIZE DETERMINATION
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[AIAA PAPER 80-0724] A82-24022

SKIN (STRUCTURAL MEMBER)
On the sonic fatigue life estimation of skin structures at room and elevated temperatures
A82-23678

SKIN FRICTION
Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet
[ASME PAPER 81-WA/FE-3] A82-24566

Laminar airfoils for transport aircraft
[ESA-TT-680] N82-18190

SLEDS
Test site instrumentation study. Volume 2: Crash 1 and crash 2 raw data
[PB82-111832] N82-18233

SLENDER BODIES
Review of support interference in dynamic tests
[AIAA 82-0594] A82-24668

SLOTTED WIND TUNNELS
Slotted wall test section for automotive aerodynamic test facilities
[AIAA 82-0585] A82-24661

SOIL MECHANICS
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230

SOIL MOISTURE
C-5A austere airfield operational utility evaluation. Phase 2: Operation on unpaved soil surfaces following rainfall
[AD-A108597] N82-18208

SOLID-SOLID INTERFACES
Diffusion bonding in superplastic forming/diffusion bonding
A82-23754

SOUND TRANSMISSION
Preliminary thoughts on helicopter cabin noise prediction methods
N82-18148

SPACE MISSIONS
NASA pocket statistics
[NASA-TM-84134] N82-19084

SPACE TRANSPORTATION
A study of flight control requirements for advanced, winged, earth-to-orbit vehicles with far-aft center-of-gravity locations
[NASA-CR-3491] N82-19226

SPACE TUGS
A study of flight control requirements for advanced, winged, earth-to-orbit vehicles with far-aft center-of-gravity locations
[NASA-CR-3491] N82-19226

SPACECRAFT CONTROL
An on board supervisory system for applications in space missions
[INPE-2097-RPE/327] N82-18216
SPACECRAFT PERFORMANCE
NASA pocket statistics
[NASA-TM-84134] N82-19084
SPACECRAFT PROPULSION
Electric Flight Systems
[NASA-CP-2209] N82-19134
Electric flight systems, overview
N82-19135

SPACECRAFT STRUCTURES
Electroforming of space and aircraft structures
[MBB-BB-491-O] N82-18419
SPEED CONTROL
High speed VSCF generator design consideration --- computer aided design for Variable Speed Constant Frequency generator
A82-24379
The effect of critical design parameters on the selection of a VSCF system
A82-24381
Packaging the VSCF system for an aircraft engine environment
A82-24383

SPEED INDICATORS
Evaluation of the helicopter low airspeed system LASSIE
N82-18172

SPEED REGULATORS
Three-engine control system for the prototype EH-101 helicopter
[AERG-9/81-1568L] N82-18135
SPIN REDUCTION
A criterion for the prediction of the recovery characteristics of spinning aircraft
[RAE-TM-AERO-2251] N82-19223
SPIN STABILIZATION
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183
SPOILER SLOT AILERONS
Spoilers or auxiliary flaps
A82-24973

SPOILERS
The effect of a well on the aerodynamics of a spoiler --- wind tunnel flow visualization and pressure measurement
[BU-268] N82-19194
SPRAY NOZZLES
Helicopter Icing Spray System (HISS) nozzle improvement evaluation
[AD-A109405] N82-19208
SQUALLS
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts
[MBB-FE-172/S/PUB/39-PT-1] N82-19228
STABILITY
Effects of fan inlet temperature disturbances on the stability of a turbofan engine
[NASA-TM-82699] N82-18222
STABILITY AUGMENTATION
A redundancy concept for a digital CSAS
N82-18170

STABILITY DERIVATIVES
Cross and cross-coupling derivative measurements on the standard dynamics model at AEDC
[AIAA 82-0596] A82-24670
An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft --- static wind tunnel force measurements
[NASA-CR-168578] N82-19224
STABILIZATION
Review of helicopter Mast Mounted Sight (MMS) base motion isolation and Line-of-Sight (LOS) stabilization concepts
N82-18166
Integration of inertial sensors in helicopters
N82-18173

STABILIZED PLATFORMS
Stability of a three-stage dynamic stand
A82-25353

Review of helicopter Mast Mounted Sight (MMS) base motion isolation and Line-of-Sight (LOS) stabilization concepts
N82-18166
Mast mounted visual aids
N82-18167
Software features applicable to inertial measurement unit self alignment
[AD-A108511] N82-18196
STANDARDIZATION
Airworthiness regulation: What is our strategy - What are the issues
A82-24006
The challenge of standardizing fatigue methodology
A82-24703

STANDARDS
Standardization of helicopter fatigue methodology - A manufacterer's view
A82-24704

STATIC AERODYNAMIC CHARACTERISTICS
The effect of a well on the aerodynamics of a spoiler --- wind tunnel flow visualization and pressure measurement
[BU-268] N82-19194
STATIC PRESSURE
Static pressure in the slipstream of a propeller
A82-24023

STATIC TESTS
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945
STATISTICAL ANALYSIS
Direct comparison of community response to road traffic noise and to aircraft noise
A82-22974
FAA statistical handbook of aviation
[AD-A109289] N82-19198
STATOR BLADES
Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82
[NASA-TP-1974] N82-19222
STEERING
Describing function analysis of nonlinear nose gear shimmy
[ASME PAPER 81-WA/DSC-20] A82-24565
STEREOSCOPY
Stereographic projection in the National Airspace System
A82-23031

STIFFNESS MATRIX
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127

STOCKPILING
Where is cobalt irreplaceable
A82-25538

STORMS (METEOROLOGY)
Aircraft measurements and analysis of severe storms: 1976 field experiment
[NASA-CR-168519] N82-18803
STRESS ANALYSIS
Application of fatigue, crack propagation and strain survey testing to the CH-46 aft rotor drive shaft
A82-24705
A compilation of stress intensity factor solutions for flawed fastener holes
[AD-A108753] N82-18628
STRESS CONCENTRATION
Material/structure degradation due to fretting and fretting-initiated fatigue
A82-23771

STRESS CORROSION CRACKING
A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum
A82-23772

STRESS INTENSITY FACTORS
A compilation of stress intensity factor solutions for flawed fastener holes
[AD-A108753] N82-18628
STRETCH FORMING
Problems associated with the quality assurance of stretched acrylic sheet
A82-24319

STRETCHING
Lucas stretched acrylic A82-24318

STRUCTURAL ANALYSIS
Development of maintenance programmes through the functional, structural and flight test phases A82-24003
MSG-3 structures --- inspection program for aircraft maintenance A82-24011
Application of damage tolerance technology to type certification [SAE PAPER 811062] A82-24388
Structural modeling of high Reynolds number wind tunnel models [AIAA 82-0602] A82-24674
Structural testing of composites with known defects A82-24708

STRUCTURAL DESIGN
Impact of systems technology and integration on helicopter design N82-18165

STRUCTURAL DESIGN CRITERIA
Design philosophy of the Hughes model 600 helicopter N82-18140
SH-608 test program N82-18141

STRUCTURAL ENGINEERING
Aeronautical Research Laboratories Structures Division [AD-A109049] N82-19161

STRUCTURAL FAILURE
D.C.9 windshield - Effect of attachment retorque A82-24324
Application of damage tolerance technology to type certification [SAE PAPER 811062] A82-24388
Fundamentals of helicopter fatigue life determination A82-24714

STRUCTURAL RELIABILITY
Windshield system structural enhancement A82-24312

STRUCTURAL WEIGHT
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance [AIAA PAPER 80-0724] A82-24022

SUBSONIC AIRCRAFT
Tendencies in the development of subsonic transport aircraft with special consideration of aerodynamics [ESA-TT-705] N82-18214

SUBSONIC WIND TUNNELS
Status and capabilities of the National Full Scale Facility 40- by 80-foot wind tunnel modification [AIAA 82-0607] A82-24676
A new facility and technique for two-dimensional aerodynamic testing [AIAA 82-0608] A82-24677

SUPERCRITICAL FLOW
A new facility and technique for two-dimensional aerodynamic testing [AIAA 82-0608] A82-24677

SUPERCRITICAL WINGS
Design of supercritical swept wings A82-23826
Structural modeling of high Reynolds number wind tunnel models [AIAA 82-0602] A82-24674
Flutter and time response analyses of three degree of freedom airfoils in transonic flow [AD-A108987] N82-19227

SUPERPLASTICITY
Diffusion bonding in superplastic forming/diffusion bonding A82-23754
Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures [NASA-CR-165827] N82-19358

SUPERSONIC AIRCRAFT
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance [AIAA PAPER 80-0724] A82-24022

SUPERSONIC FLOW
Oscillating supersonic/hypersonic wings at high incidence A82-23828

SUPERSONIC WIND TUNNELS
Mean flow and noise measurements in a Mach 3.5 pilot quiet tunnel [AIAA 82-0569] A82-24657

SUPPORT INTERFERENCE
Review of support interference in dynamic tests [AIAA 82-0594] A82-24668

SURFACE LAYERS
High-frequency monitoring of surface layers of metals A82-23603
Electroforming of space and aircraft structures [MBB-BB-491-0] N82-18419

SURFACE REACTIONS
Improving the accuracy of the estimates of surfactant content in jet fuels A82-23250

SURFACE ROUGHNESS
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels [AIAA 82-0603] A82-24675

SURFACE TEMPERATURE
Engine superficial temperature and infrared signature N82-18136

SURFACE VEHICLES
Direct comparison of community response to road traffic noise and to aircraft noise A82-22974

SURFACTANTS
Improving the accuracy of the estimates of surfactant content in jet fuels A82-23250

SWEPT WINGS
Design of supercritical swept wings A82-23826
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test [AIAA 82-0568] A82-24656

SWEPTBACK WINGS
History of the sweptback wing [DGLR PAPER 81-070] A82-22898
Investigations of the separation behavior on airfoils at high angles of attack, using linear lift theory [MBB-FE-122/S/PUB/37] N82-18189

SYSTEM EFFECTIVENESS
Prediction of off-design performance of turbo-shaft engines a simplified method N82-18132
Measurement techniques used to assess the installed power of a helicopter engine N82-18133
Component design and development for future helicopter engines N82-18134
Assessment of aircraft capacitive circuit medium wave antennas according to their efficiency N82-19453

SYSTEMS ANALYSIS
Analysis and optimization of control systems in piloted flight vehicles --- Russian book A82-22398
Analysis of system problems using aviation safety reporting system data A82-23312
NAS system load - Utilization of the DABC system A82-23315
Distributed data processing modeling for future ATC systems A82-23319
A method for the investigation of gyrostabilization systems A82-24892
SH-608 test program N82-18141
A light helicopter for night firing N82-18144
Task analytic techniques: Application to the design of a flight simulator instructor/operator console [AD-A108724] N82-18227

SYSTEMS ENGINEERING
The use of dynamic mock-ups in the design of advanced systems --- USAF's Digital Avionic Information System and NAVY's Advanced Integrated Display System A82-22902

Design technology for improved performance retention in turbofan engines
[SAE PAPER 811055] A82-24392

A new facility and technique for two-dimensional aerodynamic testing
[AIAA 82-0608] A82-24677

The influence of sensor and actuator characteristics on overall helicopter AFCS design
N82-18171

Transport aircraft cockpit standardization (Federal Aviation regulations part 25)
[AD-A108924] N82-19207

SYSTEMS INTEGRATION

The use of dynamic mock-ups in the design of advanced systems --- USAF's Digital Avionic Information System and NAVY's Advanced Integrated Display System
A82-22902

The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
[SAE PAPER 811036] A82-24398

Impact of systems technology and integration on helicopter design
N82-18165

Integration of inertial sensors in helicopters
N82-18173

Integrated control design techniques
[AD-A108223] N82-18224

Electric flight systems integration
N82-19150

National Airspace Data Interchange Network (NADIN) support of Remote Maintenance Monitoring System (RMMS)
[AD-A109125] N82-19160

T

TAIL ASSEMBLIES

An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft --- static wind tunnel force measurements
[NASA-CR-168578] N82-19224

TAKEOFF RUNS

A digital simulation program describing the motion of an aircraft undergoing engine failure during its takeoff ground roll
[AD-A108420] N82-18210

TARGET ACQUISITION

Tethered rotorplatforms and their mission potential
N82-18145

TARGET RECOGNITION

Tethered rotorplatforms and their mission potential
N82-18145

TECHNOLOGICAL FORECASTING

ATC automation - A look forward: Technology/architecture

[GPO-55-278] N82-18205

NASA/NAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary
[NASA-TM-84149] N82-19170

NASA/NAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views
[NASA-TM-84148] N82-19171

NASA/NAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors
[NASA-TM-84146] N82-19173

TECHNOLOGY TRANSFER

Impact of systems technology and integration on helicopter design
N82-18165

TECHNOLOGY UTILIZATION

Lightweight ATC systems
A82-23321

Novel approaches to electron beam welding machine utilization
A82-23753

TELEVISION CAMERAS

Equipment for testing and measuring a "helmet mounted sight and display" system with a coupled movable TV camera in the flight simulator for research of the DFVLR
[ESA-TT-675] N82-19219

TEMPERATURE CONTROL

Problems associated with the quality assurance of stretched acrylic sheet
A82-24319

TEMPERATURE DISTRIBUTION

Engine superficial temperature and infrared signature
N82-18136

TEMPERATURE EFFECTS

Effects of fan inlet temperature disturbances on the stability of a turbofan engine
[NASA-TM-82699] N82-18222

TERRAIN ANALYSIS

GTD terrain reflection model applied to ILS glide scope --- Geometrical Theory of Diffraction
A82-23027

TEST FACILITIES

Air cooled engine test facilities
A82-24004

Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers
A82-24651

Slotted wall test section for automotive aerodynamic test facilities
[AIAA 82-0585] A82-24661

Evaluation of the North Island A/C crash/rescue training facility
[AD-A108740] N82-18228

Test site instrumentation study. Volume 2: Crash 1 and crash 2 raw data
[PB82-111832] N82-18233

Equipment for testing and measuring a "helmet mounted sight and display" system with a coupled movable TV camera in the flight simulator for research of the DFVLR
[ESA-TT-675] N82-19219

Acoustic measurements of F100-PW-100 engine operating in hush house NSN 4920-02-070-2721
[AD-A108814] N82-19952

TEST STANDS

Stability of a three-stage dynamic stand
A82-25353

Further development of the test concept of the ALPHA JET engine LARZAC 04
N82-18223

TETHERLINES

Tethered rotorplatforms and their mission potential
N82-18145

THEOREMS

A study of the techniques of dynamic analysis of helicopter type structures
N82-18129

THERMAL EXPANSION

Operating flight loads and their effect on engine performance
[SAE PAPER 811071] A82-24405

THERMAL INSULATION

The use of 'Kapton' polyimide film in aerospace applications
[SAE PAPER 811091] A82-24413

THERMAL STRESSES

Acoustic fatigue endurance test of USB flap structure models at elevated temperature
[NAL-TR-683] N82-19570

THERMODYNAMIC EFFICIENCY
Lineup of the LM-series aircraft-derivative gas turbines
A82-22896

THIN FILMS
High-frequency monitoring of surface layers of metals
A82-23603

THREE DIMENSIONAL BOUNDARY LAYER
Investigations of the separation behavior on airfoils at high angles of attack, using linear lift theory
[MBB-FE-122/S/PUB/37] N82-18189

THREE DIMENSIONAL FLOW
Transonic wind tunnel wall interference corrections for three-dimensional models
[AIAA 82-0588] A82-24663
Problems of numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles
A82-25347
A three-dimensional approach to lift and moment coefficients of rotating blades
N82-18125
On the calculation of transonic blade tip flow for helicopter rotors
[MBB-UD-320-81-O] N82-18187

THREE DIMENSIONAL MOTION
Wide field of view laser beacon system for three-dimensional aircraft position measurement
[ASME PAPER 81-WA/DSC-9] A82-24563

THRUST AUGMENTATION
XFV-12A diagnostic and development programs
[AD-A108354] N82-18206

THRUST CONTROL
Potential reductions in aircraft operation and maintenance costs by using thrust computing support equipment
[AD-A108463] N82-18207

THRUST MEASUREMENT
Potential reductions in aircraft operation and maintenance costs by using thrust computing support equipment
[AD-A108463] N82-18207

THRUST VECTOR CONTROL
Fighters - Tomorrow's terminology
A82-23368

TILT ROTOR AIRCRAFT
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 3: Aerodynamics and Structures Session
[NASA-TM-84147] N82-19172

TIME DIVISION MULTIPLEXING
A design for a 32-channel multiplexer --- for unmanned aircraft navigation sensors
[RAE-TM-RAD-NAV-145] N82-18503

TIMING DEVICES
Global positioning system timing receivers in the DSN
N82-20126

TITANIUM ALLOYS
Welding for low-cost advanced titanium airframe structures
A82-23757
Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures
[NASA-CR-165827] N82-19358

TOPOGRAPHY
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels
[AIAA 82-0603] A82-24675

TORQUE
D.C.9 windshield - Effect of attachment retorque
A82-24324
Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility
[NASA-TP-1959] N82-18204

TRACKED VEHICLES
The Link-Miles driver training simulator for tracked vehicles: The effect of method and duration of training on the transfer of training
[IZF-1980-28] N82-18226

TRACKING (POSITION)
Analysis of a nonlinear altitude tracking method
[AD-A108878] N82-19197

TRACKING NETWORKS
On the calculation of separated flow on helicopter fuselages
[MBB-UD-321-81-O] N82-18188

TRAILING-EDGE FLAPS
Slotted variable camber flap
[NASA-CASE-LAR-12541-1] N82-18203

TRAINING AIRCRAFT
Disengagement of safety harness buckles - CT4
[AD-A109048] N82-19199

TRAINING DEVICES
Task analytic techniques: Application to the design of a flight simulator instructor/operator console
[AD-A108724] N82-18227

TRAINING EVALUATION
Evaluation of the North Island A/C crash/rescue training facility
[AD-A108740] N82-18228

TRAINING SIMULATORS
Computer-generated images for simulators - The cost of technology
A82-22881
The Link-Miles driver training simulator for tracked vehicles: The effect of method and duration of training on the transfer of training
[IZF-1980-28] N82-18226

TRAJECTORY OPTIMIZATION
Methodology for multiaircraft minimum noise impact landing trajectories
A82-23037
Optimal aircraft landing patterns for minimal noise impact
N82-19200

TRANSFER OF TRAINING
The Link-Miles driver training simulator for tracked vehicles: The effect of method and duration of training on the transfer of training
[IZF-1980-28] N82-18226

TRANSHORIZON RADIO PROPAGATION
Beyond the horizon coverage for air navigation/traffic control
A82-24647

TRANSONIC COMPRESSORS
Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.78, respectively, and with design pressure ratio of 1.82
[NASA-TP-1974] N82-19222

TRANSONIC FLOW
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test
[AIAA 82-0568] A82-24656
On the calculation of transonic blade tip flow for helicopter rotors
[MBB-UD-320-81-O] N82-18187
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
[NASA-CR-165852] N82-19167
Flutter and time response analyses of three degree of freedom airfoils in transonic flow
[AD-A108987] N82-19227

TRANSONIC FLUTTER
Recent developments in wing with stores flutter suppression
[ONERA, TP NO. 1981-145] A82-24077

TRANSONIC WIND TUNNELS
The effect of ejector augmentation on test-section flow quality in the Calspan 8-ft transonic wind tunnel
[AIAA 82-0571] A82-24658
Transonic wind tunnel wall interference corrections for three-dimensional models
[AIAA 82-0588] A82-24663
Development of a self-optimizing flexible technology /SOFT/ transonic wing wind tunnel model
[AIAA 82-0601] A82-24673
Structural modeling of high Reynolds number wind tunnel models
[AIAA 82-0602] A82-24674
Induction driven transonic wind tunnel T2: Operation at room temperature and cryogenic adaptation
N82-19158

TRANSPARENCE
Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings
A82-24301

Transparency development needs for military aircraft in the 1980's
A82-24302

Deficiencies and constraints that affect the design of cockpit enclosures and transparencies
A82-24303

Transparencies - What an aircraft designer should know
A82-24305

Transparency design decisions - Assessing their impact on visual performance
A82-24306

Aircraft transparency design guide
A82-24307

A new angular deviation measurement device for aircraft transparencies
A82-24308

Portable transparency optical test system /P-TOTS/
A82-24309

Abrasion resistant coated plastic products for aircraft
A82-24310

Proposed method for abrasion testing transparent plastics and coatings
A82-24311

Windshield system structural enhancement
A82-24312

The role of finite element analysis in the design of birdstrike resistant transparencies
A82-24314

Aircraft transparency bird impact analysis using the MAGNA computer program
A82-24315

Acrylic - A timely review
A82-24317

Lucas stretched acrylic
A82-24318

The effects of absorbed moisture upon the physical properties of stretched acrylic materials
A82-24320

TRANSPORT AIRCRAFT

Reliability centered maintenance /RCM/
A82-24001

Fuel-efficient windshields for transport, commuter and business aircraft
A82-24304

Airworthiness considerations in the design of commercial transport aircraft
[SAE PAPER 811039] A82-24396

Aircraft surface coatings for drag reduction/erosion protection
[SAE PAPER 811070] A82-24401

The cargo helicopter - A logistical vehicle
A82-24717

Advanced electronic displays and their potential in future transport aircraft
A82-25216

Laminar airfoils for transport aircraft
[ESA-TT-680] N82-18190

C-5A austere airfield operational utility evaluation. Phase 2: Operation on unpaved soil surfaces following rainfall
[AD-A108597] N82-18208

Tendencies in the development of subsonic transport aircraft with special consideration of aerodynamics
[ESA-TT-705] N82-18214

Transport aircraft cockpit standardization (Federal Aviation regulations part 25)
[AD-A108924] N82-19207

Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane
[NASA-TP-1966] N82-19225

TRAVELING WAVES

Antenna (selected articles)
[AD-A108174] N82-19448

Assessment of aircraft capacitive circuit medium wave antennas according to their efficiency
N82-19453

TRENDS

Trends in airline avionics
[NLR-MP-80013-U] N82-18220

TRUCKS

Vehicle test report: Battronic pickup truck
[NASA-CR-168637] N82-19205

TURBINE BLADES

Seventh European Rotorcraft and Powered Lift Aircraft Forum
N82-18119

TURBINE ENGINES

Cooled variable-area radial turbine technology program
[NASA-CR-165408] N82-19221

TURBINE EXHAUST NOZZLES

Prediction of off-design performance of turbo-shaft engines a simplified method
N82-18132

TURBOFAN AIRCRAFT

A study to define the research and technology requirements for advanced turbo/propfan transport aircraft
[NASA-CR-166138] N82-18202

TURBOFAN ENGINES

Design technology for improved performance retention in turbofan engines
[SAE PAPER 811055] A82-24392

Management of powerplant maintenance and restoration programs for fuel conservation
[SAE PAPER 811052] A82-24394

Operating flight loads and their effect on engine performance
[SAE PAPER 811071] A82-24405

Performance retention features of the PW2037
[SAE PAPER 811054] A82-24409

A study to define the research and technology requirements for advanced turbo/propfan transport aircraft
[NASA-CR-166138] N82-18202

Effects of fan inlet temperature disturbances on the stability of a turbofan engine
[NASA-TM-82699] N82-18222

Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

TURBOJET ENGINES

Low grade fuels for turbo and jet engines
A82-23439

TURBOPROP AIRCRAFT

Engine superficial temperature and infrared signature
N82-18136

A study to define the research and technology requirements for advanced turbo/propfan transport aircraft
[NASA-CR-166138] N82-18202

TURBOPROP ENGINES

Engine superficial temperature and infrared signature
N82-18136

A study to define the research and technology requirements for advanced turbo/propfan transport aircraft
[NASA-CR-166138] N82-18202

TURBOSHAFTS

Prediction of off-design performance of turbo-shaft engines a simplified method
N82-18132

Measurement techniques used to assess the installed power of a helicopter engine
N82-18133

TURBULENT JETS

Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet
[ASME PAPER 81-WA/FE-3] A82-24566

TURNING FLIGHT

Efficient combinations of numerical techniques applied to aircraft turning performance optimization
A82-24814

Midair and near midair collisions on two- and three-dimensional curvilinear flight paths
[ESA-TT-685] N82-18200

U

UNSTEADY FLOW

Angle of downwash behind a wing in unsteady flow
A82-24970

Problems of numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles
A82-25347

UPPER SURFACE BLOWING

Acoustic fatigue endurance test of USB flap structure models at elevated temperature
[NAL-TR-683] N82-19570

USER MANUALS (COMPUTER PROGRAMS)
Rotorcraft flight simulation computer program C81 with DATAMAP interface. Volume 2: Programmer's manual
[AD-A108294] N82-18231
USER REQUIREMENTS
Military requirements: Too little or too much
N82-18138
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 1: Executive Summary
[NASA-TM-84149] N82-19170
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 2: Operators' Views
[NASA-TM-84148] N82-19171
NASA/HAA Advanced Rotorcraft Technology and Tilt Rotor Workshops. Volume 4: Flight Control Avionics Systems and Human Factors
[NASA-TM-84146] N82-19173

V

V/STOL AIRCRAFT
The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators
[AIAA PAPER 82-2635] A82-25154
VANES
Hover tests of a model H-force rotor
N82-18159
VARIABLE SWEEP WINGS
Mission-adaptive wing flight demonstration program
[SAE PAPER 811035] A82-24399
VELOCITY DISTRIBUTION
Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet
[ASME PAPER 81-WA/FE-3] A82-24566
VELOCITY ERRORS
The application of NAVSTAR differential GPS in the civilian community
A82-24645
VERTICAL AIR CURRENTS
Aircraft measurements and analysis of severe storms: 1976 field experiment
[NASA-CR-168519] N82-18803
VERTICAL FLIGHT
Prediction of blade vortex interaction noise from measured blade pressure
N82-18147
VERTICAL TAKEOFF
A study of flight control requirements for advanced, winged, earth-to-orbit vehicles with far-aft center-of-gravity locations
[NASA-CR-3491] N82-19226
VERTICAL TAKEOFF AIRCRAFT
Review of defense-related vertical and short takeoff and landing (V/STOL) aircraft programs
[GPO-55-278] N82-18205
VERY HIGH FREQUENCY RADIO EQUIPMENT
FM broadcast interference related to airborne ILS, VOR and VHF communications
[RTCA/DO-176] N82-19419
Investigation of the effects of airborne installation factors on receiver interference
N82-19422
VHF OMNIRANGE NAVIGATION
FM broadcast interference related to airborne ILS, VOR and VHF communications
[RTCA/DO-176] N82-19419
Investigation of technical requirements
N82-19420
Investigation of airborne VHF communication and navigation equipment
N82-19421
VIBRATION
Vibration levels in Army helicopters: Measurement recommendations and data
[AD-A108131] N82-18209
VIBRATION DAMPING
Oscillations and vibrations of aircraft on runways
A82-24974
Review of helicopter Mast Mounted Sight (MMS) base motion isolation and Line-of-Sight (LOS) stabilization concepts
N82-18166
VIBRATION EFFECTS
Hypothetical fatigue life problem - Application of Aerospatiale method
A82-24716
VIBRATION ISOLATORS
The measurement of the mobility of structures at acoustic frequencies
N82-18149
VIBRATION MEASUREMENT
Vibration levels in Army helicopters: Measurement recommendations and data
[AD-A108131] N82-18209
Structural system identification technology verification
[AD-A109181] N82-19583
VIBRATION TESTS
Lineup of the IM-series aircraft-derivative gas turbines
A82-22896
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127
Vibration levels in Army helicopters: Measurement recommendations and data
[AD-A108131] N82-18209
VIBRATORY LOADS
Mast mounted visual aids
N82-18167
VIDEO EQUIPMENT
Mast mounted visual aids
N82-18167
VISCOUS FLOW
Problems of numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles
A82-25347
VISIBILITY
Deficiencies and constraints that affect the design of cockpit enclosures and transparencies
A82-24303
Transparency design decisions - Assessing their impact on visual performance
A82-24306
VISORS
Concorde glazings - 5 years of Mach 2 service
A82-24326
VISUAL AIDS
Mast mounted visual aids
N82-18167
Experimental investigation of visual aids for helicopters: Low level flight at night and poor visibility
N82-18168
VISUAL FLIGHT
Midair and near midair collisions on two- and three-dimensional curvilinear flight paths
[ESA-TT-685] N82-18200
VISUAL PERCEPTION
Transparency design decisions - Assessing their impact on visual performance
A82-24306
VOICE COMMUNICATION
Voice communications - The vital link
A82-23324
VOLTAGE GENERATORS
Design considerations of DC-Link aircraft generation systems
A82-24377
Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States
A82-24382
VORTEX SHEETS
A method of predicting fuselage loads in hover
N82-18164
VORTICES
The requirements for reduced IFR separations on final approach
A82-23311
Prediction of blade vortex interaction noise from measured blade pressure
N82-18147
Optimum performance and wake geometry of co-axial rotor in hover
N82-18156
A numerical approach to co-axial rotor aerodynamics
N82-18157
Helicopter rotor downwash: Results of experimental research at the DFVLR-rotor test stand and their comparison with theoretical results
N82-18158

Simulator study of vortex encounters by a twin-engine, commercial, jet transport airplane
[NASA-TP-1966] N82-19225

W

WALL FLOW
Transonic wind tunnel wall interference corrections for three-dimensional models
[AIAA 82-0588] A82-24663

WALL JETS
Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet
[ASME PAPER 81-WA/FE-3] A82-24566

WALL PRESSURE
The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel
[BU-263] N82-19231

WARNING SYSTEMS
AN/ALQ-135 tail warning system follow-on operational test and evaluation
[AD-A108348] N82-18471

WASTE ENERGY UTILIZATION
Open-cycle vapor compression heat pump
[PB82-110503] N82-18553

WATER
Improving the accuracy of the estimates of surfactant content in jet fuels
A82-23250

WEAPON SYSTEMS
F/A-18 weapon system development
A82-23774
Future strike fighter options - Concepts and technologies
[SAE PAPER 811099] A82-24403
Fighter issues - 2000
[SAE PAPER 811096] A82-24415
Naval versions of the Dauphin and the AS 15 TT weapon system
N82-18142
A light helicopter for night firing
N82-18144

WEAPONS DEVELOPMENT
F/A-18 weapon system development
A82-23774

WEAR TESTS
Monitoring engine wear by oil analysis
A82-24012
Proposed method for abrasion testing transparent plastics and coatings
A82-24311

WEIGHT REDUCTION
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[AIAA PAPER 80-0724] A82-24022
Fuel-efficient windshields for transport, commuter and business aircraft
A82-24304
The development of high strength light-weight windshields for the new generation of Boeing 757 and 767 airliners
A82-24323
Advanced generating system technology
A82-24380

WEIGHTING FUNCTIONS
Noise measurements on the helicopter BK 117 design. Weighted noise levels and influence of airspeed
[DFVLR-MITT-81-18] N82-19957

WELDABILITY
Aluminum and its alloys - Weldability
A82-23755

WELDED STRUCTURES
Welding for low-cost advanced titanium airframe structures
A82-23757

WELDING
Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980
A82-23751

WELDING MACHINES
Novel approaches to electron beam welding machine utilization
A82-23753

WHEEL BRAKES
Dynamics of aircraft antiskid braking systems --- conducted at the Langley aircraft landing loads and traction facility
[NASA-TP-1959] N82-18204

WIND MEASUREMENT
Wind and temperature database for flight planning
[SAE PAPER 811068] A82-24305

WIND SHEAR
Development of a clear air radar to detect meteorological hazards at airports
[AD-A108236] N82-18835

WIND TUNNEL APPARATUS
The effect of ejector augmentation on test-section flow quality in the Calspan 8-ft transonic wind tunnel
[AIAA 82-0571] A82-24658
An ejector augmented choking valve for the metering and control of inlet and bleed duct flows
[AIAA 82-0575] A82-24659
Status and capabilities of the National Full Scale Facility 40- by 80-foot wind tunnel modification
[AIAA 82-0607] A82-24676

WIND TUNNEL CALIBRATION
The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel
[BU-263] N82-19231

WIND TUNNEL MODELS
Cross and cross-coupling derivative measurements on the standard dynamics model at AEDC
[AIAA 82-0596] A82-24670
Development of a self-optimizing flexible technology /SOFT/ transonic wing wind tunnel model
[AIAA 82-0601] A82-24673
Structural modeling of high Reynolds number wind tunnel models
[AIAA 82-0602] A82-24674
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels
[AIAA 82-0603] A82-24675
The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators
[AIAA PAPER 82-2635] A82-25154
Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane
[NASA-TM-83250] N82-19181

WIND TUNNEL NOZZLES
Mean flow and noise measurements in a Mach 3.5 pilot quiet tunnel
[AIAA 82-0569] A82-24657

WIND TUNNEL STABILITY TESTS
Review of support interference in dynamic tests
[AIAA 82-0594] A82-24668

WIND TUNNEL TESTS
History of the sweptback wing
[DGLR PAPER 81-070] A82-22898
Recent developments in wing with stores flutter suppression
[ONERA, TP NO. 1981-145] A82-24077
Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers
A82-24651
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test
[AIAA 82-0568] A82-24656
Technical innovations in testing and analysis of heat and pressure models in hypersonic wind tunnels
[AIAA 82-0578] A82-24660
Slotted wall test section for automotive aerodynamic test facilities
[AIAA 82-0585] A82-24661
The use of a multi-degree-of-freedom dual balance system to measure cross and cross-coupling derivatives
[AIAA 82-0595] A82-24669
Separated flow around helicopter bodies
N82-18163
Evaluation of the helicopter low airspeed system LASSIE
N82-18172
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183

ROBINSON, J. C.
Structural modeling of high Reynolds number wind tunnel models

[BU-262] N82-19215

SULZER, R.
Transport aircraft cockpit standardisation (Federal Aviation regulations part 25)
[AD-A108924] N82-19207

Multiple ejection effects analysis
[AD-A108277] N82-18192
Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane
[NASA-TM-83250] N82-19181
On the design of some airfoils for sailplane application --- additions to existing wings for inflight testing
[VTH-LR-326] N82-19213
An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft --- static wind tunnel force measurements
[NASA-CR-168578] N82-19224
A study of flight control requirements for advanced, winged, earth-to-orbit vehicles with far-aft center-of-gravity locations
[NASA-CR-3491] N82-19226

WIND TUNNEL WALLS
Transonic wind tunnel wall interference corrections for three-dimensional models
[AIAA 82-0588] A82-24663
The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel
[BU-263] N82-19231

WINDMILLS (WINDPOWERED MACHINES)
An extension of the local momentum theory to the rotors operating in twisted flow field
N82-18123
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
N82-18127

WINDSHIELDS
Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings
A82-24301
Transparency development needs for military aircraft in the 1980's
A82-24302
Deficiencies and constraints that affect the design of cockpit enclosures and transparencies
A82-24303
Fuel-efficient windshields for transport, commuter and business aircraft
A82-24304
Transparencies - What an aircraft designer should know
A82-24305
Aircraft transparency design guide
A82-24307
A new angular deviation measurement device for aircraft transparencies
A82-24308
Proposed method for abrasion testing transparent plastics and coatings
A82-24311
Windshield system structural enhancement
A82-24312
The role of finite element analysis in the design of birdstrike resistant transparencies
A82-24314
The development of high strength light-weight windshields for the new generation of Boeing 757 and 767 airliners
A82-24323
D.C.9 windshield - Effect of attachment retorque
A82-24324
B.A.C. One-Eleven flight deck glazing product improvement
A82-24325
Concorde glazings - 5 years of Mach 2 service
A82-24326

WING CAMBER
Slotted variable camber flap
[NASA-CASE-LAR-12541-1] N82-18203

WING FLAPS
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

WING LOADING
Structural modeling of high Reynolds number wind tunnel models
[AIAA 82-0602] A82-24674

Some unsteady aerodynamic effects on helicopter rotors
N82-18162

WING NACELLE CONFIGURATIONS
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
[NASA-CR-165852] N82-19167

WING OSCILLATIONS
Oscillating supersonic/hypersonic wings at high incidence
A82-23828
Recent developments in wing with stores flutter suppression
[ONERA, TP NO. 1981-145] A82-24077
Application of the ONERA dynamic stall model to a helicopter blade in forward flight
N82-18161

WING PLANFORMS
YF-16 design concept and philosophy
A82-23444

WING PROFILES
Mission-adaptive wing flight demonstration program
[SAE PAPER 811035] A82-24399
Transonic wind tunnel wall interference corrections for three-dimensional models
[AIAA 82-0588] A82-24663
Development of a self-optimizing flexible technology /SOFT/ transonic wing wind tunnel model
[AIAA 82-0601] A82-24673
Structural modeling of high Reynolds number wind tunnel models
[AIAA 82-0602] A82-24674

WING SLOTS
Slotted variable camber flap
[NASA-CASE-LAR-12541-1] N82-18203

WING TIPS
Hover tests of a model H-force rotor
N82-18159
An analytical investigation of the free-tip rotor for helicopters
[NASA-TM-81345] N82-18179
On the design of some airfoils for sailplane application --- additions to existing wings for inflight testing
[VTH-LR-326] N82-19213

WINGS
Angle of downwash behind a wing in unsteady flow
A82-24970
XFV-12A diagnostic and development programs
[AD-A108354] N82-18206

WIRE CLOTH
Metal honeycomb to porous wireform substrate diffusion bond evaluation
[NASA-TM-82793] N82-18612

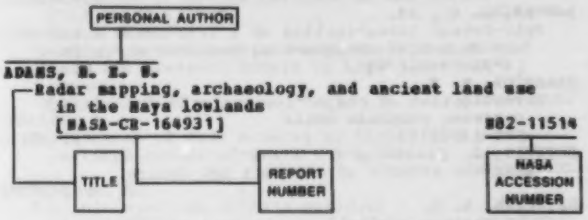
WIRING
The variation of induced currents in aircraft wiring
A82-24355

WORKLOADS (PSYCHOPHYSIOLOGY)
Combined multisensor displays --- image preprocessing for shape coding to reduce pilot workload
A82-22905
Utilizing the helicopter's versatility to improve the ATC system
A82-23316

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 149)* **JUNE 1982**

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ABBINK, F. J.
Trends in airline avionics
[NLR-MP-80013-U] N82-18220
ABDELWAHAB, M.
Effects of fan inlet temperature disturbances on the stability of a turbofan engine
[NASA-TM-82699] N82-18222
ABELLA, E. L.
The toll of ILS-preventable aviation accidents
A82-25325
AGARWAL, J. C.
Where is cobalt irreplaceable
A82-25536
AHLSWEDE, M.
Collection and evaluation of propeller aircraft noise certification data
[DFVLR-MITT-81-20] N82-19958
ALDINIO, G.
The Agusta's solution of AHS's hypothetical fatigue life problem
A82-24701
ALGER, R. S.
Evaluation of the North Island A/C crash/rescue training facility
[AD-A108740] N82-18228
ALLAVENA, A. M.
Engine superficial temperature and infrared signature
N82-18136
ALLI, P.
The Agusta's solution of AHS's hypothetical fatigue life problem
A82-24701
ALLISON, J. W.
Airline fuel saving through JT9D engine refurbishment
[SAE PAPER 811051] A82-24395
ALTMAN, D.
The challenge of standardizing fatigue methodology
A82-24703
ANDERS, K. P.
Noise measurements on the helicopter BK 117 design. Weighted noise levels and influence of airspeed
[DFVLR-MITT-81-18] N82-19957
Collection and evaluation of propeller aircraft noise certification data
[DFVLR-MITT-81-20] N82-19958
ANDERSON, E. C.
Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test
[AIAA 82-0568] A82-24656
ANDREWS, D. G.
Slotted variable camber flap
[NASA-CASE-LAR-12541-1] N82-18203
ANTONAZZI, F., SR.
Pressure transducer calibration process
[SAE PAPER 811076] A82-24408
ARENDT, R. H.
Test site instrumentation study. Volume 2: Crash 1 and crash 2 raw data
[PB82-111832] N82-18233
ARVIN, G. H.
Evaluation of superplastic forming and co-diffusion bonding of Ti-6Al-4V titanium alloy expanded sandwich structures
[NASA-CR-165827] N82-19358
ASCHENBACH, J. W.
Reducing reflections on the front surface of air traffic control displays
A82-23314
AZUMA, A.
An extension of the local momentum theory to the rotors operating in twisted flow field
N82-18123
A numerical approach to co-axial rotor aerodynamics
N82-18157

B

BAER, J. C.
Restoration of performance, Models 727, 737, and 747
[SAE PAPER 811072] A82-24406
BAILEY, R. O.
The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators
[AIAA PAPER 82-2635] A82-25154
BAKER, S. M.
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels
[AIAA 82-0603] A82-24675
BALLIN, M. G.
An experimental study of the effect of tail configuration on the spinning characteristics of general aviation aircraft
[NASA-CR-160578] N82-19224
BARAM, Y.
Fixed gain controller design for aircraft
A82-23441
BASH, J.
Calculation and measurement of electric field strength for airborne antennas in the LF/HF range
A82-25011
BASKERVILLE, E. W.
Materials aspects of aircraft EMC design
A82-24358
BAUMEISTER, K. J.
Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts
[ASME PAPER 81-WA/NCA-13] A82-24602
BAVITZ, P. C.
Future strike fighter options - Concepts and technologies
[SAE PAPER 811099] A82-24403
BEARD, M. C.
Airworthiness regulation: What is our strategy - What are the issues
A82-24006
BECKER, F. E.
Open-cycle vapor compression heat pump
[PB82-110503] N82-18553

SUN, C. C.
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
[NASA-CR-165852] N82-19167

SURESH, B. N.
On-line control for the regulation of power source in multiple-servo electro-hydraulic systems
[ASME PAPER 81-WA/DSC-3] A82-24562

SWARTZ, W. F.
The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
[SAE PAPER 811036] A82-24398

SWEDISH, W. J.
The requirements for reduced IFR separations on final approach
A82-23311

SWEET, L. M.
Wide field of view laser beacon system for three-dimensional aircraft position measurement
[ASME PAPER 81-WA/DSC-9] A82-24563

SWEETMAN, B.
Boeing's big, quiet 737-300
A82-23369

SWIFT, T.
Application of damage tolerance technology to type certification
[SAE PAPER 811062] A82-24388

SZCZEPONIK, K.
Experience during the development of the German-Japanese helicopter BK 117
[MBB-UD-318-81-0] N82-19210

T

TADGHIGHI, H.
Wind tunnel investigation of high speed rotor noise
N82-18146

TAKEDA, K.
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

TAKEO, K.
Lineup of the IM-series aircraft-derivative gas turbines
A82-22896

TAN, G. H.
A design study of the Marshal
[BU-262] N82-19215

TANIMOTO, E. Y.
A study of the effects of long-term exposure to fuels and fluids on the behavior of advanced composite materials
[NASA-CR-165763] N82-18327

TANNER, J. A.
Dynamics of aircraft antiskid braking systems
[NASA-TP-1959] N82-18204

TASK, H. L.
A new angular deviation measurement device for aircraft transparencies
A82-24308
Portable transparency optical test system /P-TOTS/
A82-24309

TAYLOR, P.
Preliminary investigation into the addition of auxiliary longitudinal thrust on helicopter agility
N82-18155
A method of predicting fuselage loads in hover
N82-18164

TAYLOR, R. S.
Design philosophy of the Hughes model 600 helicopter
N82-18140

TAYLOR, S. M.
Direct comparison of community response to road traffic noise and to aircraft noise
A82-22974

TEAGUE, E. C.
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels
[AIAA 82-0603] A82-24675

THOMAS, G. A.
Disengagement of safety harness buckles - CT4
[AD-A109048] N82-19199

THOMPSON, G. H.
Boeing Vertol fatigue life methodology
A82-24718

THORNDYKE, P. W.
Distributed intelligence for air fleet control
[AD-A108611] N82-18195

TKACH, M. J.
F/A-18 weapon system development
A82-23774

TORISAKI, T.
Aerodynamic noise generated by jet wing/flap interactions of the external USB configuration of STOL aircraft. Part 2: Full scale model experiment using FJR710 turbofan engine
[NAL-TR-687T-PT-2] N82-19945

TORNESE, R. A.
Active Beacon Collision Avoidance System (BCAS) logic performance during operational flight tests
[AD-A108893] N82-19203

TOTH, S.
Impact of technology on avionics cost trends
[AD-A108494] N82-18219

TOTTO, E. R.
MIL-STD 1553B - Aircraft EM environmental susceptibility effects
A82-24357

TRAHAN, C.
Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels
[AIAA 82-0603] A82-24675

TRAN, C. T.
Application of the ONER dynamic stall model to a helicopter blade in forward flight
N82-18161

TRIMBLE, J.
Combined multisensor displays
A82-22905

TRUE, H. C.
Wind and temperature database for flight planning
[SAE PAPER 811068] A82-24385

U

UNGVICHIAN, V.
GTD terrain reflection model applied to ILS glide scope
A82-23027

V

VAICAITIS, R.
Study of cabin noise control for twin engine general aviation aircraft
[NASA-CR-165833] N82-18995

VALEIKA, B.
MSG-3 overview
A82-24014

Midair and near midair collisions on two- and three-dimensional curvilinear flight paths
[ESA-TT-685] N82-18200

WEHAUSEN, J. V.
Annual review of fluid mechanics. Volume 14
A82-24416

WEIHE, V. I.
Beyond the horizon coverage for air navigation/traffic control
A82-24647

WEIS, D.
Perspectives for Controlled Weapons Technology: Report of the 90th Helicopter Forum
[MBB-UA-532-80-O] N82-19211

WEISEL, D. R.
Airline fuel saving through JT9D engine refurbishment
[SAE PAPER 811051] A82-24395

WEISS, F.
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts
[MBB-FE-172/S/PUB/39-PT-1] N82-19228

WEISSENBURGER, J. T.
Airport related residential acoustical insulation demonstration project: Report 1720
[PB82-100777] N82-19396

WESSON, R. B.
Distributed intelligence for air fleet control
[AD-A108611] N82-18195

WEST, B. S.
The role of finite element analysis in the design of birdstrike resistant transparencies
A82-24314

The effects of bird orientation on load profile and damage level
A82-24316

WHITE, H. V.
Software features applicable to inertial measurement unit self alignment
[AD-A108511] N82-18196

WHITE, M. L.
Development of manufacturing technology for fabrication of a composite helicopter main rotor spar by tubular braiding
[AD-A109377] N82-19209

WHITE, W. L.
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183

WILBY, P. G.
Some unsteady aerodynamic effects on helicopter rotors
N82-18162

WILFERT, K. E.
Aircraft/airport compatibility - A constant challenge for aircraft designers
A82-25119

WILKINSON, K. G.
Air transport in the 21st century
A82-24025

WILLIAMSON, J. R.
Diffusion bonding in superplastic forming/diffusion bonding
A82-23754

WILMS, V.
Novel metal-ceramics-composite sealing coatings in aircraft engines
A82-24803

WILSON, K. C.
Fuel-rich plume combustion
[AD-A108136] N82-18349

WINER, D. E.
Wind and temperature database for flight planning
[SAE PAPER 811068] A82-24385

WINKLER, E.
Characterization of the Airbus horizontal stabilizers of CFRP construction and structural analysis with the finite element method
[MBB-UT-13-81-O] N82-18213

WINKLER, P. M.
Loran for precise position location - The VIEW-NAV system
A82-24648

WISEMAN, M. P.
The pressure signature method for blockage corrections, and its applications to the industrial wind tunnel
[BU-263] N82-19231

WISER, G. L.
Fuel-efficient windshields for transport, commuter and business aircraft
A82-24304

WITTENBERG, H.
Prediction of off-design performance of turbo-shaft engines a simplified method
N82-18132

WONG, R. Y.
Wide field of view laser beacon system for three-dimensional aircraft position measurement
[ASME PAPER 81-WA/DSC-9] A82-24563

WONG, G. A.
Analysis of loran-C system reliability for civil aviation
A82-24650

WOODS, J., JR.
The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/
[SAE PAPER 811036] A82-24398

WORMSTONE, D. E.
EMC clearance of modern military aircraft
A82-24359

BECKER, J.
Active gust and maneuver load control concepts with the example of the Airbus A300. Part 1: Explanation of a regular in the time zone of wind gust load decrease and examination of its effectiveness in stochastic gusts
[MBB-FE-172/S/PUB/39-PT-1] N82-19228
BECKWITH, I. E.
Mean flow and noise measurements in a Mach 3.5 pilot quiet tunnel
[AIAA 82-0569] A82-24657
BEDDOES, J. C.
A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum
A82-23772
BEEDELL, D. A. E.
Design study into a high endurance mini-rotorcraft
[BU-265] N82-19216
BEIN, T. W.
Foundations for computer simulation of a low pressure oil flooded single screw air compressor
[AD-A108230] N82-19391
BELL, D. B.
Lucas stretched acrylic
A82-24318
BELTE, D.
Helicopter Icing Spray System (HISS) nozzle improvement evaluation
[AD-A109405] N82-19208
BERKEBILE, D. H.
The use of 'Kapton' polyimide film in aerospace applications
[SAE PAPER 811091] A82-24413
BERMAN, A.
Structural system identification technology verification
[AD-A109181] N82-19583

BOULET, J.
Point of view of a helicopter manufacturer on airworthiness regulations
N82-18137
BOWMAN, J. S., JR.
Spin-tunnel investigation of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft
[NASA-TM-83236] N82-18183
BRABSTON, W. N.
Investigation of compaction criteria for airport pavement subgrade soils
[AD-A108518] N82-18230
BRETTLE, J.
Materials aspects of aircraft EMC design
A82-24358
BREUHAUS, W. O.
C-5A austere airfield operational utility evaluation. Phase 2: Operation on unpaved soil surfaces following rainfall
[AD-A108597] N82-18208
BRITTON, K. H.
A-7E software module guide
[AD-A108649] N82-18920
BROGAN, W. L.
Improvements and extensions of the Geometrical Dilution of Precision (GDOP) concept for selecting navigation measurements
[AD-A108607] N82-18197
BROWN, R. A.
Concorde glazings - 5 years of Mach 2 service
A82-24326
BRUDNYI, E. O.
Assessment of aircraft capacitive circuit medium wave antennas according to their efficiency
N82-19453
BRUERE, A.
Electrical ground testing of aircraft antistatic protection
N82-19156
BUNJE, A. J.
Proposed method for abrasion testing transparent plastics and coatings
A82-24311
BURCAT, A.
Low grade fuels for turbo and jet engines
A82-23439
BURTON, R. W.
Analysis of the crossed dipole antenna as a model for aircraft in an electromagnetic environment
A82-25002
BURTON, T. D.
Describing function analysis of nonlinear nose gear shimmy
[ASME PAPER 81-WA/DSC-20] A82-24565

C

CABRIT, P.
Parametric study of the influence of the engine upon the operating cost of a civil helicopter
N82-18131
CALDWELL, J. D.
Analytical study of cockpit information requirements
[AD-A108524] N82-18218
CAMMARATA, S.
Distributed intelligence for air fleet control
[AD-A108611] N82-18195
CAMPBELL, W. C.
Development of a clear air radar to detect meteorological hazards at airports
[AD-A108236] N82-18835
CANDAU, J. F.
A light helicopter for night firing
N82-18144
CANTRELL, W. G.
Software features applicable to inertial measurement unit self alignment
[AD-A108511] N82-18196

CAREL, O.
The birth of precision DME
A82-24066

CARLSON, J. R.
Effects of installation of F101 DFE exhaust nozzles on the afterbody-nozzle characteristics of the F-14 airplane
[NASA-TM-83250] N82-19101

CARMINE, W. A.
Cost of ownership advantages with a shared oil system
A82-24378

CARRIERE, J. K.
Performance retention features of the PW2037
[SAE PAPER 811054] A82-24409

CARROLL, H. R.
Technical innovations in testing and analysis of heat and pressure models in hypersonic wind tunnels
[AIAA 82-0578] A82-24660

CASPARI, E.
Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning
A82-23470

CASTEEL, G. R.
Multiple ejection effects analysis
[AD-A108277] N82-18192

CENN, W. A.
The effect of a well on the aerodynamics of a spoiler
[BU-268] N82-19194

CERNOSEK, J.
Fatigue test of the typical main rotor controls component
A82-24715

CHABANNE, J. P.
Importance of a tactical cargo aircraft in emergency relief
A82-25499

CHADWICK, R. B.
Development of a clear air radar to detect meteorological hazards at airports
[AD-A108236] N82-18835

CHALLITA, A.
The effects of bird orientation on load profile and damage level
A82-24316

CHANG, R.
Methodology for multiaircraft minimum noise impact landing trajectories
A82-23037

CHANG, R. C. T.
Optimal aircraft landing patterns for minimal noise impact
N82-19200

CHAPMAN, D.
A program testing assistant
[AD-A108147] N82-18922

CHEESEMAN, I. C.
Developments in rotary wing aircraft aerodynamics
N82-18120
Wind tunnel investigation of high speed rotor noise
N82-18146

CHEN, C. H.
Flutter and time response analyses of three degree of freedom airfoils in transonic flow
[AD-A108987] N82-19227

CHINN, J. M.
Acoustic measurements of F100-PW-100 engine operating in hush house NSN 4920-02-070-2721
[AD-A108814] N82-19952

CHIUCHIOLO, E. A.
Three-engine control system for the prototype EH-101 helicopter
[AERG-9/81-1568L] N82-18135

CHRISTENSEN, J.
D.C.9 windshield - Effect of attachment retorque
A82-24324

CHUDYK, D. W.
The effect of ejector augmentation on test-section flow quality in the Calspan 8-ft transonic wind tunnel
[AIAA 82-0571] A82-24658

CLARK, P. J. F.
Slotted wall test section for automotive aerodynamic test facilities
[AIAA 82-0585] A82-24661

CLAY, C. W.
Electric flight systems

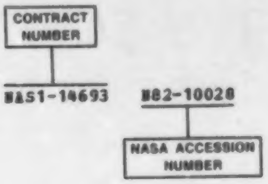
CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 382 reports, journal articles, and other documents originally announced in June 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

KOZLOWSKI, D. R.
Fighter issues - 2000
[SAE PAPER 811096] A82-24415

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report

David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. C.R.

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 150)

JULY 1982

IAA ENTRIES

A82-25560 **Introduction to the principles of fracture mechanics (Einführung in die Grundlagen der Bruchmechanik).** W. Dander (Wiederaufarbeitungsanlage Karlsruhe Betriebsgesellschaft mbH, Eggenstein-Leopoldshafen, West Germany). *Zeitschrift für Werkstofftechnik*, vol. 13, Feb. 1982, p. 69-76. In German.

The employment of fracture mechanics makes it possible to obtain vital information concerning the operational life of components of rotor and aircraft structures even in cases in which such information cannot be provided in connection with conventional design technology. Basic questions regarding the origin of cracks in material are discussed, taking into account the strength of solid bodies with ideal elastic characteristics, elementary processes leading to crack formation, and aspects of fracture description. Linear-elastic fracture mechanics is considered along with an energy criterion with respect to crack growth, the crack opening displacement, and the J integral method. Attention is given to basic fracture modes, the fracture mechanical equation and specimen configuration used to determine fracture, and the application of fracture mechanics methodology. G.R.

A82-25577 **Integration of multi-sensor navigation data using optimal estimation techniques.** D. B. Reid, W. S. Gesing, B. N. McWilliam (Philip A. Lapp, Ltd., Toronto, Canada), and J. E. Smyth (Canada Center For Remote Sensing, Ottawa, Canada). In: Conference on Decision and Control, 19th, and Symposium on Adaptive Processes, Albuquerque, NM, December 10-12, 1980, Proceedings. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 584, 585. 6 refs.

Optimal filtering and smoothing algorithms are used to obtain precise aircraft position, velocity and attitude information for remote sensing applications by postflight processing of navigation data collected by several sensors. The data from an Inertial Navigation System (INS) is differenced with data obtained from other sensors which may include photogrammetric resections, a microwave ranging system, a barometric altimeter, a radar altimeter, a laser radar, a VLF/OMEGA navigation system and doppler radar to construct error measurements. The measurements are prefiltered to compress the data and are then processed through a Kalman filter to produce estimates of the time-correlated sensor errors. The filtered error estimates are smoothed by processing backwards in time and used to correct the INS data. The track recovery program uses the UDU/T/ covariance factorized form of the filter algorithm and is capable of processing data from any subset of sensors. The residual errors observed in processing real data collected in a number of field tests are less than 1 meter in position and less than 0.03 degrees in attitude. (Author)

A82-25673 **Von Karman and VKI - The first 25 years.** J. J. Ginoux (Institut Von Karman de Dynamique des Fluides, Rhode-Saint-Genèse; Bruxelles, Université Libre, Brussels, Belgium). *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 6, Jan.-Feb. 1982, p. 27-34.

The Von Karman Institute (VKI) was established in October 1956 in the buildings of the aeronautical laboratory of the Belgian Civil Aviation Authority. The history of the laboratory goes back to 1922. The early history of the laboratory is considered, taking into account pioneering work on helicopters carried out between 1930 and 1940, the modernization of aerodynamic testing facilities after World War II, and von Karman's idea to use the laboratory for training students and research workers of the NATO countries in experimental techniques. A description is given of the approaches used to implement von Karman's idea, giving attention to the development of the VKI into the first truly international aerodynamics school. G.R.

A82-25771 **Some thoughts on design optimization of transport helicopters.** W. Z. Stepniewski and L. H. Sloan. *Vertica*, vol. 6, no. 1, 1982, p. 1-17. 12 refs.

A decrease in the total helicopter operating cost per revenue seat-nautical mile C sub rsm can be achieved by reducing total yearly expenditure for helicopter operation and by increasing annual work time, work speed, and number of revenue seats. Design improvements can lessen maintenance ground time. The most important aspect of design optimization with respect to the fuel-cost share in C sub rsm is the assurance of high gross weight to equivalent drag ratio values at the highest possible flying speeds, with lowest possible effect on aircraft purchase and maintenance costs. Among the factors influencing purchase cost are sharing of production costs, technical and organizational level of production facilities, and labor costs. In designing the power plant, maximization efforts should center around hovering and/or vertical climb aspects. Here disk loading appears to be the strongest design parameter. Finally, gains linked to structural weight increases are modest, although gains are higher when fuel costs decrease. C.D.

A82-25772 * **Model helicopter rotor low frequency broadband noise.** N. G. Humbad and W. L. Harris (MIT, Cambridge, MA). *Vertica*, vol. 6, no. 1, 1982, p. 19-35. 19 refs. Grant No. NsG-1583.

The results of an experimental investigation of low frequency broadband noise (LFBN) radiated from model helicopter rotors are presented. The results up to tip Mach number of 0.50 suggest that the peak sound pressure level (SPL) of LFBN appears to follow tip Mach number to a fourth power law and rms velocity of turbulence to a second power law. The experimental results on the effect of tip speed and advance ratio on the peak SPL of LFBN can be explained on the basis of a simple scaling law. However, the experimental results on the effect of blade loading on the peak SPL of LFBN is still not clearly understood. A simple peak SPL scaling law for noise from a helicopter in forward flight encountering a sinusoidal gust is also developed. The trends predicted by the scaling law with the experimental results are found satisfactory for the cases of variation of the peak SPL of LFBN with tip speed and advance ratio. C.D.

A82-25773 **Sensitivity of helicopter aeromechanical stability to dynamic inflow.** G. H. Gaonkar, A. K. Mitra, T. S. R. Reddy (Indian Institute of Science, Bangalore, India), and D. A. Peters (Washington University, St. Louis, MO). *Vertica*, vol. 6, no. 1, 1982, p. 59-75. 14 refs. NSF Grant No. CME-79-08304.

Since aeromechanical instability or 'resonance' of nonarticulated helicopters generally involves low-frequency flap and lead-lag regressing modes as well as a coupled rotor-body pitch or roll mode, it is expected to be appreciably influenced by dynamic inflow. Therefore, a resonance analysis in hover is presented with four objectives concerning (1) the effect of dynamic inflow on air and ground resonance, (2) the adequacy of the equivalent Lock number and drag coefficient to account for the effect, (3) the possible improvement in correlation with recent experimental data, with the inclusion of inflow and (4) a better understanding of the effect of rotor parameters on the resonance phenomena with dynamic inflow.

Present hazardous weather forecasts are reviewed, along with product generation and information dissemination methods, and system improvements for the 0-2 hr forecast (nowcast) are investigated. The problem of actually detecting or projecting hazardous weather conditions from sensor readings or computer-based cause and effect inferences is regarded as secondary to ensuring that the actual information reaches pilots, air traffic controllers, and aviation meteorologists. Current data gathering systems include rawinsondes, surface networks, weather satellites, and dedicated weather radar. Although subjective assessments of the combined data picture are possible, it is noted that en route weather information is lacking, although partially supplanted by pilot reports of threatening conditions. A high speed national network of nowcasts is being constructed which will provide real time combined weather information available to pilots and covering temporally short hazardous weather. M.S.K.

A82-27083 * # **Numerical solution of Space Shuttle Orbiter flow field.** E. Venkatapathy, J. C. Tannehill (Iowa State University of Science and Technology, Ames, IA), and J. V. Rakich (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0028.* 17 p. 35 refs. Research supported by the Iowa State University of Science and Technology; Grant No. NGR-16-002-038.

The supersonic, viscous laminar flow around the Space Shuttle Orbiter forebody has been computed with a parabolized Navier-Stokes code using a generalized coordinate transformation. The initial solution for the nose part of the Orbiter geometry was obtained with a three-dimensional time-dependent Navier-Stokes solver. It was necessary to employ a wind axis oriented coordinate system to obtain the initial solution with the time-dependent code. The generalized PNS technique used in this study allows the solution to be marched from the given initial data surface to any desired surface downstream. A grid point clustering scheme was employed to accurately describe the body shape by clustering points at the wing tip and at the wing body juncture. The computed heat transfer coefficients, pressure coefficients, and shock shapes are compared with the available experimental data for 0 degrees and 30 degrees angle of attack. (Author)

A82-27086 # **Experimental study of the flowfield of an airfoil with deflected spoiler.** B. G. McLachlan, K. Karamcheti (Stanford University, Stanford, CA), and F. van Leynseele (Boeing Commercial Airplane Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0126.* 9 p. 14 refs. Research supported by the Boeing Commercial Airplane Co.

An experimental study of the flow field generated by a typical two-dimensional airfoil-spoiler configuration is presented, in which subsonic tests ascertained the effects of varying such parameters as spoiler deflection and angle of attack, at Reynolds numbers of 280,000 and 520,000. Data gathered on static surface pressures, wake and boundary layer mean velocities and vortex shedding characteristics show that the spoiler wake is dominated by vortex shedding over a wide range of conditions, in agreement with other bluff body investigations of Strouhal number and base pressure coefficient. O.C.

A82-27087 # **An experimental and analytical study of mixing flow of turbofan engine exhaust through circular and 2-dimensional mixer/nozzle.** F. P. Saheli, R. L. Hanson, and B. F. Kerkham (Boeing Aerospace Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0130.* 9 p.

The results of a test program conducted to obtain plume temperature, nozzle wall temperature and nozzle flow coefficient data for two-dimensional nozzles, with and without forced mixing, indicate that an 18-lobe mixer achieved nearly complete mixing. Analytical predictions of exit temperature profiles and wall temperatures generated by a three-dimensional viscous flow computer program agreed well with test data for cases with and without the mixer. Although such specific features as the exact location of the peak temperature, in the case of mixer/nozzle simulation, were not predicted, major trends of total temperature distribution were simulated. It is shown by a comparison of measurements of two-dimensional nozzle thrust and flow coefficients with those of a circular nozzle, that the mixing efficiency gain due to the addition of an 18-lobe mixer is greater for the axisymmetric nozzle. (Author)

A82-27093 # **Heavy rain penalties for a flight simulator.** P. Haines and J. K. Luers (Dayton, University, Dayton, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0213.* 19 p. 7 refs.

A set of curves, representing lift and drag performance degradation of aircraft due to airfoil surface roughness effects under heavy rain, is established for application to flight simulators. Experimental data was analyzed to quantify the lift and drag increments of single- and multi-element airfoils, both for cases where distributed roughness elements uniformly cover the entire wing and where roughness elements begin at various locations aft of the leading edge. Simulated airfoil roughness is then related to rainfall rates and frost parameters, so that the performance penalty induced by a given environmental condition can be estimated. Flight simulator test results which include roughness effects may lead to revised procedures for aircraft takeoff, landing, and maneuvers under severe environmental conditions. O.C.

A82-27098 * # **Mathematical modeling of ice accretion on airfoils.** C. D. MacArthur, J. L. Keller, and J. K. Luers (Dayton, University, Dayton, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0284.* 18 p. 8 refs. Grant No. NAG3-65.

The progress toward development of a computer model suitable for predicting icing behavior on airfoils over a wide range of environmental conditions and airfoils shapes is reported. The LEWICE program was formulated to solve a set of equations which describe the physical processes which occur during accretion of ice on an airfoil, including heat transfer in a time dependent mode, with the restriction that the flow must be describable by a two-dimensional flow code. Input data comprises the cloud liquid water content, mean droplet diameter, ambient air temperature, air velocity, and relative humidity. A potential flowfield around the airfoil is calculated, along with the droplet trajectories within the flowfield, followed by local values of water droplet collection efficiency at the impact points. Both glaze and rime ice conditions are reproduced, and comparisons with test results on icing of circular cylinders showed good agreement with the physical situation. M.S.K.

A82-27109 **Quantitative interpretation of recirculated flow visualization by the analysis of video pictures.** P. Calvet, A. Giovannini, P. Hebrard, and G. Toulouse (ONERA, Département de Mécanique et Energétique des Systèmes, Toulouse, France). In: Flow visualization II; Proceedings of the Second International Symposium, Bochum, West Germany, September 9-12, 1980.
Washington, DC, Hemisphere Publishing Corp., 1982, p. 63-68.

The development of a television monitoring system for use in flow visualization studies in a hydrodynamic tunnel constructed at ONERA-CERT is detailed. In order to obtain quantitative results without recourse to large computer storage requirements, electronic coupling was devised between a video camera, microcomputer, and plotter for use in colorimetric and trajectographic experiments. Real-time information of local and time-averaged data was made available of dye tracers brightness or residence time. The wiring possesses four circuits: a reference window, a video experimental window for spatial analysis, scan line analysis for changes of dark-to-light, and a trajectographic circuit connected to a camera and a microcomputer in order to fix a particle position in Cartesian coordinates. Successive images are coded into computer memory for retrieval and analysis. M.S.K.

A82-27114 **More than meets the eye - The oil dot technique.** E. Atraghji (National Aeronautical Establishment, Ottawa, Canada). In: Flow visualization II; Proceedings of the Second International Symposium, Bochum, West Germany, September 9-12, 1980. Washington, DC, Hemisphere Publishing Corp., 1982, p. 619-628. 7 refs.

A numerical model is developed to gain quantitative data on the surface shear stress distribution on an object studied by means of the oil dot technique. Consideration is given to an idealized dot set in motion by a constant shear stress and leaving a streak which in time is described by equations of motion. Viscosity is accounted for by means of a pi theorem. Examples are provided for the flow over an ellipsoid of revolution using lamp black suspended in Blazers oil L, with simultaneous pressure measurements by Preston and pitot tubes. A second trial was performed using lamp black and glycerine on a flat glass plate in a flow of varying Mach number. A nonlinear behavior of the shear stress in relation to the streak length was observed in the first trial, and a proportionality between the length and the shear stress in the second. It is concluded that glycerine is a more suitable streak fluid than the lamp black, and that small magnetic disks can be tried with suitably magnetic bodies. M.S.K.

A82-27126 **Fibrous composites in structural design.** Edited by E. M. Lenoe, D. W. Oplinger, and J. J. Burke (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA). New York, Plenum Press, 1980. 883 p. $65.

Developments related to aircraft structures are discussed, taking into account composite aircraft structures, composite wing substructure technology on the AV-8B advanced aircraft, a preliminary design development AV-8B forward fuselage composite structure, a wing fuselage critical component development program, and the development of a preloaded hybrid advanced composite wing pivot fairing. Other topics considered are related to missile and space applications, crashworthiness, impact damage, postbuckling, dynamics response, and special design considerations. Attention is also given to laminate plate theories, edge effects, flaw growth, helicopter applications, composite joints, a reliability/durability analysis, environmental effects, the development of an advanced composite hydrofoil control flap, and advancements in composite material flywheels. G.R.

A82-27127 * **Composite aircraft structures.** L. F. Vosteen (NASA, Langley Research Center, Hampton, VA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 7-24. 6 refs.

In late 1975, the Aircraft Energy Efficiency (ACEE) program was initiated by NASA in order to accelerate the development of selected technologies which showed promise for substantial improvements in the fuel efficiency of commercial transport aircraft. A description is presented of the status of the composite structure development programs which form one of the six sections of the ACEE program. Six aircraft components are currently being developed under NASA contract by three major transport manufacturers. The components include the upper aft rudder of the Douglas DC-10, the inboard ailerons of the Lockheed L-1011, the elevators of the Boeing 727, the vertical stabilizers for the Lockheed L-1011 and Douglas DC-10, and the horizontal stabilizers of the Boeing 737. It is found that the composite components show a high potential for achieving cost comparability with the metal parts they are designed to replace. G.R.

A82-27128 **Composite wing substructure technology on the AV-8B advanced aircraft.** M. L. Huttrop (McDonnell Aircraft Co., St. Louis, MO). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 25-40.

Design improvements to the AV-8B V/STOL aircraft to increase the payload-radius capability include a new wing design. New wing design features are related to an increased aspect ratio for better cruise performance, an increased thickness ratio for lighter structure and increased fuel volume, additional store stations, maneuvering flaps with positive circulation, increased aileron and flap travel, and composite structure for reduced weight and unconstrained optimization of the aerodynamic shape of the advanced supercritical airfoil. The wing has one-piece graphite/epoxy skins and a multi-spar substructure with graphite/epoxy sinewave webs. Attention is given to a wing description, aspects of substructure design, sinewave configuration, tooling, design details, corrosion prevention, and nondestructive testing. G.R.

A82-27129 **Preliminary design development AV-8B forward fuselage composite structure.** J. C. Watson (McDonnell Aircraft Co., St. Louis, MO). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 41-61.

The AV-8B is a second generation V/STOL aircraft which derives its superior performance from selective improvements to the AV-8A. It has twice the payload radius capability of the AV-8A, improved weapon delivery accuracy, and increased operational readiness. These improvements are being validated by flight demonstrations with two YAV-8B prototype aircraft. The AV-8B combines U.S. V/STOL technology with the proven vectored thrust concept. A new, larger wing has a higher aspect ratio and a supercritical airfoil. The major structural elements of the wing and forward fuselage are of composite materials. The forward fuselage is a conventional single-seat structure with the multiframe and stringer construction. Attention is given to details concerning the composite structure, the repairability of the composite design, the influence of trade studies on the design, a comparison of weights and costs, and fuselage fabrication techniques. G.R.

A82-27130 **Wing/fuselage critical component development program.** R. W. Walter, R. R. June, J. E. Mooney, and R. A. Hamm (Boeing Co., Seattle, WA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 63-93. Contract No. F33615-77-C-5228.

The employment of advanced composites in modern high performance aircraft has been generally limited to relatively uncomplicated structure and based on substitution design or replacement approaches. The logical and orderly expansion of the use of advanced composites in more complex primary structure will result in additional cost and weight saving. Potential lower acquisition costs can be achieved due to improved low cost manufacturing approaches. The relative insensitivity of advanced composites to fatigue damage can result in longer service life and significantly lower life cycle costs. A summary is presented of the results obtained by an American aircraft manufacturer in an Air-Force sponsored Phase I study program. Attention is given to a structural configuration definition, preliminary structural design and trade studies, and aspects of structural design development. G.R.

A82-27131 **Development of a preloaded hybrid advanced composite wing pivot fairing.** D. O. Lowe, J. F. Willis, and W. L. Zirbes (Rockwell International Corp., Los Angeles, CA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 95-102.

A description is presented of the results of the advanced composite developmental work performed in support of the B-1 Bomber Wing Fairing Design Improvement Program under Air Force contract. This study was performed by an American aerospace company during the 12-month period from August 1976 to August 1977. The wing fairing system for the B-1 bomber consists of a fixed fairing for fuselage/fairing moldline transition, an aft movable fairing for nacelle-to-underwing aerodynamics, aft overwing transition panels, and the forward preloaded wing pivot fairing. Attention is given to the redesign of the preloaded pivot fairings. An advanced composite hybrid glass/epoxy design was developed which indicated a potential weight savings of 47 percent of approximately 900 pounds over the solid fiberglass baseline design used on B-1 RDT and E aircraft 1 through 4. G.R.

A82-27132 **Design concepts for composite fuselage structure.** C. R. Foreman (Vought Corp., Dallas, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 103-123.

Investigations have been conducted concerning the development of vertical lift concepts in support of the Navy's future generation of V/STOL aircraft. These aircraft will operate from ships considerably smaller and less expensive than current supercarriers. Studies to date have been directed toward two basic types of aircraft, including the subsonic ASW/AEW 'Type A' aircraft, and the Mach 2 fighter 'Type B' aircraft. Composite fuselage development work conducted during the past two years has provided valuable design information. It was found that significant weight savings for use of composite materials versus conventional metal construction in fuselage shell structure can be obtained at low loading intensities, in the minimum gage range. Low fabrication cost design concepts for large, stiffened-panel type fuselage shell structure have been generated, and preliminary testing has been conducted. G.R.

AEROELASTIC CHARACTERISTICS OF A MISTUNED BLADED-DISC ASSEMBLY Ph.D. Thesis
Robert Evans Kielb 1981 206 p
Avail: Univ. Microfilms Order No. 8129037

The aeroelastic characteristics of mistuned bladed disc assemblies are studied by analytically modeling the bladed disc and its environment and using these models to conduct parametric studies. These studies have concentrated on the effect of mistuning on the system stability and, to a lesser extent, on the aeroelastic response. Aerodynamic coupling between the blades is investigated. Each blade is modeled as a two degree of freedom oscillator in which the airfoil is permitted to have bending (plunging) and torsional (pitching) motions which are inertially coupled. The disc is focused on and a technique is presented for calculating the free vibration frequencies and mode shapes of a rotating disc with variable thickness and temperature. The resulting model is used to study the dependency of disc modal frequency on the nodal diameter of the mode. Dissert. Abstr.

TESTS AND ANALYSIS OF A VENTED D THRUST DEFLECTING NOZZLE ON A TURBOFAN ENGINE Final Report, Mar. 1980 - Mar. 1982
E. W. Rosberg Mar. 1982 78 p refs
(Contract NAS2-10564)
(NASA-CR-166279; NAS 1.26:166279; MDC-IR0280) Avail: NTIS HC A05/MF A01 CSCL 21E

The objectives were to: obtain nozzle performance characteristics in and out of ground effects; demonstrate the compatibility of the nozzle with a turbofan engine; obtain pressure and temperature distributions on the surface of the D vented nozzle; and establish a correlation of the nozzle performance between small scale and large scale models. The test nozzle was a boilerplate model of the MCAIR D vented nozzle configured for operation with a General Electric YTF-34-F5 turbofan engine. The nozzle was configured to provide: a thrust vectoring range of 0 to 115 deg; a yaw vectoring range of 0 to 10 deg; variable nozzle area control; and variable spacing between the core exit and nozzle entrance station. Compatibility between the YTF-34-T5 turbofan engine and the D vented nozzle was demonstrated. Velocity coefficients of 0.96 and greater were obtained for 90 deg of thrust vectoring. The nozzle walls remained cool during all test conditions. T.M.

PRELIMINARY INVESTIGATION OF EFFECTS OF HEAVY RAIN ON THE PERFORMANCE OF AIRCRAFT
Otto W. K. Lee Feb. 1982 16 p refs
(NASA-TM-83272; NAS 1.15:83272) Avail: NTIS HC A02/MF A01 CSCL 01C

A guideline was defined for the analysis of flight data to determine the effects of rain on the aerodynamic performance of an aircraft. It distinguishes and separates the effects of horizontal wind shears, downdrafts, gusts at the phugoid frequency, and rain based on various aerodynamic parameters. Flight data from NASA LaRC's TCV B-737 were inconclusive because precipitation rates encountered probably were not high enough. However, the guideline seemed to be valid and can be used on further flight data evaluations. Difficulties in this type of data analysis are discussed. Other indirect influences of rain on the degradation of airplane performance are also considered. Author

NASA LANGLEY LAMINAR FLOW CONTROL AIRFOIL EXPERIMENT
W. D. Harvey and J. D. Pride *In its* Laminar Flow Control Mar. 1982 p 1-42 refs

Avail: NTIS HC A07/MF A01 CSCL 01A

The design and construction of an advanced swept supercritical airfoil for commercial aircraft to be tested in a transonic wind tunnel is described. The swept LFC airfoil was designed for a given thickness ratio and lift coefficient, with emphasis placed on high critical Mach number with shock-free flow. It is compatible with satisfactory low speed and buffeting characteristics and minimizing the suction laminarization. Further emphasis was placed on achieving shock-free flow over a wide range of off-design conditions including trailing edge flap control. The requirements and design of the suction system and modifications to the Langley 8 foot transonic pressure tunnel is briefly described. Contouring of nonporous test section walls for free air simulation and flow quality improvements is included. J.D.H.

STATUS OF NASA ADVANCED LFC AIRFOIL HIGH-LIFT STUDY
Zachary T. Applin *In its* Laminar Flow Control Mar. 1982 p 43-62 refs
Avail: NTIS HC A07/MF A01 CSCL 01A

The design of a high lift system for the NASA advanced LFC airfoil designed by Pfenninger is described. The high lift system consists of both leading and trailing edge flaps. A 3 meter semispan, 1 meter chord wing model using the above airfoil and high lift system is under construction and will be tested in the NASA Langley 4 by 7 meter tunnel. This model will have two separate full span leading edge flaps (0.10c and 0.12c) and one full span trailing edge flap (0.25c). The performance of this high lift system was predicted by the NASA two dimensional viscous multicomponent airfoil program. This program was also used to predict the characteristics of the LFC airfoils developed by the Douglas Aircraft Company and Lockheed-Georgia Aircraft Company. J.D.H.

JOINT US/USSR MODE S COMPATIBILITY TEST PROGRAM, VOLUME 1 Final Report, 5 Oct. - 30 Oct. 1981

Rodney Guishard and Anatoly Bolshev Oct. 1981 36 p refs 2 Vol.

(FAA Proj. 034-241-510)

(PB82-126616; DOT/FAA-CT-82-16-Vol-1) Avail: NTIS HC A03/MF A01 CSCL 17G

The compatibility of a U.S.S.R. designed transponder with the U.S. Mode S system was investigated. A U.S. transponder was included in these tests for convenient comparison of results. Both bench tests and flight tests were conducted to ascertain compatibility to the U.S. Discrete Address Beacon System (DABS) National Standard of 1978. Radial and orbital flight profiles were used to gather statistical data to draw conclusions about the transponder's performance in conjunction with the Mode S system. Both the methods of conducting these tests and the results obtained are described. GRA

GENERIC TEST BED (GTB) AIRCRAFT Final Report, 1 May 1980 - 1 Oct. 1981

Donald R. Chislaghi, Dennis W. Jarvi, and Steven R. Markman Dec. 1981 61 p refs

(AD-A110335; ASD-TR-81-5036) Avail: NTIS HC A04/MF A01 CSCL 01/3

The Night Attack Workload Steering Group (NAWSG) was requested by HQ AFSC/SD to investigate the need for a Generic Test Bed aircraft and to identify potential candidate aircraft. The team learned a need existed for an aircraft that could perform near the night attack envelope. The aircraft is needed to test, under realistic conditions, both the avionics and their effect on pilot crew workload. The team also identified several potential candidate aircraft that had sufficient cockpit space, volume, cooling and power to permit it to support this mission. Author (GRA)

PRELIMINARY AIRWORTHINESS EVALUATION OF THE UH-1H WITH HOT METAL PLUS PLUME INFRARED SUPPRESSOR AND INFRARED JAMMER Final Report, 16 Jan. - 18 May 1981

Bartholomew D. Picasso, III, John D. Ottomeyer, Loran A. Haworth, and Richard Vincent Jun. 1981 87 p refs

(AD-A110213; USAAEFA-80-06) Avail: NTIS HC A05/MF A01 CSCL 01/2

The Preliminary Airworthiness Evaluation (PAE) of the UH-1H, with the Infrared (IR) Suppressor and AN/ALQ-144 IR Jammer installed, was conducted using a JUH-1H. The initial design cused a degradation in directional stability. The installation was redesigned to reduce the airflow disturbance over the tail rotor and vertical stabilizer. This evaluation was conducted in two phases. Phase 1 was a comparative evaluation of handling qualities of the UH-1H in both the standard and IR suppressor configurations. Phase 2 was primarily a pressure and temperature survey of the IR suppressor configuration. The handling qualities of the UH-1H helicopter were essentially unchanged by the IR suppressor and IR jammer installation tested. The tail boom surface temperatures were higher for the initial design. The metal to metal contact between the engine exhaust ejector and the IR suppressor inner core support struts,was identified. Three shortcomings were also identified. GRA

ALQ-164 POD/AV-8C ENVIRONMENTAL EVALUATION FLIGHT TEST

Lawrence J. Mertaugh 11 Dec. 1981 152 p

(AD-A110198; NATC-TM-81-109-SY) Avail: NTIS HC A08/MF A01 CSCL 01/3

This report provides the test results of a flight test program conducted to evaluate the environmental conditions to which the ALQ-164 pod is exposed when carried on the AV-8C aircraft. Descriptions are provided of the test program, test equipment, instrumentation, and methods of analysis. The test results include cooling-air mass flow and temperature, vibration levels measured on the pod structure and on the isolator mounted equipment support structure, and pod skin temperature. Test conditions include steady-state conditions throughout the available pod/aircraft flight envelope as well as various vertical takeoff and landing, short takeoff and landing and gun fire operations. OPTIMAL TERRAIN-FOLLOWING FEEDBACK CONTROL FOR ADVANCED CRUISE MISSILES Final Report

Richard F. Whitbeck and Julian Wolkovitch (Aeronautical Consultant Associates) Jan. 1982 48 p refs

(Contract N00014-79-C-0657)

(AD-A110286) Avail: NTIS HC A03/MF A01 CSCL 16/4

A cruise missile is a vehicle that spends the major portion of its flight at essentially constant altitude and speed. Some cruise missiles are flown at very low altitudes in order to avoid detection. The terrain-following capabilities of such a missile and its guidance system are of importance. It is desirable that the missile should follow closely the contour of the terrain, which may be fixed (Land) or time-varying (ocean waves). A previous study (Ref. 1) demonstrated that optimal control theory could usefully be applied to calculate the best achievable accuracy of terrain-following. Reference 1 showed that, even with an optimal guidance system, terrain-following accuracy was limited by considerations of the cruise missile's inertias, airspeed, and aerodynamic configuration. NUMERICAL AIRCRAFT DESIGN USING 3-D TRANSONIC ANALYSIS WITH OPTIMIZATION. VOLUME 1: EXECUTIVE SUMMARY Final Report, May 1978 - Sep. 1980

A. J. Srokowski, M. E. Lores, and P. Aidala (Grumman Aerospace Corp., Bethpage, N.Y.) Wright-Patterson AFB, Ohio AFWAL Aug. 1981 59 p refs 2 Vol.

(Contract F33615-78-C-3014; AF Proj. 2404)

(AD-A110035; LG81ER0107-Vol-1; AFWAL-TR-81-3091-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 20/4

A detailed summary of the work performed in the Advanced Transonic Technology (ATT) program to incorporate 3-D Transonic computational aerodynamics methods into aircraft design procedures is presented. Existing transonic analysis programs were modified for the design procedure and linked with a numerical optimization program to design wings that are in some sense optimized for a given set of design conditions. The design procedure was validated by applying it in two design case studies. The application of the design procedure in each of these case studies is described in detail. The configurations resulting from these studies were subjected to design verification wind tunnel testing. Comparisons of test data with computed results are presented. GRA

NUMERICAL AIRCRAFT DESIGN USING 3-D TRANSONIC ANALYSIS WITH OPTIMIZATION, VOLUME 2. PART 1: TRANSPORT DESIGN Final Report, May 1978 - Sep. 1980
A. J. Srokowski, M. E. Lores, R. A. Weed, and P. R. Smith Wright-Patterson AFB, Ohio AFWAL Aug. 1981 187 p refs Prepared in cooperation with Grumman Aerospace Corp., Bethpage, N.Y. 2 Vol.
(Contract F33615-78-C-3014; AF Proj. 2404)
(AD-A110231; LG81ER0107-Vol-2-Pt-1;
AFWAL-TR-81-3091-Vol-Pt-1) Avail: NTIS HC A09/MF A01 CSCL 20/4

The purpose was to develop and validate a new transonic wing design procedure using the numerical optimization technique. The new procedure was used to design both a transport and a fighter configuration. Because the missions and design requirements of a fighter and transport are so different, the design procedure was developed along parallel lines. The results of a transport design case study performed to evaluate the transonic aircraft design procedure developed as part of the Advanced Transonic Technology (ATT) program are presented. A derivative of the C141B aircraft was selected as the design configuration. The design procedure was applied to the baseline configuration and the performance of resulting configuration was then compared to the C141 aircraft. Extensive wind tunnel testing of the design configuration was performed to validate the design procedure. The results of the wind tunnel tests are correlated with computational results generated in the design process. In addition, the evolution of the design procedure and its application in the transport design case study is discussed. GRA

AFWAL-TR-81-3091-Vol-2-Pt-2) Avail: NTIS HC A04/MF A01 CSCL 20/4

The results of a fighter design case study performed to evaluate the transonic aircraft design procedure developed as part of the Advanced Transonic Technology (ATT) program are presented. The fighter design is based on the Configuration Design of Advanced Fighters program dual role configuration. Extensive wind tunnel testing of the design configuration was performed to validate the design procedure. The results of the wind tunnel tests are correlated with computational results generated in the design process. The purpose of the ATT program was to develop and validate a new transonic wing design procedure using numerical optimization. The new procedure was used to design both a transport and a fighter configuration. Because the missions and design requirements of a fighter and transport are so different, the design procedure was developed along parallel lines. This is Part 2 of a two-part volume: Part 1 details the transport development, and Part 2 describes the fighter development. There are two other volumes which make up the final report. Volume 1 is an executive summary. It highlights the information that has been presented in detail here. GRA

This document is the first part of a two part volume of detailed User's Guide for the computer programs of a new transonic wind design procedure. Part 1 presents the User's Guide for the transport design programs produced by Lockheed-Georgia Company and Part 2 presents the User's Guide for the fighter design programs. The purpose of the contract was to develop and validate a new transonic wing design procedure using the numerical optimization technique. The new procedure was used to design both a transport and a fighter configuration. Because the missions and design requirements of a fighter and transport are so different, the design procedure was developed along parallel lines. Lockheed-Georgia Co. developed the transport design procedure, and Grumman Aerospace Corp. developed the fighter design procedures. Users guides for the computer programs used in the transport design case study for the aircraft design procedure developed as part of the Advanced Transonic Technology (ATT) program are presented. These programs include two 3D transonic wing analysis codes linked to a numerical optimizing routine, a two dimensional strip boundary layer program and a wing pylon nacelle interference program. The input data required by each program is described in detail. Samples of the output from each program are presented. Author (GRA)

HELICOPTER VIBRATION CONTROL: A SURVEY
G. Reichert Ottobrunn, West Germany 1 Sep. 1980 31 p refs Presented at 6th European Rotorcraft and Powered Lift Aircraft Forum, Bristol, England, 16-19 Sep. 1980
(MBB-UD-302/80-O) Avail: NTIS HC A03/MF A01

Methods for reducing helicopter vibrations are reviewed including structural optimization of the rotor and the whole helicopter, blade and rotor pendulum absorbers, rotor isolation concepts following the antiresonance principle (nodal isolation), and active isolation devices. Vibration characteristics at various speeds and during maneuvers are summarized. The integration of vibration considerations during design and development are shown, including finite element modeling in the detail design phase. Developments in automatic harmonic blade pitch control utilizing closed loop systems are mentioned. Author (ESA)

[PNR-90066] N82-21208
Telemetry in aero engine development --- from operating engines
[PNR-90055] N82-21247

AIRCRAFT EQUIPMENT
Generic Test Bed (GTB) aircraft
[AD-A110335] N82-21176

AIRCRAFT FUEL SYSTEMS
The design, construction, and performance of composite fuselage components for the Boeing 234 helicopter
A82-27424

AIRCRAFT FUELS
The formation of benzpyrene during the combustion of aviation fuels
A82-26494
Methodology for determining fuel-combustion efficiency and the toxicity of exhaust gases
A82-26495
Full-scale flammability test data for validation of aircraft fire mathematical models
[NASA-TM-58244] N82-21166
Engines for air transport --- aircraft fuel consumption
[PNR-90066] N82-21208

AIRCRAFT HAZARDS
Lightning detection and ranging
A82-26367
Safety (aviation material)
[AD-A110361] N82-20165
Full-scale flammability test data for validation of aircraft fire mathematical models
[NASA-TM-58244] N82-21166

AIRCRAFT INDUSTRY
Future of general and commuter aviation technology and trade
[GPO-85-832] N82-20159
Industrial experience in the Anglo-French helicopter collaboration
[SNIAS-811-210-101] N82-21154
Positron annihilation --- aircraft industry applications; fault detection
[BAE-KGT-N-GEN-06996] N82-21600
The benefits of data exchange --- between airline and engine manufacturer
[PNR-90048] N82-22095

AIRCRAFT INSTRUMENTS
Radio-navigation equipment of aircraft - Devices and operation --- Russian book
A82-26500
Simple vs. sophisticated TacAir avionics. II - Soviet TacAir avionics technology
A82-28397

AIRCRAFT LANDING
The effects of weather on runway operations
A82-27050
The characteristics and detection of low level wind shear in the critical phases of flight
A82-28349
Chicago monostatic acoustic vortex sensing system. Volume 2: Decay of B-767 and DC-8 vortices
[AD-A109518] N82-20157
Rangefinder system for slant range visibility
N82-20746

AIRCRAFT MAINTENANCE
CH-46 fiberglass rotor blade repair program
A82-26384
Problems and options in advanced composite repair
A82-27145
A new resin for field repair
A82-27412
Compatibility of 350 deg curing honeycomb adhesives with phosphoric acid anodizing
A82-27418
Airline maintenance strategy
A82-27883
Airline ATE requirements
A82-27884
The modular ATE --- for cost effective maintenance of new generation avionics
A82-27886
ATE logistics in the United States Air Force
A82-27890
The United States Air Force Automated Vibration Diagnostics System /AVID/ for improved jet engine maintenance
A82-27906

AIRCRAFT MANEUVERS
Aerial combat simulation in the U.S. Air Force
A82-27920
The stability of portable bridges carried on slings beneath helicopters
[ARL/AERO-REPT-154] N82-21213

AIRCRAFT NOISE
Model helicopter rotor low frequency broadband noise
A82-25772
On the generation of side-edge flap noise
A82-26319
Large scale model measurements of airframe noise using cross-correlation techniques
A82-26946
The status of airport noise prediction, with special reference to the United Kingdom and Europe
A82-28149
The impact and future direction of aircraft noise certification
[PNR-90053] N82-21788
A preliminary comparison between the SR-3 propeller noise in flight and in a wind tunnel
[NASA-TM-82805] N82-21990
Standards in aircraft noise certification
[PNR-90052] N82-22005

AIRCRAFT PARTS
Problems and options in advanced composite repair
A82-27145
Light weight adhesive joining of composite structures
A82-27404

AIRCRAFT PERFORMANCE
Optimum three-dimensional flight of a supersonic aircraft
A82-26039
AV-8B/Harrier GR.5 - Range, payload and VSTOL
A82-26040
Yak-36 Forger - The brand X VTOL fighter
A82-26045
A310 - Europe builds on Airbus success
A82-26536
One year flight testing of the Transonic Wing
A82-26543
The effects of weather on runway operations
A82-27050
Heavy rain penalties for a flight simulator
[AIAA PAPER 82-0213] A82-27093
Advanced engine technology and its influence on aircraft performance
A82-28515
Aircraft pitch attitude as a performance parameter
A82-28519
Preliminary investigation of effects of heavy rain on the performance of aircraft
[NASA-TM-83272] N82-20145
Meteorology impact on future aircraft design
N82-21143

AIRCRAFT PRODUCTION
Sikorsky tail rotor - 1980: Advanced manufacturing and quality control techniques
A82-26390
Structural design and construction of the New Technology Wing
A82-26381
Rational production methods for the manufacture of helicopter rotor blades --- BO-105 helicopter
[MBB-UD-312/80-OE] N82-21190

AIRCRAFT PRODUCTION COSTS
A CAD approach to cost estimating composite aircraft
A82-27196
Engine industry cost considerations for emerging technologies
A82-27429
Manufacturing cost trade-studies in avionics
A82-27430

AIRCRAFT RELIABILITY
SH-60B Seahawk automatic blade fold system
A82-26397
Fracture mechanics technology applied to individual aircraft tracking --- durability and structural life estimates
A82-28637

Experimental methods for the prediction of the effect of viscosity on propeller performance [AD-A109846] N82-20472

FLOW VISUALIZATION
Quantitative interpretation of recirculated flow visualization by the analysis of video pictures A82-27109
More than meets the eye - The oil dot technique A82-27114
Vortex flow correlation --- water tunnel tests on thin slender wings [AD-A108725] N82-20468

FLUID DYNAMICS
Von Karman and VKI - The first 25 years A82-25673

FLUID FLOW
Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers A82-26176
Analytical investigation of nonrecoverable stall [NASA-TM-82792] N82-21195

FLUID MECHANICS
Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers A82-26176

FLUIDICS
Dualchannel fuel control program, phase 2 [AD-A109715] N82-20185

FLUTTER
Active flutter suppression on an F-4F aircraft [AIAA PAPER 80-0770] A82-28513
Application of the finite element method to rotary wing aeroelasticity [NASA-CR-165854] N82-20561
Pressure measurements on a wing oscillating in supercritical flow [RAE-TR-79074] N82-21163

FLUTTER ANALYSIS
Wing/control surface flutter analysis using experimentally corrected aerodynamics A82-26569

FLY BY WIRE CONTROL
The future of helicopter flight control technology A82-26821

FOLDING STRUCTURES
SH-60B Seahawk automatic blade fold system A82-26391
Design optimization of rotor systems for tilt-rotor aircraft that fold for shipboard compatibility A82-26399

FORECASTING
Operational delay day forecasts for the 20 air route traffic control centers for the year 1982 through 2011 [AD-A109844] N82-20173
Ozone and aircraft operations N82-21145

FOREIGN TRADE
Future of general and commuter aviation technology and trade [GPO-85-832] N82-20159

FORMING TECHNIQUES
Laminar flow control SPF/DB feasibility demonstration [NASA-CR-165818] N82-21532

FOURIER SERIES
The application of subsonic theoretical aerodynamics to active controls --- aircraft controls [RAE-TR-81060] N82-21217

FRACTURE MECHANICS
Introduction to the principles of fracture mechanics A82-25550
Fracture mechanics technology applied to individual aircraft tracking --- durability and structural life estimates A82-26637

FRACTURE STRENGTH
Fracture control in ballistic-damaged graphite/epoxy wing structure A82-26639

FREE FLOW
Transonic flow past thin wings A82-25995

FREE VIBRATION
Aeroelastic characteristics of a mistuned bladed-disc assembly N82-20142

FROST
Effect of heavy rain on aircraft N82-21149

FUEL COMBUSTION
The formation of benzpyrene during the combustion of aviation fuels A82-26494
Methodology for determining fuel-combustion efficiency and the toxicity of exhaust gases A82-26495

FUEL CONSUMPTION
On-board computers save fuel and help ATC A82-26046
Fuel optimal trajectory computation A82-26563
Meteorological impact on aviation fuel efficiency N82-21140
Developments to improve the noise and combustion emissions on the Fokker F28 aircraft and its Rolls-Royce RB183-555 engines. Section 1: Development of the new internal 10-Lobe mixer [PNR-90061] N82-21207
Engines for air transport --- aircraft fuel consumption [PNR-90066] N82-21208

FUEL CONTROL
Dualchannel fuel control program, phase 2 [AD-A109715] N82-20185

FUEL SYSTEMS
Dualchannel fuel control program, phase 2 [AD-A109715] N82-20185

FULL SCALE TESTS
Full scale test facilities for radomes and antenna windows A82-26467

FURNACES
Precision casting for gas turbine engines A82-28313

FUSELAGES
Preliminary design development AV-8B forward fuselage composite structure A82-27129
Design concepts for composite fuselage structure A82-27132
A crashworthiness test for composite fuselage structure A82-27139
The design, construction, and performance of composite fuselage components for the Boeing 234 helicopter A82-27424
Why twin-fuselage aircraft A82-28276
Full-scale flammability test data for validation of aircraft fire mathematical models [NASA-TM-58244] N82-21166

G

GALERKIN METHOD
Torsional vibrations of non-uniform rotating blades with attachment flexibility A82-26313

GAS FLOW
The relative motion of a particle in the case of exponential changes of the velocity of the medium A82-26479
Simulation of turbofan engine models in the Weybridge low speed wind tunnel --- gas supply control [RAE-INFORM-NOTE-46] N82-21212

GAS PRESSURE
Determination of losses in a channel with a sudden expansion behind a diffusor A82-26492

GAS TURBINE ENGINES
Requirements on modern mathematical models of gas turbine engines. I A82-26486
Application of combined balancing methods to flexible rotors of aviation gas-turbine engines A82-26491
Rub energetics of compressor blade tip seals A82-27078

Strength of the turbine components of a gas-turbine engine under complex loading and associated problems
A82-27526

Analysis of the temperature field of a baffle-cooled gas-turbine-engine blade under conjugated boundary conditions
A82-28015

The effect of temperature-time factors on the metal damage and endurance characteristics of gas-turbine-engine rotor blades
A82-28019

Precision casting for gas turbine engines
A82-28313

Heavy-duty engines analysis, study 4: A preliminary market analysis for gas-turbine applications in the farm market
[DE82-001758]
N82-20549

Cold-air performance of a 15.41-cm-tip-diameter axial-flow power turbine with variable-area stator designed for a 75-kW automotive gas turbine engine
[NASA-TM-82644]
N82-21193

Experimental investigation of turbine endwall heat transfer. Volume 1: Description of experimental hardware and test conditions
[AD-A110332]
N82-21199

Experimental investigation of turbine endwall heat transfer. Volume 2: Linear and annular cascade summary data sets
[AD-A110333]
N82-21200

Experimental investigation of turbine endwall heat transfer. Volume 3: Data base system
[AD-A110334]
N82-21201

Coatings in the aero gas turbine --- sprayed coatings
[PNR-90049]
N82-21204

Process development and evaluation of gas turbine engine components in IMI 829 --- titanium alloy
[PNR-90050]
N82-21205

The mechanical testing of compressors and turbines for aircraft gas turbine engines --- Rolls Royce engines
[PNR-90070]
N82-21211

Telemetry in aero engine development --- from operating engines
[PNR-90055]
N82-21247

GAS TURBINES

Investigation of heat transfer in the vicinity of the leading and trailing edges of a cooled nozzle blade of a low-consuming gas turbine
A82-28018

Dualchannel fuel control program, phase 2
[AD-A109715]
N82-20185

GENERAL AVIATION AIRCRAFT

Structural design and construction of the New Technology Wing
A82-26541

Experimental program for general aviation --- wing design, construction and flight testing
A82-26542

Improving the crashworthiness of general aviation aircraft by crash injury investigations
A82-28476

Simulator study of a pictorial display for general aviation instrument flight
[NASA-TP-1963]
N82-20180

NASA/Lewis Research Center Icing Research Program
N82-21148

GIMBALS

Aeroelastic analysis of the elastic gimbal rotor
[NASA-CR-166287]
N82-21157

GLASS

Effect of mechanical surface and heat treatments on erosion resistance
A82-27071

GLASS FIBER REINFORCED PLASTICS

CH-47 fiberglass rotor blade design and fabrication
A82-26397

Design and production of fiberglass helicopter rotor blades
A82-27153

Composite fasteners - A compatible joining technique for fibrous composites in structural design --- aircraft construction materials
A82-27159

GLASS FIBERS

CH-46 fiberglass rotor blade repair program
A82-26384

Operational experience with the fiberglass rotor blade
A82-26388

GLIDE PATHS

UTD terrain reflection model with application to ILS glide slope
N82-20166

GRAPHITE-EPOXY COMPOSITES

Sikorsky tail rotor - 1980: Advanced manufacturing and quality control techniques
A82-26390

Sonic fatigue testing of an advanced composite aileron
[AIAA PAPER 81-0634]
A82-26567

Fracture control in ballistic-damaged graphite/epoxy wing structure
A82-26639

Composite wing substructure technology on the AV-8B advanced aircraft
A82-27128

Design concepts for composite fuselage structure
A82-27132

Advanced composites integral structures meet the challenge of future aircraft systems
A82-27133

Continuous filament advanced composite isogrid - A promising structural concept
A82-27138

A crashworthiness test for composite fuselage structure
A82-27139

Impact resistance of graphite and hybrid configurations
A82-27141

Effects of lightning and nuclear electromagnetic pulse on an advanced composites aircraft
A82-27144

Preliminary design of an advanced composite rotor hub for the UH-60A Black Hawk
A82-27154

Evaluation of graphite/epoxy shims in a high capacity laminate helicopter bearing
A82-27155

Durability evaluation of highly stressed wing box structure
A82-27163

Growth of four flaw types in graphite/epoxy composites due to fully reversed fatigue
A82-27167

Flight service evaluation of advanced structures
A82-27402

A new resin for field repair
A82-27412

Characterization of composition variations in a structural adhesive
A82-27415

Study of noise reduction characteristics of composite fiber-reinforced panels, interior panel configurations, and the application of the tuned damper concept
[NASA-CR-168745]
N82-21999

GRAVITATIONAL EFFECTS

Study and design of high G augmentation devices for flight simulators
[AD-A109127]
N82-20195

GROUND EFFECT (COMMUNICATIONS)

Terrain reflection effects on data reception from airborne vehicles
A82-27231

GROUND HANDLING

IATA's Unit Terminal Concept
A82-27049

GROUND SUPPORT EQUIPMENT

Telemetry Computer System at Wallops Flight Center
A82-27188

Aircraft interrogation and display system: A ground support equipment for digital flight systems
[NASA-TM-81370]
N82-21175

GUIDE VANES

Sea King flight tests pitot-static probe and directional vane instrumentation
[AD-A109427]
N82-20176

YF 102 in-duct combustor noise measurements with a turbine nozzle, volume 1
[NASA-CR-165562-VOL-1]
N82-21031

YF 102 in-duct combustor noise measurements with a turbine nozzle, volume 2
[NASA-CR-165562-VOL-2]
N82-21032

SPOILERS
Experimental study of the flowfield of an airfoil with deflected spoiler
[AIAA PAPER 82-0126] A82-27086
SPRAYED COATINGS
Coatings in the aero gas turbine --- sprayed coatings
[PNR-90049] N82-21204
STABILITY DERIVATIVES
Aerodynamic characteristics and store loads of a 1/24 scale F-111 aircraft model with three external store loadings
[AD-A109445] N82-20158
STABILIZATION
Test plan for SSR --- surveillance radar for air traffic control
[AD-A109503] N82-20392
STABILIZERS (FLUID DYNAMICS)
The effect of the shape of a body on the efficiency of its utilization as a flame stabilizer
A82-26483
STANDARDIZATION
Naval Air Systems Command /NAVAIR/ ATE program - Standardized ATE for the carrier environment
A82-27892
STANDARDS
Joint US/USSR mode S compatibility test program, volume 1
[PB82-126616] N82-21173
Joint US/USSR mode S compatibility test program, volume 2
[PB82-126624] N82-21174
Standards in aircraft noise certification
[PNR-90052] N82-22005
STARTING
Conditions of pulsed starting of supersonic wind tunnel diffusors
A82-25795
STATIC AERODYNAMIC CHARACTERISTICS
Static internal performance of single expansion-ramp nozzles with thrust vectoring and reversing
[NASA-TP-1962] N82-20156
STATIC PRESSURE
An investigation of the swirl in an S-duct
A82-28318
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4 --- in a wind tunnel
[RAE-TR-80066] N82-21161
STATIC STABILITY
Aerodynamic characteristics and store loads of a 1/24 scale F-111 aircraft model with three external store loadings
[AD-A109445] N82-20158
STATIC TESTS
Static internal performance of single expansion-ramp nozzles with thrust vectoring and reversing
[NASA-TP-1962] N82-20156
Fluctuating pressures on fan blades of a turbofan engine: Static and wind-tunnel investigations
[NASA-TP-1976] N82-21037
STATISTICAL ANALYSIS
Radome rain damage - An environmental analysis technique
A82-26464
Statistical analysis methods for characterizing composite materials
A82-27162
Statistical analysis and time series modeling of air traffic operations data from flight service stations and terminal radar approach control facilities: Two case studies
[AD-A109873] N82-20172
STATOR BLADES
Effect of wakes of upstream stator blades on the rotor of an axial flow compressor
A82-26208
STATORS
Cold-air performance of a 15.41-cm-tip-diameter axial-flow power turbine with variable-area stator designed for a 75-kW automotive gas turbine engine
[NASA-TM-82644] N82-21193
Research on turbine rotor-stator aerodynamic interaction and rotor negative incidence stall
[AD-A110341] N82-21203
STEADY FLOW
Transonic flow past thin wings
A82-25995
Supercritical flow past symmetrical airfoils
A82-26130
STEELS
Effect of mechanical surface and heat treatments on erosion resistance
A82-27071
STORMS (METEOROLOGY)
Detection and tracking algorithm refinement
[AD-A109517] N82-20164
STRAIN GAGES
Evaluation of crack growth gages for service life tracking
A82-26652
STRAKES
Influence of strakes on coefficients of longitudinal stability
[MBB-FE-122/S/PUB/22] N82-21215
STREAMLINING
Self streamlining wind tunnels without computers
A82-26181
STRESS ANALYSIS
Torsional vibrations of non-uniform rotating blades with attachment flexibility
A82-26313
Prediction of cyclic growth of cracks and debonds in aluminum sheets reinforced with boron/epoxy
A82-27151
Problems in the automation of the thermal-stress analysis of flight vehicles
A82-27509
Elastic-plastic finite-element analyses of thermally cycled double-edge wedge specimens
[NASA-TP-1973] N82-20566
Approach to the fatigue analysis of vertical-axis wind-turbine blades
[DE82-003193] N82-20573
STRESS CONCENTRATION
More than meets the eye - The oil dot technique
A82-27114
STRESS-STRAIN RELATIONSHIPS
Elastic-plastic finite-element analyses of thermally cycled double-edge wedge specimens
[NASA-TP-1973] N82-20566
STRUCTURAL ANALYSIS
Investigations of helicopter structural dynamics and a comparison with ground vibration tests --- using nastran
[MBB-UD-303/80-O] N82-21186
STRUCTURAL DESIGN
Structural design and construction of the New Technology Wing
A82-26541
One year flight testing of the Transonic Wing
A82-26543
Fibrous composites in structural design --- Book
A82-27126
Composite wing substructure technology on the AV-8B advanced aircraft
A82-27128
Composite fasteners - A compatible joining technique for fibrous composites in structural design --- aircraft construction materials
A82-27159
Damage tolerance and durability design of composite structures for commercial aircraft
A82-27403
STRUCTURAL DESIGN CRITERIA
Composite aircraft structures
A82-27127
Preliminary design development AV-8B forward fuselage composite structure
A82-27129
Wing/fuselage critical component development program
A82-27130
Design concepts for composite fuselage structure
A82-27132
Continuous filament advanced composite isogrid - A promising structural concept
A82-27138
Statistical analysis methods for characterizing composite materials
A82-27162

STRUCTURAL RELIABILITY
Fracture mechanics technology applied to individual aircraft tracking --- durability and structural life estimates A82-26637
Statistical analysis methods for characterizing composite materials A82-27162
Durability evaluation of highly stressed wing box structure A82-27163

STRUCTURAL VIBRATION
Vibration of structures excited acoustically N82-20343
Reduction of structural vibration by a dynamic absorber --- helicopter cabins [RAE-TM-AERO-1881] N82-21190

STRUCTURAL WEIGHT
Some thoughts on design optimization of transport helicopters A82-25771

SUBSONIC AIRCRAFT
Effects of filler materials upon radome rain erosion performance at subsonic conditions A82-26462

SUBSONIC FLOW
An investigation of the swirl in an S-duct A82-28318
Acta Aeronautica et Astronautica Sinica [AD-A110282] N82-21153
The application of subsonic theoretical aerodynamics to active controls --- aircraft controls [RAE-TR-81060] N82-21217

SUBSONIC FLUTTER
Aeroelasticity of compressor blades - Subsonic stall flutter A82-26993

SUBSONIC WIND TUNNELS
Self streamlining wind tunnels without computers A82-26181
Experimental study of the flowfield of an airfoil with deflected spoiler [AIAA PAPER 82-0126] A82-27086
Sonic wind tunnel of the Institute of Fluid Mechanics of Lille [NASA-TM-76687] N82-20192

SUCTION
NASA Langley laminar flow control airfoil experiment N82-20150
Stability of boundary layers with porous suction strips: Experiment and theory N82-20152

SUPERCHARGERS
Preliminary results on performance testing of a turbocharged rotary combustion engine [NASA-TM-82772] N82-21194

SUPERCRITICAL FLOW
Supercritical flow past symmetrical airfoils A82-26130
Pressure measurements on a wing oscillating in supercritical flow [RAE-TR-79074] N82-21163

SUPERCRITICAL WINGS
A310 - Europe builds on Airbus success A82-26536
NASA Langley laminar flow control airfoil experiment N82-20150

SUPERHIGH FREQUENCIES
Small EHF/SHF airborne SATCOM terminal A82-27209

SUPERPLASTICITY
SPF/DB titanium concepts for structural efficiency foi HC N82-20154
SPF/DB titanium LFC porous panel concept N82-20155

SUPERSONIC AIRCRAFT
Optimum three-dimensional flight of a supersonic aircraft A82-26039
Mach 2.0 rotating arm rain erosion test apparatus A82-26461

SUPERSONIC DIFFUSERS
Conditions of pulsed starting of supersonic wind tunnel diffusers A82-25795

SUPERSONIC WIND TUNNELS
Sonic wind tunnel of the Institute of Fluid Mechanics of Lille [NASA-TM-76687] N82-20192

SURFACE DEFECTS
Positron annihilation --- aircraft industry applications; fault detection [BAE-KGT-N-GEN-0099[illegible]] N82-21600

SURFACE FINISHING
Effect of mechanical surface and heat treatments on erosion resistance A82-27071
Correlation of surface characterization of phosphoric acid anodize oxide with physical properties of bonded specimens A82-27437

SURFACE ROUGHNESS EFFECTS
Heavy rain penalties for a flight simulator [AIAA PAPER 82-0213] A82-27093

SURFACE TO AIR MISSILES
Duplication of radome aerodynamic heating using the Central Receiver Test Facility solar furnace A82-26468

SURVEILLANCE RADAR
Test plan for SSR --- surveillance radar for air traffic control [AD-A109503] N82-20392

SWEEPBACK
A summary of experimental data on wing characteristics at transonic speeds [RAE-TR-AERO-1953-S.D.-77] N82-21155

SWEPT FORWARD WINGS
Numerical aircraft design using 3-D transonic analysis with optimization, volume 3. Part 1: User's guide to transport design computer programs [AD-A110232] N82-21163

SWEPT WINGS
A310 - Europe builds on Airbus success A82-26536
NASA Langley laminar flow control airfoil experiment N82-20150
A summary of experimental data on wing characteristics at transonic speeds [RAE-TR-AERO-1953-S.D.-77] N82-21155

SWEPTBACK WINGS
Helicopter rotor performance improvement by utilization of swept back parabolic blade tip A82-26298

SWIRLING
An investigation of the swirl in an S-duct A82-28318

SYMMETRICAL BODIES
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4 --- in a wind tunnel [RAE-TR-80066] N82-21161

SYSTEM EFFECTIVENESS
The United States Air Force Automated Vibration Diagnostics System /AVID/ for improved jet engine maintenance A82-27904

SYSTEM FAILURES
Real-time failure detection of aircraft engine output sensors A82-28403

SYSTEMS ENGINEERING
Lightning detection and ranging A82-26367
Design of higher harmonic control for the ABC A82-26380
The role of modern control theory in the design of controls for aircraft turbine engines [AIAA PAPER 82-0320] A82-26526
NOTAR A82-26822

SYSTEMS MANAGEMENT
Preliminary functional description of integrated flow management --- for air traffic control systems [AD-A109909] N82-21171

SYSTEMS SIMULATION
Automated radome performance evaluation in the Radio Frequency Simulation System /RFSS/ facility at MICOM A82-26471

Dynamic inflow is found to appreciably decrease the damping of body modes, although it increases the damping of the lag regressing mode. The effect can be approximately treated in most cases by the much simpler method of equivalent Lock number and drag coefficient. C.D.

A82-25794 † **Suppression of self-oscillations in open wind tunnels (Podavlenie avtokolebanii v aerodinamicheskikh trubakh s otkrytoi rabochei chast'iu).** M. Iu. Boiarchikova, E. V. Vlasov, A. S. Ginevskii, and A. V. Zosimov. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* Jan.-Feb. 1982, p. 126-132. In Russian.

A method of self-oscillation suppression for open wind tunnels is described which is based on the reduction of turbulence in subsonic jets by high-frequency acoustic irradiation. It is shown that regular low-frequency oscillations with characteristic Strouhal numbers Sh = fd/V = 0.2-0.7 (where d is the nozzle diameter, V is the flow velocity on the nozzle section, and f is the characteristic frequency of oscillations in the jet or the frequency of acoustic irradiation) can be significantly reduced by the action on the jet of high-frequency acoustic oscillations, whose characteristic frequency corresponds to Strouhal numbers of 2-5. B.J.

A82-25795 † **Conditions of pulsed starting of supersonic wind tunnel diffusors (Usloviia impul'snogo zapuska sverkhzvukovykh diffuzorov aerodinamicheskikh trub).** V. L. Grigorenko. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* Jan.-Feb. 1982, p. 133-141. 14 refs. In Russian.

A quasi-one-dimensional approach in the framework of an ideal gas is used to study the pulsed starting of nonregulated supersonic wind tunnel diffusors. Relations for determining the optimal pulsed-starting conditions are obtained on the basis of (1) the application of the Chisnell hypothesis to a reversed shock wave propagating along a nonuniform flow; (2) allowance for the interaction of this wave with disturbances reflected from the diffusor; and (3) the assumption of quasi-steady flow at the concluding stage. The starting limit determined in this manner agrees well with numerical calculations. B.J.

A82-25798 † **Allowance for flow nonuniformity in the minimum section in the optimal contouring of the expanding part of a nozzle (Ob uchete neravnomernosti potoka v minimal'nom sechenii pri optimal'nom profilirovanii rasshiriaiushcheisia chasti sopla).** A. N. Kraiko and N. I. Tilliaeva. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* Jan.-Feb. 1982, p. 184-186. 8 refs. In Russian.

The paper examines the problem of taking into account the actual nonuniform distributions of flow parameters in the minimum section of a Laval nozzle in the maximum-thrust design of its supersonic part for fixed counterpressure and maximum dimensions. Direct calculations show that the replacement of nonuniform distributions by uniform ones, i.e., the use of the plane transition surface assumption (the straight sonic line), produces contours which realize a thrust that is only hundredths of a percent less than the thrust of nozzles contoured for a curved sonic line. B.J.

A82-25874 **The bomber that radar cannot see.** B. Sweetman. *New Scientist,* vol. 93, Mar. 4, 1982, p. 565-568.

The evolution, design features, materials, and missions of the Stealth bomber under development are outlined. The idea of planes invisible to radar originated in the late 1940's with observations that certain aircraft configurations have less discernable radar images than others. High speed Soviet aircraft have tended to negate the use of low-flying, subsonic attack bombers, and the advent of carbon composite materials which absorb radio waves encouraged the creation of aircraft smaller than previous bombers, which can fly at any altitude and require minimum power for ECM because of a low radar profile. Advanced testing is currently under way at the skunk works, with concurrent Stealth technology runs at the perimeters of Soviet radar defenses to ascertain the EW configurations facing the Stealth. M.S.K.

A82-25923 # **A generalized Hill's method for the stability analysis of parametrically excited dynamic systems.** S. T. Noah and G. R. Hopkins (Texas A & M University, College Station, TX). *ASME, Transactions, Journal of Applied Mechanics,* vol. 49, Mar. 1982, p. 217-223. 40 refs.

In the analysis of various dynamical systems, representation of the motion involved frequently leads to a system of second-order linear differential equations with periodic coefficients. Examples include rotors subjected to pulsating torque, the aeroelastic stability of helicopter blades, missiles subjected to pulsating thrusts, and the attitude stability of spinning satellites. The methods available in cases in which the assumption of small variations in the amplitude of the periodic coefficients cannot be justified are essentially based on Floquet's work (1883). Hill utilized Floquet's solution to show that the stability of a second-order differential equation with periodic coefficients could be determined from a single transcendental equation. In the present study, the stability of the null solution for a general coupled system of linear ordinary equations with periodic coefficients is considered. G.R.

A82-25971 † **Inverse heat-transfer problems - Domains of application in the design and testing of technical systems (Obratnye zadachi teploobmena - Oblasti primeneniia pri proektirovanii i ispytaniiakh tekhnicheskikh ob'ektov).** V. P. Mishin and O. M. Alifanov. *Inzhenerno-Fizicheskii Zhurnal,* vol. 42, Feb. 1982, p. 181-192. 39 refs. In Russian.

The application of inverse heat-transfer methods to the design and testing of spacecraft systems is considered. Attention is given to the use of these methods for the development of mathematical thermal models, the design of thermally stressed structures, and the carrying out of model, bench, and flight tests. The planning of thermophysical experiments, with the aim of improving the efficiency of the testing of spacecraft systems, is discussed. B.J.

A82-25995 **Transonic flow past thin wings.** P. Niyogi (Indian Institute of Technology, Kharagpur, India). *Indian Academy of Sciences, Proceedings (Engineering Sciences),* vol. 4, Sept. 1981, p. 347-361. 23 refs.

This paper is devoted to a discussion of steady inviscid transonic flow past thin wings, with subsonic free-stream Mach number of less than 1, by the integral equation method. The integral equation formulation is developed for a thin unsymmetric wing at small incidence. A simple approximate analytical solution is presented for shock-free supercritical flow past a thin symmetric wing at zero incidence. The direct iteration scheme of Niyogi and Chakraborty is then extended to the three-dimensional zero incidence case, which may be used to obtain more accurate solutions for shock-free flows as well as for flows with shocks. The question of the existence and the uniqueness of a solution is studied by means of the Banach contraction mapping principle which establishes the condition of convergence of the direct iteration scheme. A82-26025 **Materials and aeronautics.** J. Charnley (Ministry of Defence, London, England). *Aerospace* (UK), vol. 9, Feb. 1982, p. 16-23. 13 refs.

For airframe structural materials there are four essential requirements: low density, high strength, high stiffness, and good corrosion resistance. Aluminum alloys are generally used since they provide high fatigue resistance and tensile strength, are cheap and less susceptible to corrosion than steel. Plastic reinforced with glass or carbon fiber finds use in helicopter blades and airframes. Engines and turbine materials require high-temperature materials and techniques such as single-crystal fabrication. Titanium and nickel alloys are standard in compressor turbine disks. Silicon is used for integrated circuits; piezoelectric materials like quartz or lithium niobate are used in surface acoustic wave devices. Cadmium mercury telluride is a sensitive infrared detector, while yttrium aluminum garnet is useful in laser range finders and target markers. Electroluminescent and liquid crystal displays use polycrystalline powders or thin films of zinc sulfide or organic materials. C.D.

A82-26039 **Optimum three-dimensional flight of a supersonic aircraft.** C.-F. Lin (Applied Dynamics International, Ann Arbor, MI). *Applied Mathematical Modelling,* vol. 6, Apr. 1982, p. 124-129.

Optimum three-dimensional flight of supersonic aircraft is considered, particularly the minimization of flight time, which is important in the climbing and turning performance of a supersonic fighter. General properties of optimum three-dimensional flight are presented, and the maximum principle is used. Optimal control is obtained by a geometrical method using the domain of manoeuverability. (Author)

A82-26044 **AV-8B/Harrier GR.5 - Range, payload and VSTOL.** M. Lambert. *Interavia*, Mar. 1982, p. 224-227.

Harrier II is a compact, relatively lightweight day-and-night fair weather attack aircraft with sufficient maneuverability to escape from existing and expected Soviet interceptors. It is basically subsonic and not fitted with radar, but can push past Mach 1 in a shallow dive even with a large load of external stores. The sustained turn performance is stated to be better than 5 G at 5,000 ft. In a short take-off it can get airborne in 1000 ft. at 28,750 lb carrying more than 5000 lb of internal fuel and 16 Mk 82 bombs, giving a combat radius of 156 nmi. New digital avionics as well as available equipment give Harrier a precise and powerful attack capability. These include the standard US Navy AYK-14 mission computer, the ASN-130 one-box inertial navigator, the Smiths single-color head-up display, a digital air data computer and a radar altimeter. All are interconnected through the standard 1553A multiple digital data bus. Weapons systems include an angle-rate bombing system. C.D.

A82-26045 **Yak-36 Forger - The brand X VTOL fighter.** G. Lafon. *Interavia*, Mar. 1982, p. 228-230.

The design of the Forger, the Soviet Union's first VTOL fighter, presents an enigma. Its wing, with 42 deg sweep on the leading edge and a thickness/chord ratio of five or six percent, is inherently capable of transonic flight, yet all three aerodynamic control surfaces incorporate set-back hinges and trailing edge tabs, clear evidence that the controls are manually operated rather than powered. Manual controls are unsuitable for transonic flight. Forger's poor standard of combat performance is evident in its estimated sustained thrust-limited turn rate of 10 deg/sec at sea level and its maximum specific excess power of 500 ft/sec. A serious limitation on Forger's operational capability is that for any takeoff, the carrier has to steam, albeit slowly, in a direction which generates a light relative wind along the axis of the angled deck. It is concluded that, in spite of Forger's advanced technology for jet-borne flight and thrust management system, it must be employed to guard the Soviet fleets primarily against enemy maritime reconnaissance aircraft. C.D.

A82-26046 **On-board computers save fuel and help ATC.** C. Bulloch. *Interavia*, Mar. 1982, p. 251, 252.

Since 1975, NASA's Langley Research Center, in cooperation with the FAA, has pursued the Terminal Configured Vehicle program, which is concerned with the control and comportment of aircraft in the destination terminal area, from top-of-descent point or later to the conclusion of the landing roll. The program could, through improved airspace utilization, effect a 20 percent reduction in typical short/medium haul block time, which would translate into a 13 percent reduction in direct operating costs. The program concentrates on the cockpit, running experiments in a specially adapted Boeing 737 and Lockheed TriStar L-1011. TCV program experiments at Denver and Dallas-Fort Worth have shown that flight crews backed by automated on-board systems can perform more efficiently in the descent phase from cruise to the pre-approach metering fix point than they could under ATC guidance. Other on-board automation systems concepts are 'distributed control' and 'flow control'. C.D.

A82-26098 **Aerodynamics - Retrospect and prospect /The 21st Lanchester Memorial Lecture/.** E. W. E. Rogers (Royal Aircraft Establishment, Farnborough, Hants., England). *Aeronautical Journal*, vol. 86, Feb. 1982, p. 43-67. 103 refs.

The history of aerodynamics theory is reviewed, beginning from Newton's formulation for the force of a stream on an inclined plane to the present, and future directions for aerodynamics are indicated. The development of the Bernoulli theorem and the Navier-Stokes equation are considered, along with the inclusion of viscid and inviscid flows and Reynolds and Prandtl numbers for flow calculations. Drag and vortices were discovered, together with flow separation, and aerodynamics test facilities were constructed in the 19th century. The work of Lanchester is prominently featured, particularly for the criteria of stable flight. Work in the U.K. in the interval 1910-1945 is outlined. The advent of computers permitted transonic flows to be modeled and aided designers, and future activities are foreseen to concentrate on airframe efficiency, control, maneuvering, and comprise studies in aerodynamics, unsteady aerodynamics, flight dynamics, and rotorcraft aerodynamics. M.S.K.

A82-26121 **Advanced display-control concepts for power plant operation.** D. L. Parks (Boeing Co., Seattle, WA). *(Electric Power Research Institute, U.S. Department of Energy, and IEEE, Symposium on Nuclear Power Systems, 13th, San Francisco, CA, Oct. 21-23, 1981.) IEEE Transactions on Nuclear Science,* vol. NS-28, Feb. 1982, p. 945-951.

This paper illustrates some of the concepts being developed for aerospace systems that are being applied in commercial airplanes and could transfer to nuclear control room applications. The same hardware and software capabilities could be tailored to develop display-control features for nuclear operations. Electronic systems permit integrated formatting to avoid mental syntheses of data from several instruments; they allow the use of multifunction, time-shared displays rather than dedicated ones. Displays can be high or low resolution as conditions require, and messages should be short and readily interpretable regardless of software coding convenience. Multifunction display and switching provide a considerable increase in flexibility. Switch matrices can themselves be mini-displays and appropriate software can make the display 'smart'. Color coding and directional arrows can be used when an emergency requires instant action. Research is ongoing to make use of the voice as a switching method. It is possible to design a simplified monitoring-control display that incorporates multiple systems and parameters. C.D.

A82-26130 **Supercritical flow past symmetrical airfoils.** K.-M. Li and M. Holt (California, University, Berkeley, CA). *Journal of Fluid Mechanics*, vol. 114, Jan. 1982, p. 399-418. 27 refs. Grant No. AF-AFOSR-80-0230.

A numerical method is developed for computing steady supercritical flow about an ellipse at zero angle of attack. The flow is assumed to be two-dimensional, inviscid, isentropic and irrotational. The free-stream Mach number lies in the high subsonic range so that a shock wave occurs locally near the body. The full potential equations are solved by Telenin's method and the 'method of lines'. Smooth interpolating functions are assumed for the unknown flow variables in selected co-ordinate directions. The resulting set of ordinary differential equations is then integrated away from or along the body depending upon whether the flow is smooth or discontinuous. Jump conditions of the governing equations are applied across the shock wave so that it is perfectly sharp. A doublet solution for flow past a closed body is used as the far-field boundary condition. Supercritical flow calculations have been performed for ellipses with thickness ratio of 0.2 and 0.4 at various free-stream Mach numbers. The present results are compared with the shock-capturing method, and good agreement is obtained. (Author)

A82-26176 **Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers.** Barton, Australia, Institution of Engineers (National Conference Publication, No. 80/4), 1981. 590 p.

A review is provided of research and developments in hydraulics in Australasia during the past decade, and aspects of prospecting for wind energy are explored. Power generation from the East Australian current by use of arrays of submerged Darrieus vertical axis turbines is considered along with normal stress measurements for viscoelastic liquids using real time holographic interferometry of the Weissenberg effect, admissibility requirements and the least squares finite element solution for potential flow, two-dimensional solid blockage in a slotted wall wind tunnel, and the dynamic behavior of propeller anemometers. Attention is given to the potential flow signature of a turbulent spot, topographic forcing in nonlinear and linear barotropic models, flow control by secondary injection, friction factors of aqueous electrolyte solutions in pipe flow, the vortex shedding process behind a circular cylinder, and the use of the method of lines for choking flow in a nozzle. G.R.

A82-26181 # **Self streamlining wind tunnels without computers.** N. Pollock (Department of Defence, Aeronautical Research

A82-27133 **Advanced composites integral structures meet the challenge of future aircraft systems.** L. M. Lackman, W. L. O'Brien, and M. S. Loyd (Rockwell International Corp., Los Angeles, CA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 125-144.

In connection with economic considerations, current planning is based, both in the military and in commercial operations, on much longer spans of usage between major new system acquisitions. The continuing development of advanced structural airframe technology is required in order to implement new structural concepts which are superior in cost/weight performance to more conventional structure. These efforts have led logically to the use of advanced composite structural/material concepts. Attention is given to future fighter technology, concepts of advanced integral primary composite structure, aspects of composite material selection, a wing configuration selection study, a substructure-to-cover study, questions of tooling and manufacturing process development, and a test program. G.R.

A82-27138 **Continuous filament advanced composite isogrid - A promising structural concept.** L. W. Rehfield, R. B. Deo (Georgia Institute of Technology, Atlanta, GA), and G. D. Renieri (McDonnell Douglas Astronautics Co., St. Louis, MO). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 215-239. 9 refs. Contract No. F49620-77-C-0077.

It is pointed out that major airframe components are normally plate or shell type structures. Efficiency considerations dictate that the components be stiffened or semimonocoque in construction. The usual approach used to stiffen the components involves the employment of longitudinal stringers and frames or ribs which are orthogonal to the stringers. An alternative approach to stiffening is based on isogrid, which is a concept that employs a repetitive equilateral triangular pattern of stiffening ribs. The name 'isogrid' refers to the fact that the triangular grid behaves in a gross sense as an isotropic material. Unlike orthogonal stiffener grids, isogrid is a stable configuration and may be used with or without attached skin. Attention is given to continuous filament advanced composite isogrid, aspects of material selection, design contraints, and design analysis methodology. G.R.

A82-27139 **A crashworthiness test for composite fuselage structure.** R. L. Foye (U.S. Army, Research and Technology Laboratories, Moffett Field, CA), C. W. Swindlehurst (Martin Marietta Aerospace, Baltimore, MD), and W. T. Hodges (U.S. Army, Structures Laboratory, Hampton, VA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 241-257.

Crashworthiness or crash survival has many aspects, including fuel containment, seat design, landing gear design, flammability, smoke toxicity, flotation equipment, design criteria, and crew escape systems. The present investigation is concerned with the capacity of the fuselage structure to crush near the point of impact, thereby dissipating kinetic energy of the vehicle. Attention is given to the test specimens, the test procedure, and the results of a number of crushing tests of various composite and aluminum structural concepts. Skin/stringer tests for lightly loaded construction show conclusively that, unless energy absorption requirements are a design consideration, conventional sheet/stringer aluminum construction will be superior to composite sheet/stringer construction with regard to compressive energy absorption capacity. G.R.

A82-27141 **Impact resistance of graphite and hybrid configurations.** J. D. Labor and N. M. Bhatia (Northrop Corp., Aircraft Div., Hawthorne, CA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 293-312. 5 refs. Contracts No. F33615-76-C-3142; No. N62269-77-C-0401.

Impact damage in the case of composite materials does not currently involve safety-of-flight concerns for most applications. However, to prevent excessive inspection and repair actions, it is important to consider the effects of impact damage. The present investigation is concerned with low velocity impact studies which were conducted with the aid of instrumented impactors to obtain the force and energy values resulting from the impact. Several geometric configuration variables have been studied, including panel size, impact location, size and shape of the impactor, panel thickness, type of edge supports, and variations in the mass and velocity of the impactor. A separate series of tests was conducted on 1/2-inch thick monolithic panels which are typical of wing structures. Alternate materials were investigated including added plies of more ductile materials and replacement of basic graphite/epoxy tape prepreg with various woven material materials. G.R.

A82-27144 **Effects of lightning and nuclear electromagnetic pulse on an advanced composites aircraft.** V. Volpe and R. Carri (Grumman Aerospace Corp., Bethpage, NY). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 341-357. 11 refs. Contract No. F33615-77-C-5169.

Tests with a 1/2 scale model of the Advanced Design Composite Aircraft (ADCA) made of graphite/epoxy for the effects of lightning strikes and the development of a mathematical model to define the internal and external coupling for nuclear and EM pulses are reported. The lightning strike portion of the trails determined the attachment points, their distribution, and the frequency of occurrence. Features of the test model are outlined, along with trial procedures which included directions of the emitting electrodes to simulate yaw, pitch, and roll. Each extremity drew an equal number of strikes, and some degradation of the composite structure was observed at locations of multiple strikes. Nuclear EM pulses were examined and it was found that external coupling is concerned only with composite conductivities parallel to the surface, the aircraft is an infinite conductor, and charge and current densities were quantified and are provided. M.S.K.

A82-27145 **Problems and options in advanced composite repair.** S. H. Myhre and R. W. Kiger (Northrop Corp., Aircraft Div., Hawthorne, CA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 359-380. 9 refs. Contract No. F33615-76-C-3017.

The development of composite repair criteria and procedures for aircraft component are reported. The repairs are required to last twice the design life of the aircraft, match the ultimate strength capability, maintain the aerodynamic performance levels, and be enacted at a reasonable cost. The use of portable heating equipment has proven feasible, and repair tests on honeycomb panels accessible on both sides, on one side, a 50-ply laminate damaged 21 plies deep, and a 50-ply laminate accessible on both sides are reviewed. The failure loads, strains, and failure modes of the repaired panels are provided to demonstrate the possibility of returning a damaged composite to full strength. Specific recommendations are offered for patch material and joining, patch configurations, scarf lengths, hole edge peeling, incipient compression failure, wet laminate repair, thick laminate repair, sandwich panel repair, and blind side repair. M.S.K.

A82-27146 **A CAD approach to cost estimating composite aircraft.** R. A. Camin (General Dynamics Corp., Fort Worth, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 381-398. 8 refs.

The current state-of-the-art in aircraft cost estimating centers around vast collections of historical cost data. Probably the greatest deficiency of the current procedure is related to the absence of historical data for new technologies. An American aerospace company has developed a new approach with regard to cost estimation in the case of composite structures. The approach makes extensive use of a data base management system tailored to aircraft design and manufacturing, and interactive graphics techniques. Best described as a deterministic computer-aided design tool, STEP (Structural Technology Evaluation Program) is designed to capitalize on currently available data. Yet it remains sufficiently flexible to accept new data as it becomes available. A detailed description is presented of the methodology STEP uses during each phase of its operation. G.R.

A82-27151 **Prediction of cyclic growth of cracks and debonds in aluminum sheets reinforced with boron/epoxy.** G. L. Roderick (U.S. Army, Structures Laboratory, Hampton, VA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 467-481. 7 refs.

An analysis was developed to predict the cyclic growth of cracks and debonds in cracked metal sheets reinforced with uncracked composite sheets. Inplane and interlaminar stresses, the stress intensity at the crack tip, and the strain-energy-release rate at the

debond front were calculated with complex-variable Green's functions. An incremental analysis was developed that used the stress intensity to predict crack growth and the strain-energy-release rate to predict debond growth. To evaluate this analysis, fatigue tests were conducted on two panels having different thicknesses; each panel consisted of a cracked aluminum sheet bonded to an uncracked boron/epoxy sheet. For both panels, the predicted crack growths agreed with experimental values. In one panel, a significant debond occurred and was predicted by the analysis. In the other panel, the debond was very localized and somewhat smaller than predicted.
C.D.

A82-27152 **Application of advanced composite materials to helicopter airframe structures.** M. J. Rich (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 483-496. 8 refs.

Under a NASA contract an analytical assessment was made as to the effectiveness of a general application of advanced composites for helicopter airframes. The result of the study concluded that a light gage diagonal tension skin integrated with foam stabilized stringers/frames could result in appreciable weight savings and reduce life cycle costs. The study also indicated that reduced weight/cost might be achieved if a single co-cure could be used and if all Kevlar skins were substituted for graphite/Kevlar in the original design concept. A program initiated under another NASA contract is concerned with the design, the fabrication, and testing of helicopter advanced composite structures. A review is conducted of the progress made in connection with both NASA contracts. G.R.

A82-27153 **Design and production of fiberglass helicopter rotor blades.** C. E. Covington and P. S. Baumgardner (Bell Helicopter Textron, Fort Worth, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 497-513.

A prototype blade program to explore the potential of composite materials for rotor blades and to establish the necessary design and manufacturing technology for their economical production was conducted. The blade featured spar caps of spanwise oriented unidirectional glass. The fabrication and flight tests are described; results were excellent, the only drawbacks being the low amount of machine-laid structure and the low ballistic damage tolerance. The actual production program is then described, including the tooling, equipment (production orbital pin winding machine, production tube winding machine, compactor, integrally heated blade bonding press), winding techniques, material form, assembly techniques, quality control, qualification, flight, and fatigue tests, fail safety demonstration, environmental, ballistic survivability, and lightning tests. After completion of one-half of qualification testing, an FAA type certificate has been awarded. The blade will have at least a 10,000 hour life. C.D.

A82-27154 **Preliminary design of an advanced composite rotor hub for the UH-60A Black Hawk.** E. F. Olster (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) and H. K. Reddick, Jr. (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 515-526. 9 refs. Army-supported research.

A program has been conducted to develop a preliminary design of a composite main rotor hub for the UH-60A Black Hawk helicopter. Graphite/epoxy was the chosen material because of its damage tolerance characteristics, and bolted joints for ballistic safety. A trade-off analysis was made consisting of three candidate hub concepts. The third concept, a configuration consisting of two horizontal flat plates connected by four filament-wound tubes housing elastomeric bearings, was selected for more in-depth design and analysis. Tests done were structural analysis, ballistic vulnerability analysis, damage tolerance assessment, reliability and maintainability assessment, cost assessment, lightning protection assessment, and radar cross section assessment. The damage tolerance of the composite hub was equal to metal for low energy impact damage but not quite as good for high impact, although it met the objectives. Reliability for the composite hub was superior to that of the metal hub. C.D.

A82-27155 **Evaluation of graphite/epoxy shims in a high capacity laminate helicopter bearing.** R. H. Finney (Lord Kinematics, Erie, PA) and S. C. Aker (Bell Helicopter Textron, Fort Worth, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 527-541.

A program undertaken to incorporate graphite/epoxy shims in a high-capacity elastomeric radial-journal bearing is discussed. The prime objective is to develop a method of reducing the weight in the helicopter dynamic system. Two different winding patterns are evaluated for the concentric tubular shims: + or - 45 deg, + or - 45 deg, + or - 45 deg, + or - 90 deg. The testing consists of ultimate torsion, ultimate axial and fatigue testing at accelerated loads and motions. The potential hysteresis heating of the elastomer is monitored with thermocouples on the shims and is found not to be a problem. The results of the fatigue tests are compared with previous test results on steel shim and aluminum shim specimens. The life of the bearing is found to be less dependent on the shim material than on the elastomer design and fabrication techniques. C.R.

A82-27156 **Mechanically-fastened joints for advanced composites - Phenomenological considerations and simple analyses.** L. J. Hart-Smith (Douglas Aircraft Co., Long Beach, CA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 543-574. 18 refs.

Various factors affecting the strength of bolted or riveted joints in advanced composites are discussed qualitatively. The mechanisms associated with each type of failure - tension, bearing, shearout, cleavage, and pull-through - are explained. The work is based mainly on experimental observations from which conclusions are drawn to integrate the study. A simple theory to explain the elastic stress concentrations at loaded bolt holes (in terms of the various geometric parameters) is deduced from experimental and analytical evidence for isotropic materials. Further tests on composite materials are used in deducing correlation factors which relate this theory to the limited, but significant, stress concentration relief observed before failure. C.R.

A82-27158 **Sensitivity of bonded and bolted joints in composites to load/environmental spectrum variations.** G. C. Grimes, L. L. Jeans, and E. Demuts. In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 619-644. 12 refs. Contract No. F33615-75-C-5236.

Results obtained after three years of a five-year research program are summarized. Most of the standard-design bolted joint testing is complete, but this is true of only 50% of the bonded joint testing. The load and environmental spectrum definitions are discussed here, along with the sensitivities observed to date. Areas where problems remain and where significant strides have been made are named, among them test machine development, materials and processes, quality assurance, experimental procedures, and environmental conditioning. Quality level variation is found to have a substantial effect on the test data variations, in some cases overshadowing the load and environmental sensitivity effects. It is reported that the testing of 20 replicate bonded joint specimens, simultaneously, proved to be a problem that was solved by changing the test fixture design. Sensitivity of the bolted joints to load and environmental spectral variations is found to be less than that of the bonded joints. C.R.

A82-27159 **Composite fasteners - A compatible joining technique for fibrous composites in structural design.** C. Tanis (USAF, Materials Laboratory, Wright-Patterson AFB, OH) and M. Poulios, Jr. (Vought Corp., Dallas, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 645-657. Contract No. F33615-77-C-5060.

A composite fastener program at the Air Force Materials Laboratory to establish and demonstrate a production method for fabricating non-corrosive composite fasteners is presented. The fasteners are suitable for fastening composite-to-composite structures, as well as metal-to-metal structures, and should be cost competitive and reduce overall aircraft weight as compared to metal fasteners. Fastener forming equipment is presented, and applications for helicopter composite structure are reviewed. Metal fastener-composite structure potential problem areas are discussed, including galvanic compatibility to graphite, interference fit, hole edge crushing and vibration damage. D.L.G.

STABILITY OF BOUNDARY LAYERS WITH POROUS SUCTION STRIPS: EXPERIMENT AND THEORY
G. A. Reynolds, W. S. Saric, H. L. Reed, and A. H. Nayfeh *In* NASA. Langley Research Center Laminar Flow Control Mar. 1982 p 63-74 ref

(Grants NsG-1608; NsG-1255; Contract N00014-75-C-0381)
Avail: NTIS HC A07/MF A01 CSCL 01A

Low turbulence tunnel experiments on the stability and transition of 2 D boundary layers on flat plates with and without suction are described. A number of general suction cases are discussed. Test results showed that the maximum stabilization occurred when the suction was moved toward the Branch I neutral point. An analytical study of the stability of two dimensional, incompressible boundary layer flows over plates with suction through porous strips was performed. The mean flow was calculated using linearized triple deck, closed form solutions. The stability results of the triple deck theory are shown to be in good agreement with those of the interacting boundary layers. An analytical optimization scheme for the suction configuration was developd. Numerical calculations were performed corresponding to the experimental configurations. In each case, the theory correctly predicts the experimental results. J.D.H.

PROBABILITY OF LAMINAR FLOW LOSS BECAUSE OF ICE CRYSTAL ENCOUNTERS
Richard E. Davis *In its* Laminar Flow Control Mar. 1982 p 75-94 refs
Avail: NTIS HC A07/MF A01 CSCL 01A

A method for combining the cloud detector observation results from the Global Atmospheric Sampling Program (GASP) with Knollenberg probe observations of cloud particle concentration from other programs to derive estimates of the ambient concentration of particles larger than a given size was developed. The method was applied to estimate the probability of encountering particle concentrations which would degrade the performance of laminar flow control (LFC) aircraft. It is concluded that LF loss should occur only about one percent of the time in clear air and that flight within clouds should always result in a significant loss of LF, with 90 percent LF loss occurring about one percent of the time. Preliminary estimates of cloud encounter probability are presented for four airline routes, and conclusions are presented as to the best altitudes for cloud avoidance in extratropical and tropical latitudes. CHICAGO MONOSTATIC ACOUSTIC VORTEX SENSING SYSTEM. VOLUME 2: DECAY OF B-707 AND DC-8 VORTICES Final Report, Oct. 1976 - Dec. 1979
D. C. Burnham and J. N. Hallock Washington FAA Sep. 1981 136 p refs
(AD-A109518; DOT-TSL-FAA-79-18-Vol-2; FAA-RD-79-103-Vol-2) Avail: NTIS HC A07/MF A01 CSCL 01/2

A Monostatic Acoustic Vortex Sensing System (MAVSS) was installed at Chicago's O'Hare International Airport to measure the strength and decay of aircraft wake vortices from landing aircraft. The MAVSS consists of an array of acoustic antennas which measure the vertical profile up to 60-m altitude of the vertical component of the wind. The decay in wake vortex strength is measured as the vortex passes over successive antennas in the array. In this volume, the data are analyzed to examine whether landing B-707 and DC-8 aircraft need to be divided into Heavy and non-Heavy categories on the basis of wake vortex hazard. Volume I (published in October 1979) described the MAVSS principles of operation, the hardware developed, and the data reduction methods employed. GRA

PROJECT SEA HUNT: A REPORT ON PROTOTYPE DEVELOPMENT AND TESTS Final Report, 1979 - 1980
J. V. Simmons, Jr. Jul. 1981 66 p refs
(AD-A109510; NOSC/TR-746) Avail: NTIS HC A04/MF A01 CSCL 06/7

During FY 79-80, a prototype Sea Hunt system was built and tested. Sea Hunt utilizes trained pigeons carried in a container attached to the underside of a helicopter to locate objects colored red, yellow or orange. Development of hardware and pigeon training methods are presented. Conclusions based on test data are: Sea Hunt improves detection and localization of appropriate targets; the system is reliable and easily serviced and maintained. A recommendation is made to conduct operational field testing of Sea Hunt at a Coast Guard air station. GRA

DOPPLER RADAR-RESEARCH AND APPLICATION TO AVIATION FLIGHT SAFETY, 1977 - 1979 Final Report
J. T. Lee Jun. 1981 45 p refs
(Contract DOT-FA77WAI-808)
(AD-A109845; FAA-RD-81-79) Avail: NTIS HC A03/MF A01 CSCL 17/9

Thunderstorm turbulence detection and the display of the turbulence location offer a significant advance toward improvement in flight safety and utilization of critical air space. A cooperative program involving the Federal Aviation Administration, U.S. Air Force's Aeronautical Systems Command, and the National Oceanic and Atmospheric Administration's National Severe Storms Laboratory has been conducted under a code name of 'Rough Rider'. An F-4-C aircraft instrumented to record turbulence, temperature and wind during thunderstorm penetrations has been used to obtain in situ measurements of these parameters concurrently with Doppler and conventional weather radar observations. The results of this program indicate that the Doppler measured radial wind component's spectral width holds promise as a turbulence indicator. Turbulence of the severe or greater nature was always accompanied by spectral widths greater than 4 m/s. A second part of the program was to display forenoted Doppler radar data in real time at a Radar Approach Control office and at an Air Route Traffic Control Center. This display provided an insight into requirements for an operational system. Author (GRA)

DETECTION AND TRACKING ALGORITHM REFINEMENT Final Technical Report
G. B. Gustafson and R. K. Crane Washington DOT Oct. 1981 194 p refs
(Contracts DTFA01-81-Y-10521; NA-81-RAC-00072)
(AD-A109517; ERT-P-8035; FAA-RD-81-80) Avail: NTIS HC A09/MF A01 CSCL 01/2

A previous aircraft hazard detection algorithm shown to have high detectability but with a high false alarm rate has been modified to improve reliability for aircraft warnings. The derived Doppler parameter tangential (or radial) shear is incorporated as a radar cell attribute and used in the determination of significant hazard. Further modifications to the processing structure allow for radar operation in a non-automatic mode, thereby accommodating arbitrary changes in PRF, integrator type or scan geometry. A revised output format provides a sorted hierarchical list of derived meteorological structures in a form readily adapted to a graphics display. Author (GRA)

UTD TERRAIN REFLECTION MODEL WITH APPLICATION TO ILS GLIDE SLOPE Ph.D. Thesis
Vichate Ungvichian 1981 278 p
Avail: Univ. Microfilms Order No. 8126070

A terrain reflection model based on the uniform theory of diffraction (UTD) is described which can accommodate any piecewise linear terrain profile, requires less computer time than the physical optics models, is capable of including transverse terrain effects, and determines the reflected fields with all important diffraction and blockage effects included. The results when compared to measurements indicate that this UTD model can accurately predict ILS flight path effects due to ground irregularity. Futhermore, the results obtained from this UTD model are compared against the predictions of a previously developed physical optics (PO) model. UTD and PO predictions in most cases agree with one another, but better results are obtained from the UTD model for truncated or severely upsloping terrain. Dissert. Abstr.

J. Stoppel and M. Degener (DFVLR, Goettingen, West Germany) Ottobrun, West Germany 8 Sep. 1980 20 p refs Presented at 6th European Rotorcraft and Powered Lift Aircraft Forum, Bristol, England, 16-19 Sep. 1980 Sponsored by Bundesministerium fuer Forschung und Technologie
(MBB-UD-303/80-O) Avail: NTIS HC A02/MF A01

A BO-105 helicopter was studied using the NASTRAN program applied to one model with 4400 degrees of freedom and a second with 1300 degrees of freedom. Ground vibration tests were performed on an actual helicopter (CO-105) to determining the modal parameters of the structure within a frequency of 56 Hz for comparison with the models. The suspended aircraft was excited by six electrodynamic exciters. Dynamic response was measured by inductive accelerometers. Comparison of model results with test data shows that most all measured natural modes have a corresponding analytical mode. There were 30 measured natural modes up to 60 Hz. Some 40 modes, including the six rigid body modes, were calculated. Only five modes in the high frequency range from 50 to 70 Hz have no equivalent from measurements. Most of the frequencies show very good agreement between measurement and calculation. Less than perfect correlation is seen for the pitching modes, which are influenced mainly by the tail boom. Central processor times on an IBM 360-370 model 3033 were 100 sec and 500 sec for the simple and complex models, respectively. Author (ESA)

COLD-AIR PERFORMANCE OF A 15.41-cm-TIP-DIAMETER AXIAL-FLOW POWER TURBINE WITH VARIABLE-AREA STATOR DESIGNED FOR A 75-kW AUTOMOTIVE GAS TURBINE ENGINE Final Report

Kerry L. McLallin, Milton G. Kofskey, and Robert Y. Wong Feb. 1982 33 p refs
(Contract DE-AI01-77CS-51040)
(NASA-TM-82644; E-899; NAS 1.15:82644; DOE/NASA/51040-30) Avail: NTIS HC A03/MF A01 CSCL 21E

An experimental evaluation of the aerodynamic performance of the axial flow, variable area stator power turbine stage for the Department of Energy upgraded automotive gas turbine engine was conducted in cold air. The interstage transition duct, the variable area stator, the rotor, and the exit diffuser were included in the evaluation of the turbine stage. The measured total blading efficiency was 0.096 less than the design value of 0.85. Large radial gradients in flow conditions were found at the exit of the interstage duct that adversely affected power turbine performance. Although power turbine efficiency was less than design, the turbine operating line corresponding to the steady state road load power curve was within 0.02 of the maximum available stage efficiency at any given speed. PRELIMINARY RESULTS ON PERFORMANCE TESTING OF A TURBOCHARGED ROTARY COMBUSTION ENGINE

P. R. Meng, W. J. Rice, H. J. Schock, and D. P. Pringle 1982 24 p refs Presented at the 1982 Soc. of Automotive Engrs. Intern. Congr. and Exposition, Detroit, 22-26 Feb. 1982
(NASA-TM-82772; E-1097; NAS 1.15:82772) Avail: NTIS HC A02/MF A01 CSCL 21E

The performance of a turbocharged rotary engine at power levels above 75 kW (100 hp) was studied. A twin rotor turbocharged Mazda engine was tested at speeds of 3000 to 6000 rpm and boost pressures to 7 psi. The NASA developed combustion diagnostic instrumentation was used to quantify indicated and pumping mean effect pressures, peak pressure, and face to face variability on a cycle by cycle basis. Results of this testing showed that a 5900 rpm a 36 percent increase in power was obtained by operating the engine in the turbocharged configuration. When operating with lean carburetor jets at 106 hp (78.3 kW) and 4000 rpm, a brake specific fuel consumption of 0.45 lbm/lb-hr was measured. B.W.

ANALYTICAL INVESTIGATION OF NONRECOVERABLE STALL

Leon M. Wenzel and William M. Bruton Feb. 1982 23 p refs

(NASA-TM-82792; E-1126; NAS 1.15:82792) Avail: NTIS HC A02/MF A01 CSCL 21E

A lumped parameter model of the TF34 engine is formulated to study nonrecoverable stall. Features of the model include forward and reverse flow, radial flow in the fan, and variable corrected speed. The purpose of the study is to point out those parameters to which recoverability is highly sensitive but are not well known. Experimental research may then be directed toward identification of the parameters in that category. Compressor performance in the positive flow region and radial flow in the fan are shown to be important but unknown parameters determining recoverability. Other parameters such as compressor performance during reverse flow and in-stall efficiency have relatively small impact on recoverability. Author

ENERGY EFFICIENT ENGINE SHROUDLESS, HOLLOW FAN BLADE TECHNOLOGY REPORT

C. J. Michael Dec. 1981 91 p refs

(Contract NAS3-20646)

(NASA-CR-165586; NAS 1.26:165586; PWA-5594-199) Avail: NTIS HC A05/MF A01 CSCL 21E

The Shroudless, Hollow Fan Blade Technology program was structured to support the design, fabrication, and subsequent evaluation of advanced hollow and shroudless blades for the Energy Efficient Engine fan component. Rockwell International was initially selected to produce hollow airfoil specimens employing the superplastic forming/diffusion bonding (SPF/DB) fabrication technique. Rockwell demonstrated that a titanium hollow structure could be fabricated utilizing SPF/DB manufacturing methods. However, some problems such as sharp internal cavity radii and unsatisfactory secondary bonding of the edge and root details prevented production of the required quantity of fatigue test specimens. Subsequently, TRW was selected to (1) produce hollow airfoil test specimens utilizing a laminate-core/hot isostatic press/diffusion bond approach, and (2) manufacture full-size hollow prototype fan blades utilizing the technology that evolved from the specimen fabrication effort. TRW established elements of blade design and defined laminate-core/hot isostatic press/diffusion bonding fabrication techniques to produce test specimens. This fabrication technology was utilized to produce full size hollow fan blades in which the HIP'ed parts were cambered/twisted/isothermally forged, finish machined, and delivered to Pratt & Whitney Aircraft and NASA for further evaluation. CF6 JET ENGINE DIAGNOSTICS PROGRAM: HIGH PRESSURE COMPRESSOR CLEARANCE INVESTIGATION

M. A. Radomski Jan. 1982 48 p ref

(Contract NAS3-20631)

(NASA-CR-165580; NAS 1.26:165580; R82AEB169) Avail: NTIS HC A03/MF A01 CSCL 21E

The effects of high pressure compressor clearance changes on engine performance were experimentally determined on a CF6 core engine. The results indicate that a one percent reduction in normalized average clearance, expressed as a fraction of airfoil length, improves compressor efficiency by one percent. Compressor clearances are reduced by the application of rotor bore cooling, insulation of the stator casing, and use of a low coefficient of expansion material in the aft stages. This improvement amounts to a reduction of normalized average clearance of 0.78 percent, relative to CF6-50 compressor, which is equivalent to an improvement in compressor efficiency of 0.78 percent. J.M.S.

EXPERIMENTAL INVESTIGATION OF TURBINE ENDWALL HEAT TRANSFER. VOLUME 1: DESCRIPTION OF EXPERIMENTAL HARDWARE AND TEST CONDITIONS Final Report, 1 Aug. 1977 - 31 Aug. 1981

L. D. Hylton, M. S. Mihelc, E. R. Turner, and R. E. York Wright-Patterson AFB, Ohio AFWAL Aug. 1981 147 p ref 3 Vol.

(Contract F33615-77-C-2030; AF Proj. 3066)

(AD-A110332; DDA-EDR-10363-Vol-1; AFWAL-TR-81-2077-Vol-1) Avail: NTIS HC A07/MF A01 CSCL 21/5

Two turbine cascades were tested at simulated engine conditions to provide a data base of endwall heat transfer data. This data base is intended to be sufficiently complete to provide verification data for refined computational models developed to predict first-stage stator endwall heat transfer in advanced turbine engines. A linear, two dimensional cascade provided the bulk of the data. This cascade provided data to separate the effects of exit Mach number, exit Reynolds number, inlet boundary layer thickness, gas-to-wall temperature ratio, inlet pressure gradients, and inlet temperature gradients. In addition, adiabatic wall temperature and inlet turbulence intensity data are available for this linear cascade runs. A computerized data base was generated. This data base, with its associated software management system, provides the user with relatively easy access to the vast amount of data generated. A full annular, three dimensional cascade was used to acquire data for identifying the radial pressure gradient effects. Tests in the annular cascade were run over a wide range of exit Mach and Reynolds numbers and gas-to-wall temperature ratios, all at levels typical to advanced engines. The facilities, cascade geometry, instrumentation, and data acquisition techniques are discussed, as well as a summary of test conditions and a sample summary data set for both cascades. R.J.F.

Two turbine cascades were tested at simulated engine conditions to provide a data base of endwall heat transfer data. This data base is intended to be sufficiently complete to provide verification data for refined computational models developed to predict first-stage stator endwall heat transfer in advanced turbine engines. Summary plots of the results of both the linear and the annular cascade test programs are given. The data is sufficient to allow the designer to estimate the endwall cooling levels and to locate areas of high heat transfer rates. R.J.F.

Laboratories, Victoria, Australia). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 123-126. 6 refs.

A brief review of wind tunnel wall interference is presented with particular emphasis on 'self correcting' and 'correctable interference' tunnels. Two simple methods of modifying tunnel walls to approximate unconstrained flow streamlines are presented. One method, which requires only very limited computation, involves the use of an analytic expression for the far field flow, and the other, which requires no computation, uses a purely mechanical wall arrangement which deflects appropriately under the applied pressure field. (Author)

A82-26184 # **The dynamic behaviour of propeller anemometers.** P. S. Jackson (Auckland, University, Auckland, New Zealand). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 139-142. 11 refs.

A model equation is developed to predict the response of propeller anemometers in turbulent flow. The equation is nonlinear, and is shown to describe anemometer motion correctly for the situations which are easily simulated in a wind tunnel. Implications for the measurement of turbulent flows are discussed. (Author)

A82-26194 # **The effect of induced sound on the flow around a rectangular body in a wind tunnel.** M. C. Welsh (Commonwealth Scientific and Industrial Research Organization, Div. of Mechanical Engineering, Melbourne, Australia), R. Parker, and S. A. T. Stoneman (Swansea, University College, Swansea, Wales). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 275-278. 14 refs.

The changed character of the flow around a thick blunt flat plate in a flow duct containing self induced resonant sound has been examined. It has been established that induced sound can 'feed back' on the vortex shedding process causing a step change in the shedding frequency increasing the Strouhal number for the plate by up to twice its normal value. In this flow state, the leading edge separation bubble reattaches much closer to the plate's leading edge than normal. Vortices are then shed from the position of flow reattachment and are conveyed downstream to form the wake. (Author)

A82-26208 # **Effect of wakes of upstream stator blades on the rotor of an axial flow compressor.** A. R. Oliver (Tasmania, University, Hobart, Australia). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 385-388. 12 refs. Research supported by the Australian Research Grants Committee.

The effect of stator wakes passing over rotor blades in shifting stagnation points, points of separation and transition as well as the length of transition is discussed. The trailing edge problem is presented. A method of calculating stator wake transport in two dimensional incompressible flow is presented but not concluded for want of knowledge of a viscous trailing edge condition. (Author)

A82-26222 # **An experimental study of steady and quasi-steady jet flaps.** Y. P. Chai and J. M. Simmons (Queensland, University, Brisbane, Australia). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 521-524. 11 refs.

Measurements of the spread of a steady jet flap are reported, as are uses of the measurements in refining the quasi-steady theory. Also described is the extension of this theory to cases involving pitching and plunging motions. The measured center-line of a steady jet flap is shown to differ significantly from that predicted by inviscid steady theory. Incorporation of the measured center-line into the quasi-steady theory of Simmons and Platzer (1978) improves the agreement with measurements of the frequency response of lift on a fixed airfoil with an oscillating jet flap. Simple extensions of the quasi-steady model to cases of pitching and plunging of a jet-flapped airfoil give predictions of frequency response of lift which have trends consistent with measurements. C.R.

A82-26223 # **Results of recent measurements on an oscillating aerofoil.** K. H. Ly and V. A. L. Chasteau (Auckland, University, Auckland, New Zealand). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 525-528. 14 refs.

Forces measured on a two-dimensional NACA 0012 aerofoil oscillating at pitch amplitudes up to 34 deg and heave amplitudes up to 0.2 of chord are presented. Reynolds numbers ranged from 70,000 to 330,000 and reduced frequencies of up to 0.45. In pitch, the greatest differences from the theoretical flat plate prediction occurred at the lowest reduced frequencies and larger amplitudes, and were the result of complicated real flow stall effects; results tended to converge to theoretical values for reduced frequencies greater than 0.4. In pure heave, forward thrust occurred for increasing reduced frequencies. The propulsive efficiency is discussed. Dynamic stall angles in pure pitch are also presented. (Author)

A82-26227 # **The vortex flow field generated by a hovering helicopter.** K. R. Reddy (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 553-556. 11 refs.

Important vortex elements in the wake of a hovering helicopter are identified on the basis of well established fixed wing theory. The vortex positions are specified using experimental results. To make the problem mathematically simple, Willmer's rectangularisation principle is introduced. Using this wake model, the calculated velocity field and blade loading are compared with available helicopter flight data. The comparison shows that the present simple method yields satisfactory results. (Author)

A82-26298 # **Helicopter rotor performance improvement by utilization of swept back parabolic blade tip.** J. J. Philippe and P. Lafon (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), no. 5, 1981, p. 55, 56. Research supported by the Direction des Recherches, Etudes et Techniques.

Swept back parabolic tips designed to improve the working conditions of an advancing blade by reducing the intensity of the shock waves and the drag associated with such shocks are tested in the S2 wind tunnel at Chalais-Meudon on a three-bladed rotor. The influence of the sole planform of the blade tips on the total aerodynamic performance of the rotor, twist angle and the profiles of the tips remaining identical is investigated, and the performance of the reference rotor with rectangular blades is compared with that of the rotor fitted with swept back parabolic tips. Results show that the blade tip optimized for advancing blade conditions gives an overall improvement in performance. D.L.G.

A82-26299 # **Real time digital filtering test in the S1 continuous wind tunnel at Modane.** J. Appel (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), no. 5, 1981, p. 57-61.

A real time digital filtering test was performed in October 1980 in the S1 wind tunnel at Modane to compare the performances of digital filters programmed at various cut-off frequencies with those of analog filters already in use. Results confirm the interest of low-pass filtering at a very low cut-off frequency for restoring static parameters while the model is performing an angle of attack sweep in continuous mode. At the cut-off frequency of 0.5 Hz, the Keimo analog filters are of good quality since the results they give coincide with those of the digital filters to within 0.0001. D.L.G.

A82-26313 **Torsional vibrations of non-uniform rotating blades with attachment flexibility.** V. T. Nagaraj and N. Sahu (Hindustan Aeronautics, Ltd., Helicopter Design Bureau, Bangalore, India). *Journal of Sound and Vibration*, vol. 80, Feb. 8, 1982, p. 401-411. 8 refs.

The torsional vibrations of non-uniform pretwisted rotating blades are studied by using finite element methods based on both the Rayleigh-Ritz and Galerkin formulations. The apparent differences between the matrices obtained from these formulations are explained and, as obtained by using three different orders of elements, results are presented for blades with flexibly attached roots and for a non-uniform blade representative of a bearingless rotor. A parametric study is carried out to resolve a controversy regarding the relative importance of certain terms in the equations of motion of pretwisted rotating blades. In Appendix I, an exact solution is presented for the torsional vibrations of flexibly attached rotating blades with piecewise constant inertia and elastic properties, which serves as a benchmark solution for the finite element results. (Author)

A82-26318 * **High frequency sound emission from moving point multipole sources embedded in arbitrary transversely sheared mean flows.** M. E. Goldstein (NASA, Lewis Research Center, Cleveland, OH). *Journal of Sound and Vibration*, vol. 80, Feb. 22, 1982, p. 499-522. 25 refs.

Formulas are derived for the high frequency sound emission from moving point multipole sources embedded in an arbitrary unidirectional transversely sheared mean flow. The results are used to study the sound generated by non-axisymmetric turbulent jets. The effect of the asymmetry in both the mean flow and the source distribution is accounted for by a 'circumferential directivity factor', which is easily calculated from the solution of a second order ordinary differential equation in the general case and from an explicit formula when the mean flow is symmetric but the source location is not. This factor is used to assess the potential of employing asymmetric velocity profiles that redirect the sound upward to reduce the noise radiation below the flight path of a jet aircraft. (Author)

A82-26319 * **On the generation of side-edge flap noise.** M. S. Howe (Bolt Beranek and Newman, Inc., Cambridge, MA). *Journal of Sound and Vibration*, vol. 80, Feb. 22, 1982, p. 555-573. 21 refs. NASA-supported research.

A theory is proposed for estimating the noise generated at the side edges of part span trailing edge flaps in terms of pressure fluctuations measured just in-board of the side edge on the upper surface of the flap. Asymptotic formulas are developed in the opposite extremes of Lorentz contracted acoustic wavelength large/small compared with the chord of the flap. Interpolation between these limiting results enables the field shape and its dependence on subsonic forward flight speed to be predicted over the whole frequency range. It is shown that the mean width of the side edge gap between the flap and the undeflected portion of the airfoil has a significant influence on the intensity of the radiated sound. The results indicate that the noise generated at a single side of a full scale part span flap can exceed that produced along the whole of the trailing edge of the flap by 3 dB or more. (Author)

A82-26320 **Comments on 'Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery rotor noise'.** G. F. Homicz (Calspan Advanced Technology Center, Buffalo, NY). *Journal of Sound and Vibration*, vol. 80, Feb. 22, 1982, p. 575, 576; Authors' Reply, p. 576, 577. 6 refs.

A82-26340 # **Unsteady response of rectangular wings in spanwise uniform shear flow.** M. Kobayakawa (Kyoto University, Kyoto, Japan). *AIAA Journal*, vol. 20, Apr. 1982, p. 471-476. 8 refs.

An unsteady lifting surface theory based on inviscid and incompressible spanwise shear flow is presented. The stream approaching a thin, rectangular wing is assumed to have a linear shear distribution, and a Poisson type equation is defined for the velocity in unsteady cases, and a Laplace equation for steady cases. The lift distribution is calculated and solved by a method of solution by mode functions. The lifting surface technique in potential flow is shown to be applicable for numerical solutions if the Mach number is set at zero. Calculations are also performed for the response functions to sinusoidal heaving oscillations and sinusoidal gust, corresponding to the Theodorsen function and the Sears function, respectively. M.S.K.

A82-26366 * # **Computational fluid dynamics - The coming revolution.** R. A. Graves, Jr. (NASA, Washington, DC). *Astronautics and Aeronautics*, vol. 20, Mar. 1982, p. 20-28, 62. 28 refs.

The development of aerodynamic theory is traced from the days of Aristotle to the present, with the next stage in computational fluid dynamics dependent on superspeed computers for flow calculations. Additional attention is given to the history of numerical methods inherent in writing computer codes applicable to viscous and inviscid analyses for complex configurations. The advent of the superconducting Josephson junction is noted to place configurational demands on computer design to avoid limitations imposed by the speed of light, and a Japanese projection of a computer capable of several hundred billion operations/sec is mentioned. The NASA Numerical Aerodynamic Simulator is described, showing capabilities of a billion operations/sec with a memory of 240 million words using existing technology. Near-term advances in fluid dynamics are discussed. M.S.K.

A82-26367 * # **Lightning detection and ranging.** C. L. Lennon (NASA, Kennedy Space Center, Cocoa Beach, FL) and H. A. Poehler (RCA Service Co., Cocoa Beach, FL). *Astronautics and Aeronautics*, vol. 20, Mar. 1982, p. 29-31. 6 refs.

A lightning detector and ranging (LDAR) system developed at the Kennedy Space Center and recently transferred to Wallops Island is described. The system detects pulsed VHF signals due to electrical discharges occurring in a thunderstorm by means of 56-75 MHz receivers located at the hub and at the tips of 8 km radial lines. Incoming signals are transmitted by wideband links to a central computing facility which processes the times of arrival, using two independent calculations to determine position in order to guard against false data. The results are plotted on a CRT display, and an example of a thunderstorm lightning strike detection near Kennedy Space Center is outlined. The LDAR correctly identified potential ground strike zones and additionally provided a high correlation between updrafts and ground strikes. M.S.K.

A82-26376 **The Model 412 multi-bladed rotor system.** A. W. Meyers, N. B. Phillips, and D. E. Snyder (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 9 p. 7 refs.

A multibladed soft-inplane main rotor system is being certified for the Bell Model 412 utility helicopter. This rotor system is a third-generation design and is the result of technology developed in earlier multibladed soft-inplane rotor programs. The new rotor was designed to easily retrofit existing helicopters in the field. The design of a fiberglass blade was also included in the program. Torsional loads encountered during the development program were higher than anticipated because of the influence of live twist on rotor response and control loads. Increased trailing edge reflex was used to significantly affect both rotor response and control loads. Bell's technical predictions for the rotor have been confirmed in the development and FAA certification phases of the program. (Author)

A82-26377 **Dynamic stability of low effective flap hinge BMR concepts.** F. J. McHugh, J. A. Staley, and M. W. Sheffler (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 11 p. 6 refs.

The considered Bearingless Main Rotor (BMR) test shows that a five percent effective flap hinge BMR which has acceptable aeroelastic stability characteristics is feasible. Significant advancements regarding the development of the BMR concept will potentially provide a reduction in hub weight, piece parts, and fabrication costs while reducing gust sensitivity and vibratory hub moments. Dual beam and single flex strap designs studied have an equivalent flap hinge offset of approximately five percent of blade radius. The baseline dual beam was found to have a higher level of stability than the single flex strap. G.R.

A82-26378 **Design for the operating environment - Ring-fin tail rotor program.** H. E. Lamont (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 16 p. 6 refs.

A82-27162 **Statistical analysis methods for characterizing composite materials.** G. H. Lemon, J. M. Norton, and M. E. Waddoups (General Dynamics Corp., Fort Worth, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p.733-759. 19 refs. Research supported by the General Dynamics Independent Research and Development Program and U.S. Air Force.

A strength-bounded wearout model and a method for calculating fleet material allowables are developed. Residual strength evaluation and wearout are noted as necessary for reliable assessment of composite components, and the determination of design allowables is reviewed, especially for the dependence on the Weibull shape factor. Assumptions postulated by fracture kinetics for characterizing wearout include the existence of preexisting flaws, growth in a deterministic manner depending on material, stress, and flaw features, and the critical load being a function of instantaneous flaw state. Lifetime predictions are analyzed, along with ramp loading and static failure, creep loading, and closure. M.S.K.

A82-27163 **Durability evaluation of highly stressed wing box structure.** R. V. Wolff and D. J. Wilkins (General Dynamics Corp., Fort Worth, TX). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 761-769. 11 refs. Contract No. F33615-73-C-5104.

Box beams representing a single cell of a multispar conceptual composite wing for a fighter aircraft were tested for durability and damage tolerance. The beams were fabricated from graphite-epoxy tape with aluminum honeycomb core and steel bolts. The selected load conditions were: (1) a cold subsonic temperature that produced more torsion and (2) a supersonic, hot, wet temperature with more relative bending. Static tests were conducted at room temperature, dry conditions, showing the composite to be competitive with metal. Under cold, subsonic conditions five of twelve beams delaminated, partly because of stacking sequence. Five of these beams failed in compression. Under hot (250 deg F), wet, supersonic conditions, five beams were blistered badly enough to be useless after thirteen weeks, due to the exceeding of the local glass transition temperature because of thermal spiking. One-lifetime fatigue testing under these conditions resulted in failure in compression. It is concluded that the use of current epoxy laminating resins in hot, wet conditions is questionable. C.D.

A82-27167 **Growth of four flaw types in graphite/epoxy composites due to fully reversed fatigue.** K. E. Hofer, Jr. and J. Jollay, Jr. (IIT Research Institute, Chicago, IL). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 831-845. 13 refs. Research supported by the IIT Research Institute, Rockwell International Corp., and U.S. Air Force.

An experimental program is presented, which investigates the serviceability of graphite/epoxy composites in terms of the propagation of flaws due to fully reversed fatigue. Flaws most likely to affect tensile residual strength of the composites are studied, which consist of a hole in a composite panel, an embedded sheet of foreign matter, a ply dropped from the composite, and surface scratches. Ultrasonic tracking of the flaw growth appears to be feasible, with the effect of flaw growth on the tensile residual strengths of both the tested laminate types appearing to be minimal or nonexistent. D.L.G.

A82-27168 **Effects of defects on tension coupons undergoing an accelerated environmental spectrum.** D. Y. Konishi (Rockwell International Corp., Los Angeles, CA). In: Fibrous composites in structural design. New York, Plenum Press, 1980, p. 847-860. 7 refs.

A screening program was done to assess the criticality, or ability to sustain a required tensile load, of the effect of defects, including holes, delaminations, ply separations, and scratches in an advanced composite coupon. A coupon test program is described and the results reported. A test spectrum was used which realistically represented the temperature/moisture environment for the aircraft component. A room temperature/dry spectrum was also used for baseline purposes. The AS3501-5A graphite/epoxy failed at the average stress 88.5 ksi. Room temperature residual strength after two lifetimes of ambient spectrum loading was 83 ksi or 94 percent of static strength. A 0.25 inch hole flaw had 43.5 ksi average static strength. Wet, hot specimens had 49.6 ksi static strength. Other flaw and laminate types had similar results. C.D.

A82-27187 **Advanced medium scale real-time system.** T. N. Tucker (U.S. Army, Washington, DC) and A. L. Kelley (Sangamo Weston, Inc., Sarasota, FL). In: ITC/USA/'80; Proceedings of the International Telemetering Conference, San Diego, CA, October 14-16, 1980. Research Triangle Park, NC, Instrument Society of America, 1980, p. 157-168.

The Real-time Data Acquisition and Processing System (RDAPS), which is being delivered to the U.S. Army for rapid processing of test data at remote sites, is described as a computer-controlled telemetry system that is portable, while having enough capacity to convert data at an up to 50 K word rate to engineering units, and then display selected parameters pertinent to inflight testing decisions. The RDAPS system will be used at Edwards Air Force Base, California, in the airworthiness qualifications of such flight vehicles as advanced helicopters. The system will compile, process and display quantitative test data on stability and control, overall performance, vibration, and stress analysis. O.C.

A82-27188 * **Telemetry Computer System at Wallops Flight Center.** H. Bell (NASA, Wallops Flight Center, Wallops Island, VA) and J. Strock (Sangamo Weston, Inc., Sarasota, FL). In: ITC/USA/'80; Proceedings of the International Telemetering Conference, San Diego, CA, October 14-16, 1980. Research Triangle Park, NC, Instrument Society of America, 1980, p. 169-183.

This paper describes the Telemetry Computer System in operation at NASA's Wallops Flight Center for real-time or off-line processing, storage, and display of telemetry data from rockets and aircraft. The system accepts one or two PCM data streams and one FM multiplex, converting each type of data into computer format and merging time-of-day information. A data compressor merges the active streams, and removes redundant data if desired. Dual minicomputers process data for display, while storing information on computer tape for further processing. Real-time displays are located at the station, at the rocket launch control center, and in the aircraft control tower. The system is set up and run by standard telemetry software under control of engineers and technicians. Expansion capability is built into the system to take care of possible future requirements. (Author)

A82-27209 **Small EHF/SHF airborne SATCOM terminal.** A. L. Johnson (USAF, Avionics Laboratory, Wright-Patterson AFB, OH). In: ITC/USA/'80; Proceedings of the International Telemetering Conference, San Diego, CA, October 14-16, 1980. Research Triangle Park, NC, Instrument Society of America, 1980, p. 419-422.

A fifth-generation airborne microwave satellite communication system currently under development is discussed. The terminal, operating in the EHF and SHF bands, is designed to provide secure, anti-jam communication for the airborne command post fleet of EC-135 aircraft. Among the terminal's characteristics are the following: an air-cooled transmitter, a parabolic dish antenna, intermediate frequencies of 70 and 700 MHz, an uncoded parametric amplifier, a rubidium frequency standard, a weight of 1,200 pounds, and a volume of 18 cu ft. The packaging will allow the terminal to be distributed in available rack space rather than requiring a large integrated rack installation as required in previous microwave systems. The processor-controlled terminal is being designed to minimize the complexity involved in turning on and locking up the SATCOM system. A prestored set of frequency, power level, antenna pointing and Doppler mode will permit the terminal to be brought up automatically in a preprogrammed mode without operator interventions. C.R.

A82-27228 **Selection of optimum antennas for tracking telemetry intrumented airborne vehicles.** A. Sullivan (Electro Magnetic Processes, Inc., Chatsworth, CA). In: ITC/USA/'80; Proceedings of the International Telemetering Conference, San Diego, CA, October 14-16, 1980. Research Triangle Park, NC, Instrument Society of America, 1980, p. 597-607.

A simplified method of developing the link budget to determine the required antenna gain is presented. A heuristic analysis is presented to determine whether a low cost fixed antenna can be used or if a tracking system is required. If a tracking system is required, an analysis is presented to determine whether a single axis tracking system will suffice or a two axis tracking system is required. The pros and cons of single channel monopulse versus conical scan are also presented. Additionally, tracking system acquisition aid techniques are discussed. (Author)

A82-27231 **Terrain reflection effects on data reception from airborne vehicles.** C. W. Chandler. In: ITC/USA/'80; Proceedings of the International Telemetering Conference, San Diego, CA, October 14-16, 1980. Research Triangle Park, NC, Instrument Society of America, 1980, p. 625-630.

It is noted that propagation phenomena, particularly the interference between the direct and terrain reflected waves, strongly affect the path loss between the transmitting and receiving antennas. A method of analysis and computer-drawn patterns are presented to show the multi-lobed character and deep nulls that result in range-altitude coverage. The effects created by the antenna pattern, the type of terrain, and polarization are shown. Attention is also given to applying the results to system design. C.R.

A82-27398 **Studies in the history and theory of development of aviation and rocketry and space science and technology (Issledovaniia po istorii i teorii razvitiia aviatsionnoi i raketno-kosmicheskoi nauki i tekhniki).** Edited by B. V. Raushenbakh. Moscow, Izdatel'stvo Nauka, 1981. 284 p. In Russian.

A series of papers is presented on the history and development of aviation and space science and technology. Attention is given to the work of Tsiolkovskii, Kondratiuk, Tsander, and Korolev, and to Soviet efforts in rocket engine design, automatic control of spacecraft, and manned space flight. The development of jet engines and aircraft control systems in the Soviet Union is also considered. B.J.

A82-27401 **Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981.** Conference sponsored by the Society for the Advancement of Material and Process Engineering. Azusa, CA, Society for the Advancement of Material and Process Engineering (National SAMPE Technical Conference Series. Volume 13), 1981. 709 p. $80.

Advanced composites materials, applications, processing, and combinations were discussed. Fillers and reinforcements for improved plastics were examined, along with core materials for use with polymer and graphite face sheets, curing process effects on adhesive properties, moisture degradation in composites, and the effects of environmental exposure. Applications and tests of composites and foams for aircraft structures, spacecraft antenna reflectors, solar mirrors, a helicopter fuselage, electronic systems encapsulants, and wings were described. Different mixtures for structural adhesives, metal-to-metal bonding, and polymers based on botanical oils were detailed. Preparation techniques for fiber reinforcements, with radiation curing, for low temperature field repairs, and for thickness control to enhance peel strength were reviewed. M.S.K.

A82-27402 **Flight service evaluation of advanced structures.** C. W. Schneider (Lockheed-Georgia Co., Advanced Structures Dept., Marietta, GA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 1-12. 8 refs.

Extended service tests of composite structures on operational aircraft are reported, specifically for the use of boron and graphite-epoxy materials at Lockheed. Reviews are given of a boron wing tip on a C-141, along with a boron oleo door, boron slats on the C-5A, and a boron-reinforced center wing on a C-130. Graphite structures have been used as C-5 wing-to-body fairing panels, fixed trailing edge panels, and a fairing covering the joint between the center and outer wing. Another program currently involves composite leading edges for the C-141. The composites have all replaced metal materials at a lower cost and have displayed greater durability, to the extent that the metal substructures sometimes corroded beneath the composite components, which showed no signs of wear. The flight program reported had run for 10 yr, with further tests continuing on the C-141 leading edge. M.S.K.

A82-27403 **Damage tolerance and durability design of composite structures for commercial aircraft.** E. Chow and C. Y. Kam (Douglas Aircraft Co., Long Beach, CA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 13-25. 8 refs.

The development of composite structures to the point of acceptability by the FAA for use in commercial aircraft, and to the consideration of composite structures for safety-critical aircraft components is reviewed, based on the experience at McDonnell Douglas. Secondary structures such as the DC-10 upper aft rudder, vertical stabilizer trailing edge panel, and floor beams, a Kevlar tail cone and fan cowl doors and a Kevlar/polyimide nacelle stang fairing for the DC-9 are described. Current testing includes a nose gear aft door, aileron access panel, and the vertical stabilizer box for the DC-10. Initial tests established the mechanical characteristics of the composites, the structural reliability of the design concepts, and confirmed the structural integrity of the integrated parts. Fibrous composites are noted to differ from metal parts in anisotropy and nonhomogeneity and comprehensive trials to solve problems of potential complex failure modes are recommended. M.S.K.

A82-27404 **Light weight adhesive joining of composite structures.** K. D. Creasy (M & T Chemicals, Inc., Los Angeles, CA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 26-31.

The procedures, characteristics, and performance of adhesively joined composite structures for aircraft parts are outlined. Adhesives are noted to form effective moisture barriers, provide good stress distribution, avoid bimetallic corrosion, and offer fatigue resistance and low cost use. Methods of field repairs are reviewed, and adhesive bonding of aluminum and NOMEX honeycomb aircraft parts have been demonstrated to have an overlap shear strength ranging from 1000-2500 psi. Heat cure epoxy adhesives have shown high compressive strength at 350 F, although maintaining a sufficient rigidity modulus with desirable resilience and toughness above 250 F has caused difficulties. Urethane compounds have been developed which retain strength below -65 F and a peel strength of 150 psi is projected in applications on aluminum substrates. The thixotropy displayed after initial curing allows gap filling to occur. M.S.K.

A82-27407 **Service sensitivity of polysulfide sealants.** R. J. Stout (General Dynamics Corp., Fort Worth, TX). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 64-78.

Investigations into incidents of sealant chalking and sponging of MIL-S-83430 sealants in Air Force aircraft are reported. The polysulfide sealants began chalking a short time after entering service. Subsequent X-ray spectrographic analyses of chalked and unchalked surfaces revealed the chalk to be a concentration of sealant fillers, mainly calcium carbonate. The chalking was precipitated by fuel extraction of the elastomeric component of the sealant and accelerated by the presence of mercaptans and metallic ions in the fuel. The chalking penetration into the sealant was determined to be of negligible rate. Sealant sponging in fuel test tanks was examined in terms of a thermal history and service use of a fuel-saturated sealant at high temperatures were concluded to cause the sponging. Qualifications tests did not include rapidly increasing temperatures when transition to supersonic speeds occurs with a nearly empty fuel tank. M.S.K.

A82-27412 **A new resin for field repair.** E. S. Dilanni, A. H. McLeod (Acurex Corp., Aerotherm Div., Mountain View, CA), F. J. Riel (Rohr Industries, Inc., Chula Vista, CA), and R. H. Gray (Rohr Industries, Inc., Riverside, CA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, The threat alert and collision avoidance system is examined. The technical and policy aspects of air transportation safety are reviewed. S.L.

STATISTICAL ANALYSIS AND TIME SERIES MODELING OF AIR TRAFFIC OPERATIONS DATA FROM FLIGHT SERVICE STATIONS AND TERMINAL RADAR APPROACH CONTROL FACILITIES: TWO CASE STUDIES Final Report, Oct. 1979 - Sep. 1980
Norman J. Meyerhoff and George H. Wang Washington FAA Oct. 1981 60 p refs
(AD-A109873; TSC-FAA-81-18; DTS-522; DOT-FAA-EM-82-13) Avail: NTIS HC A04/MF A01 CSCL 17/7

Two statistical procedures have been developed to estimate hourly or daily aircraft counts. These counts can then be transformed into estimates of instantaneous air counts. The first procedure estimates the stable (deterministic) mean level of hourly or day of the week patterns by statistical models. The second procedure estimates both deterministic and stochastic periodic (hourly or day of the week) patterns by stochastic time series models. Both statistical procedures have been used to analyze traffic at the St. Louis TRACON and Los Angeles Flight Service Station. This report analyzes hourly variations in operations at the St. Louis TRACON, for each day in four representative months in 1979. It also analyzes daily variations for three months in 1979 of flight plan activity at the Los Angeles FSS. The results of these analyses are given preliminary interpretations, and are available for possible application to other facilities. They are also available for other applications, such as estimation of instantaneous air counts in hubs. GRA

OPERATIONAL DELAY DAY FORECASTS FOR THE 20 AIR ROUTE TRAFFIC CONTROL CENTERS FOR THE YEAR 1982 THROUGH 2011 Final Report
W. Livingston Jun. 1981 24 p refs
(AD-A109844; FAA-RD-81-93) Avail: NTIS HC A02/MF A01 CSCL 17/7

The effect of forecasts of increased traffic growth at each of the 20 CONUS Air Route Traffic Control Centers has been examined to determine the impact upon processor utilization of the Central Computer Complex at each center. The study assumes continuation of the current operational capabilities and procedures at each center, and is based upon field data collected between June 1980 and January 1981, and the June 1981 forecast of the IFR aircraft handled at the 20 Air Route Traffic Control Centers. Other factors such as channel utilization are not included in this phase of the study. Author (GRA)

SIMULATION OF THE XV-15 TILT ROTOR RESEARCH AIRCRAFT
Gary B. Churchill (Army Aeromechanics Lab., Moffett Field, Calif.) and Daniel C. Dugan Mar. 1982 23 p refs
(NASA-TM-84222; A-8848; NAS 1.15:84222) Avail: NTIS HC A02/MF A01 CSCL 01C

The effective use of simulation from issuance of the request for proposal through conduct of a flight test program for the XV-15 Tilt Rotor Research Aircraft is discussed. From program inception, simulation complemented all phases of XV-15 development. The initial simulation evaluations during the source evaluation board proceedings contributed significantly to performance and stability and control evaluations. Eight subsequent simulation periods provided major contributions in the areas of control concepts; cockpit configuration; handling qualities; pilot workload; failure effects and recovery procedures; and flight boundary problems and recovery procedures. The fidelity of the simulation also made it a valuable pilot training aid, as well as a suitable tool for military and civil mission evaluations. Simulation also provided valuable design data for refinement of automatic flight control systems. Throughout the program, fidelity was a prime issue and resulted in unique data and methods for fidelity evaluation which are presented and discussed. R.J.F.

BOOM PROBE POSITION ERROR CORRECTIONS FOR SEA KING Mk 50 FLIGHT TESTS
M. J. Williams Jul. 1981 34 p refs
(AD-A109428; ARL/AERO-TM-331; AR-002-297) Avail: NTIS HC A03/MF A01 CSCL 01/3

Position error has been determined for a nose-boom mounted pitot static probe installed on a Sea King Mk. 50 helicopter. The error is sensibly constant in the speed range 35 - 110 knots and is unchanged in climb and descent. Corrections to be applied to indicated nose boom values are 7.5 knots in velocity, and up to 80 ft. in altitude. Author (GRA)

A surface singularity potential flow code, ROTAIR, has been assembled for the calculation of detailed surface pressures on rotors in hover or climb. This method is basically a marriage of two codes: the fixed-wing surface singularity doublet code and the rotor lifting-surface code. The program includes a tip vortex separation model. Also, the rotor tip surface is panelled so that pressures are calculated right around the tip-edge surface. Preliminary calculations have verified the capabilities of the program for computing blade surface properties in the presence of a close-vortex passage. Additionally, calculated pressure distributions compare favorably with experimental data for a low aspect ratio two-bladed rotor, and the calculated circulation distribution is consistent with that computed earlier with the lifting-surface code. Finally, the newly developed far-wake doublet model promises to keep computing efforts practical. Author (GRA)

SIMULATOR STUDY OF A PICTORIAL DISPLAY FOR GENERAL AVIATION INSTRUMENT FLIGHT

James J. Adams Mar. 1982 58 p refs
(NASA-TP-1963; L-14675; NAS 1.60:1963) Avail: NTIS HC A04/MF A01 CSCL 01D

A simulation study of a computer drawn pictorial display involved a flight task that included an en route segment, terminal area maneuvering, a final approach, a missed approach, and a hold. The pictorial display consists of the drawing of boxes which either move along the desired path or are fixed at designated way points. Two boxes may be shown at all times, one related to the active way point and the other related to the standby way point. Ground tracks and vertical profiles of the flights, time histories of the final approach, and comments were obtained from time pilots. The results demonstrate the accuracy and consistency with which the segments of the flight are executed. The pilots found that the display is easy to learn and to use; that it provides good situation awareness, and that it could improve the safety of flight. The small size of the display, the lack of numerical information on pitch, roll, and heading angles, and the lack of definition of the boundaries of the conventional glide slope and localizer areas were criticized. A.R.H.

(AD-A109431; AFAMRL-TR-81-133) Avail: NTIS HC A04/MF A01 CSCL 01/3

A new wide-angle, dual-eye, helmet-mounted display has been designed. Two images combine, with a 15 deg. central field overlap, to provide a panoramic display 102 deg. wide by 45 deg. tall, with a resolution to approximately 1000 TV lines per eye. The image-generating device is a miniature 18 mm CRT. The optics, which are symmetrical for both eyes, comprise partially reflective plastic reflectors, five small glass lens elements, and a 2:1 fiber optic magnifier. A 12 mm exit pupil is obtained with enough eye relief to permit the user to wear glasses, with an interpupillary adjustment of 58 to 73 mm. Total weight of the device, not including the Air Force flight helmet type HGU-2A/P upon which it is mounted, is less than 3 pounds. Author (GRA)

DUALCHANNEL FUEL CONTROL PROGRAM, PHASE 2 Final Report, Apr. 1978 - Aug. 1980
John Itamoto Adelphi, Md. HDL Aug. 1981 81 p refs
(Contract N00019-78-G-0288)
(AD-A108715; Rept-41-2710A; HDL-CR-81-288-1) Avail: NTIS HC A05/MF A01 CSCL 21/5

This report presents the results of a program conducted by Garrett to investigate a dual-channel fuel control for gas turbine engines which could be used in military ground vehicles. The program presents a control system with requirements that are deemed necessary to provide a military gas turbine-powered vehicle with battlefield survivability and minimal restriction on the capability of completing the vehicle mission. This study showed that a parallel dissimilar technology backup control was the desirable approach and that fluidics was the ideal technology to perform this function due to its low cost, reliability, immunity to radiation, and ability to perform computation and logic commensurate with the requirements of achieving mission completion with no degradation in the vehicle's battlefield survivability. N82-20186*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
A TRANSLATIONAL VELOCITY COMMAND SYSTEM FOR VTOL LOW SPEED FLIGHT
Vernon K. Merrick Mar. 1982 30 p refs
(NASA-TM-84215; A-8825; NAS 1.15:84215) Avail: NTIS HC A03/MF A01 CSCL 01C

A translational velocity flight controller, suitable for very low speed maneuvering, is described and its application to a large class of VTOL aircraft from jet lift to propeller driven types is analyzed. Estimates for the more critical lateral axis lead to the conclusion that the controller would provide a jet lift (high disk loading) VTOL aircraft with satisfactory 'hands off' station keeping in operational conditions more stringent than any specified in current or projected requirements. It also seems likely that ducted fan or propeller driven (low disk loading) VTOL aircraft would have acceptable hovering handling qualities even in high turbulence, although in these conditions pilot intervention to maintain satisfactory station keeping would probably be required for landing in restricted areas. Author

DESIGN CRITERIA FOR FLIGHTPATH AND AIRSPEED CONTROL FOR THE APPROACH AND LANDING OF STOL AIRCRAFT
James A. Franklin, Robert C. Innis, Gordon H. Hardy, and Jack D. Stephenson Mar. 1982 98 p refs
(NASA-TP-1911; NAS 1.60:1911; A-8645) Avail: NTIS HC A05/MF A01 CSCL 01C

A flight research program was conducted to assess requirements for flightpath and airspeed control for glide-slope tracking during a precision approach and for flare control, particularly as applied to powered-lift, short takeoff and landing (STOL) aircraft. Ames Research Center's Augmentor Wing Research Aircraft was used to fly approaches on a 7.5 deg glide slope to landings on a 30 X 518 m (100 X 1700 ft) STOL runway. The dominant aircraft response characteristics determined were flightpath overshoot, flightpath-airspeed coupling, and initial flightpath response time. The significant contribution to control of the landing flare using pitch attitude was the short-term flightpath response. The limiting condition for initial flightpath response time for flare control with thrust was also identified. It is possible to define flying-qualities design criteria for glide-slope and flare control based on the aforementioned response characteristics. M.D.K.

SELF-TUNING REGULATORS FOR MULTICYCLIC CONTROL OF HELICOPTER VIBRATION
Wayne Johnson Mar. 1982 50 p refs
(NASA-TP-1996; NAS 1.60:1996; A-8719) Avail: NTIS HC A03/MF A01 CSCL 01C

A class of algorithms for the multicyclic control of helicopter vibration and loads is derived and discussed. This class is characterized by a linear, quasi-static, frequency-domain model of the helicopter response to control; identification of the helicopter model by least-squared-error or Kalman filter methods; and a minimum variance or quadratic performance function controller. Previous research on such controllers is reviewed. The derivations and discussions cover the helicopter model; the identification

Two turbine cascades were tested at simulated engine conditions to provide a data base of endwall heat transfer data. This data base is intended to be sufficiently complete to provide verification data for refined computational models developed to predict first-stage stator endwall heat transfer in advanced turbine engines. A linear, two dimensional cascade provided the bulk of the data. This cascade provided data to separate the effects of exit Mach number, exit Reynolds number, inlet boundary layer thickness, gas-to-wall temperature ratio, inlet pressure gradients, and inlet temperature gradients. In addition, adiabatic wall temperature and inlet turbulence intensity data are available for the linear cascade runs. A computerized data base was generated. This data base, with its associated software management system, provides the user with relatively easy access to the vast amount of data generated. A full annular, three dimensional cascade was used to acquire data for identifying the radial pressure gradient effects. Tests in the annular cascade were run over a wide range of exit Mach and Reynolds number and gas-to-wall temperature ratios, all at levels typical of advanced engines. A user's manual is presented. The research effort continues to be focused on high density/high energy hydrocarbons. In cooperation with researchers at Wright-Patterson Air Force Base, heats of combustion are measured for constituents of current ramjet fuels and for finished fuels; meanwhile, pure hydrocarbons are synthesized for heat-of-combustion measurement whose unusual steric or strain energies may contribute to design of high energy/high density fuels of the future. Four pure hydrocarbons studied were selected among the alkylnaphthalenes and indans that may exhibit unusual steric energies. One unusual hydrocarbon, with very high density and a cage-like molecular structure, was also studied. This substance is undergoing preliminary testing as an experimental fuel. Synthesis and purification of hydrocarbons for future study are in progress at Oklahoma State University. New equipment and procedures were developed for application of the differential scanning calorimeter on measurements of heat capacity of fuels and their constituents. Preparation is underway to study the heat of combustion of several special liquid hydrocarbon fuels. GRA

RESEARCH ON TURBINE ROTOR-STATOR AERODYNAMIC INTERACTION AND ROTOR NEGATIVE INCIDENCE STALL Final Report, Mar. 1979 - Nov. 1981
R. P. Dring, H. D. Joslyn, L. W. Hardin, and J. H. Wagner Wright-Patterson AFB, Ohio AFWAL Nov. 1981 107 p refs
(Contract F33615-80-C-2008; AF Proj. 3066)
(AD-A110341; UTRC/R81-915048; AFWAL-TR-81-2114) Avail: NTIS HC A06/MF A01 CSCL 20/4

The aerodynamic interaction between the rotors and stators of a large scale axial turbine stage have been studied experimentally. The data included measurements of the time averaged and instantaneous surface pressures and surface thin film gage output on both the rotor and stator at midspan. The data also included measurement of the stator suction and pressure surface time averaged heat transfer at midspan. The data was acquired with rotor-stator axial gaps of 15% and 65% of axial chord. The upstream potential flow influence of the rotor on the stator was seen as well as the downstream potential flow and wake influences of the stator on the rotor. The second phase of the program was an investigation of the nature of the full-span steady flow over the rotor with incidence varying up to negative incidence stall. Full-span pressure distributions and surface flow visualization were acquired over the entire range of incidence. The data indicated separation-free flow and large radial flows on the pressure surface in the vicinity of design incidence. GRA

COATINGS IN THE AERO GAS TURBINE
R. H. Wedge and A. V. Eaves 1980 12 p ref
(PNR-90049) Avail: NTIS HC A02/MF A01

The types of sprayed coatings used are defined, and coating requirements for each section of the gas turbine engine are discussed. Main problem areas are defined as hammer wear at compressor blade (snubber) abutment faces, and turbine blade shroud abutment faces; fretting wear particularly of compressor blade and vane roots rubbing and vane roots rubbing and sliding wear in various applications; the requirement to maintain clearances in gas path seals; and the effects of overheating and thermally cycling turbine parts, particularly rotor blades. The need to restore deliberately overmachined and accidentally overmachined parts is also discussed. Factors to be considered in coating selection are described with particular reference to the application requirements, the types of coating that might be used, and coatings that have proved to give the best results. The relationship between coating performance and cost effectiveness is illustrated with examples. Author (ESA)

PROCESS DEVELOPMENT AND EVALUATION OF GAS TURBINE ENGINE COMPONENTS IN IMI 829
R. M. Duncan (IMI Kynoch Ltd.), R. E. Goosey (IMI Kynoch Ltd.), R. H. Jeal, and P. J. Postans 1980 12 p refs
(PNR-90050) Avail: NTIS HC A02/MF A01

Measurements of basic physical properties and mechanical property evaluation of a range of typical gas turbine parts were performed on this titanium alloy (Ti-Al-Sn-Zr-Nb-Mo-Si). It is a near-alpha alloy. It has a density of 4.54 g/cu cm and the alpha + beta/beta transformation temperature is nominally 1015 C. Tensile tests of disk and ring forgings show that: at 20 C the 0.2% proof stress is 30 MPa lower than for IMI 685, but both alloys have similar strength at 540 C. Tensile strength is unaffected by forging route and microstructure, but tensile ductility tends to improve as the grain size decreases. The test results show some scatter but at 20 C the average elongation is 13% with the finest grain size and 8% for the coarsest grain size, and at 540 C the elongations are 15% and 11%, respectively. Creep strength is 20 C superior to IMI 685. Fracture toughness is similar to IMI 685 as are crack growth rates. Author (ESA)

THE TESTING AND APPROVAL OF AIRCRAFT ENGINE MOUNTED ACCESSORIES
D. S. Pearson 1980 21 p ref
(PNR-90051) Avail: NTIS HC A02/MF A01

Measurement techniques, data assessment criteria, physical interpretation and laboratory simulation methods applicable to accessory vibration testing are reviewed. The inadequacies of endurance approval testing of accessories by applying undirectional single frequency excitation to simulate engine conditions at a particular shaft speed are shown. A measurement and assessment technique is described which recognizes the effect of multifrequency vibration in three planes. An experimental specification for accessories, based on the technique, is outlined. Case histories of vibration induced accessory failure are cited. Author (ESA)

DEVELOPMENTS TO IMPROVE THE NOISE AND COMBUSTION EMISSIONS ON THE FOKKER F28 AIRCRAFT AND ITS ROLLS-ROYCE RB183-555 ENGINES. SECTION 1: DEVELOPMENT OF THE NEW INTERNAL 10-LOBE MIXER
S. L. Sarin (Royal Netherlands Aircraft Factories Fokker), K. Goddard, and N. J. Wilson 1981 15 p
(PNR-90061) Avail: NTIS HC A02/MF A01

Theoretical and practical aspects of exhaust mixer design for turbofan engines are discussed. The effects on fuel consumption and noise reduction of annular and multilobed internal mixers are compared. The production version of a multilobed mixer is described. The lobed mixer reduces total noise by 5.75 dB A and fuel consumption by 4%. The development trends of exhaust mixers, with particular reference to high bypass ratio engines are also discussed. Author (ESA)

N82-21208# Rolls-Royce Ltd., Derby (England).
ENGINES FOR AIR TRANSPORT
A. G. Newton 1981 52 p
(PNR-90066) Avail: NTIS HC A04/MF A01

The status and trends of commercial aircraft transportation systems were reviewed. The characteristics and specific consumption of aviation fuel are emphasized. It is shown that in the next 15 years the fuel consumption of current large fan engines can be reduced by 15%. The quality of fuel will deteriorate relative to today, which will place greater demands on engine design. Further improvements in fuel economy using engines designed for lower specific thrust appear feasible. The development of a full authority digital control system and its effects on fuel consumption are also discussed. Author (ESA)

ALLOWING FOR THE WALL BOUNDARY LAYER IN A STAGE OF AN AXIAL COMPRESSOR
N. S. Berestneva, N. A. Kocal, F. G. Kentsevich, and Y. G. Otsechkin Jan. 1981 9 p refs Transl. into ENGLISH from Samoletostr. Tekh. Vozdush. Flota (USSR), no. 43, 1978 p 51-54 In ENGLISH and RUSSIAN
(PNR-90067; Trans-15546; TLT-00815) Avail: NTIS HC A02/MF A01

The geometric characteristics of the tested stage and the grid parameters are given. The coefficient of adiabatic pressure of the stage is taken as 0.26 at a coefficient of consumption of 0.447. The stage is a model of the initial stage of a high pressure compressor. The operation of the stage in the calculated field of input speeds leads to a 3.5 % increase in its maximum efficiency with no influence upon the limit of its operational stability. Author (ESA)

SIMULATION OF TURBOFAN ENGINE MODELS IN THE WEYBRIDGE LOW SPEED WIND TUNNEL
R. F. H. Storey Jun. 1981 7 p
(BAe-Inform-Note-46) Avail: NTIS HC A02/MF A01

A control arrangement for the gas supply to a low speed wind tunnel is suggested. Clean dry nitrogen gas at up to 1500 lb/sq in and 90 C is supplied from a mobile dispenser at 4.2 lb/sec. Gas pressure is reduced to 400 lb/sq in and drives two model turbofan engines. The flow from the dispenser into the models is controlled by servovalves operating hydraulically from pressure transducer signals. Materials and supply sources are listed. Author (ESA)

N82-21213# Aeronautical Research Labs., Melbourne (Australia).
THE STABILITY OF PORTABLE BRIDGES CARRIED ON SLINGS BENEATH HELICOPTERS
N. Matheson Jan. 1980 56 p refs
(ARL/Aero-Rept-154; AR-001-787) Avail: NTIS HC A04/MF A01

Information available concerning the operation of helicopters carrying airportable bridges is reviewed. In addition, a series of wind tunnel tests were made with 1/15 scale models to determine the maximum safe speed for a helicopter carrying two different class 16 bridges, a 16 m (52 ft) clear span, and a 22 m (72 ft) raft, separately on a single hook. The tests indicated that the 16 m (52 ft) bridge can be carried safely at speeds up to 65 knot on a 16 m (53 ft) cable, provided it was slung 0 deg nose up in the static condition, and two small flat fins were attached to the aft end. The raft was carried in two loads, A and B, because of weight limitations. Load A, which consisted mainly of deck bases and accessories, can be safely carried without fins at speeds up to 60 knot on a 16 m (53 ft) cable provided it was rigged 1 to 2 deg nose up. Load B, which consisted of four ramps and four articulators, can also be carried at 60 knot, but small flat fins were required and it had to be slung 5 deg nose up and carried on a 10 m (33 ft) cable. DIGITAL COMMAND AUGMENTATION FOR LATERAL-DIRECTIONAL AIRCRAFT DYNAMICS Annual Technical Report, 1 Feb. 1979 - 31 Jan. 1980
David Atzhorn Arlington, Va. ONR May 1981 198 p refs
(Contract N00014-78-C-0257; NR Proj. 300-003)
(AD-A110274; MAE-1511; ONR-CR-300-003-2) Avail: NTIS HC A09/MF A01 CSCL 01/2

Linear-quadratic sampled-data regulator theory is used to design several Type 0 and Type 1 control laws for lateral-directional aircraft dynamics. Control structures are defined for singular command inputs and for control rate outputs; the former allows for precise following of a command whose integral appears in the state vector, while the latter uses both a difference approximation and the Tustin transform to characterize control rate in the discrete-time domain. Type 0 controllers with control rate restraint and equivalent Type 1 controllers are implemented in a microprocessor-based digital flight control system, and flight tests are conducted using Princeton University's Variable-Response Research Aircraft. The control system, entitled CAS-4, offers four combinations of control: direct (unaugmented) control, Type 0 control with both roll rate/sideslip angle and roll rate/lateral acceleration command combinations, and Type 1 control with roll/sideslip angle command. Ground-based hybrid simulation and flight test results show that major closed-loop response features are unaffected by the choice of sampling rate when sampled-data regulator theory is used. Consequently, much lower sampling rates than would normally be expected can be used when control laws are derived in this manner. GRA

INFLUENCE OF STRAKES ON COEFFICIENTS OF LONGITUDINAL STABILITY Thesis - Tech. Univ., Munich [EINFLUSS VON STRAKES AUF DIE BEIWERTE DER LAENGSBEWEGUNG]
Gerhard Wolfrum 20 Dec. 1979 190 p refs In GERMAN
(MBB-FE-122/S/PUB/22) Avail: NTIS HC A09/MF A01

In a subsonic wind tunnel the influence on the longitudinal stability of seven different strakes mounted on five basic wings was measured. Size of the strake and lift are directly related, while the aerodynamic drag is determined by the basic wing. The importance of pitch is influenced by the strake in relation with the lift. The efficacy of right strakes on more or less swept back wings against buffeting is particularly strong in the subsonic area. In general, strakes do not influence substantially the outline of the aerodynamic configuration, but their size remains the most important single parameter to obtain longitudinal stability. Author (ESA)

N82-21216# Royal Aircraft Establishment, Farnborough (England).
SOME REMARKS ON BUFFETING
D. G. Mabey Feb. 1981 35 p refs Presented at Von Karman Inst. for Fluid Dyn. Lecture Ser. on Unsteady Airloads and Aeroelastic Probl. in Separated and Transonic Flows, Brussels, 10 Mar. 1981
(RAE-TM-Struct-980; BR78530) Avail: NTIS HC A03/MF A01

Buffeting is defined as the structural response to the aerodynamic excitation produced by separated flows. The aerodynamic excitation produced by bubbles, vortices and transonic flows is discussed. Different buffeting criteria for the wings of fighter and transport aircraft are developed. Methods of predicting the onset and severity of buffeting are reviewed. Typical examples are discussed, in which improvements in wing buffeting are compared with changes in mean force measurements. Buffeting measurements on ordinary models in a cryogenic wind tunnel are analyzed. The measurements confirm that cryogenic tunnels can separate Reynolds number and aeroelastic effects. The frequency parameter must be correct on the model if the aerodynamic excitation does not have a flat spectrum, as at vortex breakdown on a slender wing. Author (ESA)

Many aircraft accidents involve tail rotor strikes. Replacing the helicopter fin with an airfoil-shaped cross-section ring provides greater safety, increases thrust and lowers noise. Full-scale ground, wind-tunnel, and feasibility flight testing shows that the rotor blade tip vortices educt air around the guard ring by external mixing to produce increased thrust for the same power input and a larger maximum available value. Acoustic data under static thrust conditions show reduced noise levels up to eight dBA by the use of the thrust ring and lowered operating tip speeds. Improved aircraft handling qualities are also indicated by feasibility flight test data. Applying the thrust ring to the main rotor requires a light ring and a relatively small rotor. Lighter transmissions, smaller antitorque devices and a compact construction would be pluses. Negatively, there would be problems with the weight of the ring and unknown factors in aerodynamics, controllability, and stability. C.D.

A82-26379 **The general purpose research rotor - Design features and considerations.** A. Z. Lemnios and R. Jones (Kaman Aerospace Corp., Bloomfield, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980. Paper.* 16 p. 6 refs.

The General Purpose Research Rotor (GPRR) involves an in-depth preliminary design of a configuration which has multifunctional capabilities that can be used to investigate several different optional configurations with minor modifications to the basic structure. It is pointed out that, even with a number of advancements made with respect to airfoil design and tip shapes, significant problems still exist in the development of helicopter rotors. In particular, a better understanding is required of the rotor parameters which affect performance, vibration, noise, and stability. The GPRR provides a configuration which is ideally suited to study the sensitivity of these characteristics to configurational changes. The GPRR is a four-bladed configuration with each blade fabricated from composite materials. Attention is given to a conceptual study, a parametric study, a feasibility study, the evaluation of a selected configuration, and aspects of technological payoffs. G.R.

A82-26380 **Design of higher harmonic control for the ABC.** J. O'Leary and W. Miao (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 11 p. 9 refs.

Attention is given to the vibration characteristics of the ABC helicopter, ABC vibration with higher harmonic control (HHC), an active vibration controller, and the implementation of HHC on the ABC XH-59A helicopter. It is found that HHC is ideal for the ABC helicopter because of its large operational range of rotor speeds and natural interrotor load cancellation. It is feasible to achieve a 90% reduction of vibration through HHC. HHC requirements are in the range of 0.5 to 2 deg depending upon the harmonic frequency of the input. HHC does not alter the interrotor cancellation characteristic of the ABC rotors. The existing interrotor cancellation on the ABC helicopter makes the HHC application easier. G.R.

A82-26381 **CH-46 and CH-47 composite rotor blade lightning protection testing.** G. Heiderscheidt and J. Sarro (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 8 p.

A helicopter composite rotor blade suited to the lightning environment must be able to withstand a single strike of 200,000 amps and multiple strikes of 50,000 amps or less with only minor damage. The main element in the CH-46 and CH-47 lightning protection system is the titanium nosecap. All metal parts of the blade are either shielded by it or conduct to it. A conductive path leads from the cap to the metal rotor hub and then to the other metal sections of the aircraft. High-voltage long-arc tests involved 17 strikes averaging between 10,000 and 12,000 amps peak. Only minor damage occurred, including pitting and loosening of the top bonding strap. Swept-stroke tests involved 100 amp continuing current with 50,000 amp restrike swept from one blade to the next. No significant damage was seen. High current tests, including three 200,000 amp artificial lightning strikes, resulted in bond strips being blown away but no serious damage. C.D.

A82-26382 **A preliminary investigation of Individual Blade-control Independent of a Swashplate.** K. F. Guinn (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 9 p. 11 refs.

A description is presented of the Individual Blade-control Independent of a Swashplate (IBIS) system, taking into account system components and their function. The IBIS fly-by-light control system is a unique concept for controlling the rotor blades of a helicopter of V/STOL aircraft. The concept stresses simplicity and utilization of integrated subsystems which inherently increase reliability while reducing weight and cost. Secondary flight control actuators are not needed with the fly-by-light system since secondary functions such as autopilot and SAS may be implemented simultaneously through the primary control actuators. By proper use of signal limiting, secondary control authority and rate limits may be provided by electronic circuitry instead of by secondary actuators with velocity and stroke limitations. G.R.

A82-26383 * # **Selection of some rotor parameters to reduce pitch-roll coupling of helicopter flight dynamics.** R. T. N. Chen (NASA, Ames Research Center, Moffett Field, CA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadephia, PA, Oct. 22-24, 1980, Paper.* 19 p. 21 refs.

The results of a study conducted to investigate further a means of choosing primary rotor parameters to reduce the coupling of longitudinal and lateral flapping in hover and in forward flight are presented. The rotor parameters included - flapping hinge offset, flapping hinge restraint, pitch-flap coupling, and blade Lock number - are known to influence the agility, stability, and operational safety of helicopters. Effects of the nonuniform downwash model of White and Blake on the blade flapping motion are examined, and the theoretical calculation is then correlated with experimental test data. The condition for achieving perfect decoupling of the flapping response due to aircraft pitch and roll rates, which was previously obtained for a hovering rotor, is evaluated in forward flight. The results show that negligible coupling is achieved in forward flight; moreover, there is the additional benefit of a slight reduction in the coupling of the roll rate to coning. It is also indicated that the values of the rotor parameters chosen according to the decoupling condition are moderate and that the flapping motion is stable with the parameters chosen. (Author)

A82-26384 **CH-46 fiberglass rotor blade repair program.** N. Caravasos (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadephia, PA, Oct. 22-24, 1980, Paper.* 8 p.

This paper discusses the importance of field repair capability of fiberglass rotor blades at the lowest maintenance level. An overview of validated repairs in a controlled environment is presented, including fatigue testing as well as actual repairs - out of the laboratory and in the field by Navy and Marine Corps mechanics. Substantial cost improvement between fiberglass and metal blades was realized because of improved reliability of fiberglass blades requiring less maintenance actions. (Author)

A82-26385 **A survey of U.S. Army helicopter main and tail rotor blade obstacle strikes.** L. T. Burrows (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 8 p.

A description is presented of the results of a survey of main and tail rotor blade obstacle strikes which resulted in damage-causing mishaps. The occurrence of the considered mishaps are partly the consequence of an increased employment of terrain flying tactics. Such tactics are necessary to improve the chances for the survival of helicopters in the mid to high intensity combat environment. In the majority of the mishaps analyzed, the objects most often struck were trees, branches, bushes, or other vegetation. The aircraft considered include the OH-58 Kiowa, the AH-1 Cobra, and the UH-1 Iroquois. Approaches to obstacle strike tolerance are also discussed. G.R.

A82-26386 **The YAH-64A composite flexbeam tail rotor.** D. Banerjee, R. E. Head, R. Marthe (Hughes Helicopters, Inc., Culver

City, CA), and M. Ploudre (U.S. Army, Manufacturing Technology Branch, St. Louis, MO). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 12 p. 9 refs.

A new composite flexbeam tail rotor is being fabricated for the YAH-64 Advanced Attack Helicopter. This rotor builds on the aerodynamic/dynamic and composites manufacturing technology which has been developed over the past several years for hingeless tail rotors. The design of a structurally and dynamically bearingless tail rotor design requires the solution of a number of problems. The problems are discussed along with the approaches developed for their solution. Attention is given to the prototype rotor, tail rotor design refinements, and manufacturing techniques. The flexbeam is considered along with the hub, the pitch case, the blade, the rotor dynamics, and certain key parameters. G.R.

A82-26387 * # **Performance improvements with the free-tip rotor.** R. H. Stroub (NASA, Ames Research Center, Moffett Field, CA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 9 p.

A new rotor configuration called the free-tip rotor was investigated for its potential to improve helicopter forward-flight performance characteristics. This rotor differs from a conventional rotor only in the blade tip region. Free tip is self-adjusting in pitch with respect to the rest of the blade. With this capability, the resulting pitch motion generated a more uniform airload distribution around the azimuth. Computer math models were used to compare performance characteristics of the free-tip rotor with those of a conventional rotor operating at flight speeds from 130 to 160 knots. The free-tip rotor is shown to improve cruise L/DE by at least 22%. (Author)

A82-26388 # **Operational experience with the fiberglass rotor blade.** R. E. Yeend (U.S. Naval Air Systems Command, Arlington, VA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 15 p.

A recently introduced fiberglass rotor blade (FRB) for the Navy/Marine Corps H-46 helicopters resulted in greatly increased mean blade flight hours between maintenance actions, removal to depot, and failure as compared to metal rotor blades. Aircraft flying qualities and performance characteristics were essentially unchanged from those obtained with metal rotor blades. No return to depot was required during reliability demonstration tests. Operational experience showed that in 82,000 total blade flight hours, involving over 500 FRB's, none had to be returned to depot for repair, compared to 464 metal blades in that time span. Of the 18 FRB's that were damaged, 15 were returned to service at the field activity level. Inherent failure that occurred in three blades is not expected to occur in production blades. Problems currently under investigation are titanium sparking during night flight, blade retention pin wear due to ingestion of sand, and corrosion of the lightning protection screen. C.D.

A82-26389 **Design of a composite main rotor blade spar for fabrication by tubular braiding.** M. L. White (Kaman Aerospace Corp., Bloomfield, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 7 p. 8 refs. Army-sponsored research.

Mechanical tubular braiding has been shown to be a viable spar manufacturing process in a program which included preliminary design of an improved main rotor blade for the OH-58 helicopter. The blade incorporates an advanced aerodynamic shape and has as its primary structural member a Kevlar 49/epoxy spar fabricated by braiding. Achievement of an analytically acceptable blade and spar design meeting critical structural and dynamic requirements was not hindered by braiding process constraints. Mechanical property tests of flat panels and spar sections exhibited excellent correlation with analytical predictions, substantiating the applicability of normal composite laminate analysis methods and the validity of the specific design. Ballistic testing of spar sections demonstrated superior containment of structural damage compared to composite spars produced by more conventional methods. Manufacturing cost estimates predict a price reduction of 1/3 for the braided spar over a similar S-glass/epoxy spar fabricated by orthodox, low-cost technology for an OH-58 blade of identical external shape. (Author)

A82-26390 **Sikorsky tail rotor - 1980: Advanced manufacturing and quality control techniques.** G. Wehnert (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 8 p.

A new lay-up design for the unidirectional graphite/epoxy spar of the tail rotor blade assembly in the Sikorsky BLACK HAWK aircraft simplifies manufacturing while changing none of the spar's physical and structural characteristics. The currently used 321 torpedo plies are replaced by 213 unidirectional one-piece plies laid up alternately at plus or minus 5 degrees to the horizontal. Spar yield is also improved by using press grade graphite with lower epoxy resin content, resulting in more uniform flow characteristics during molding. Consequently, less debulking in the thicker areas is required, porosity is reduced and the cure cycle is simplified because of more repeatable gel characteristics. The quality control employs a fully automated ultrasonic inspection and back-up inspections that distinguish between voids and inclusions on the one hand and porosity on the other with the resultant improved yield. C.D.

A82-26391 **SH-60B Seahawk automatic blade fold system.** C. V. Toner (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 11 p.

An automatic electromechanical blade fold system has been successfully tested as part of the U.S. Navy SH-60B Seahawk antisubmarine helicopter development program. Originally the blade fold systems had been hydraulically powered. However, for the SH-60B program a decision was made to change to an electrically powered system, because it promised inherently higher reliability and potentially lighter weight in a simpler system. Attention is given to system requirements, air vehicle reliability, a system definition, the blade fold, the lag dampers, aspects of pitch lock design, the blade retention bearing, the initial blade fold design, questions of blade unlocking, the fold actuator, the fold hinge detent, lock pin extraction, lock pin sequencing, and questions of fold actuator isolation. G.R.

A82-26392 **The impact of missions on the preliminary design of an ABC rotor.** G. de Simone, R. S. Blauch, and R. A. Fisher (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 19 p. 8 refs.

A number of studies have shown the suitability of the ABC rotor in a wide range of applications which require combinations of high speed flight and low speed agility and efficiency. Studies related to two of the envisaged applications are discussed. An advanced rotor has been derived for a cruise design point and a hover design point. Attempts have been made to chart the impact of airfoils, taper, and twist on the performance of an advanced rotor and a baseline XH-59A geometry rotor. Design trends using the two rotor data bases have been generated for a troop assault mission (high cruise speed requirement) and for an observation mission (high hover time required). G.R.

A82-26393 **Main rotor hub electromagnetic signature reduction.** J. Shostak (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) and J. Carver (Rockwell International Corp., Tulsa, OK). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 10 p.

A main rotor hub cover was developed to reduce the electromagnetic (EM) signatures of the Army AH-1G/S helicopters' main rotor hub. The signatures addressed in the rotor hub cover design were the radar cross section (RCS), infrared radiation (IR) and visual, with emphasis being placed on RCS reduction. A detailed discussion of the main rotor hub cover development program and its subsequent RCS testing are presented in this paper. The stated program goals established the criteria from which the hub cover evolved. Careful consideration was given to the selection of materials and the cover design for optimization of the electromagnetic signature reduction. Static RCS signature measurements were performed on the rotor hub cover as were subsequent in-flight RCS measurements on the entire helicopter equipped with and without the hub cover. The in-flight

Society for the Advancement of Material and Process Engineering, 1981, p. 134-149. Contract No. F33615-79-C-5038.

Progress towards the realization of resins for field repairs of composite materials using temperatures in the ranges 180-200 F and 300 F are reported. A low moisture absorption, two-part epoxy system with commerically available components and good environmental durability was indicated in a screening process, and the epoxy novolac, DEN 438 cured with isophorone diamine was selected for development. Although slow cure at room temperature was possible, heat curing at 160 F was investigated for rapid turnaround possibilities. High and lower temperature cure cycles with aluminum-composite double strap bonds were employed in a series of bond and strength tests. Sustained stress induced negligible reductions in bond strengths, whereas moisture absorption did cause failures at the strap surfaces. Bond strengths remained steady after 500 hr aging at 300 F. A necessity of fabricating a room temperature primer is mentioned. M.S.K.

A82-27414 **Compatibility of 350 deg curing honeycomb adhesives with phosphoric acid anodizing.** E. E. Peterson, D. B. Arnold, and M. C. Locke (Boeing Commercial Airplane Co., Seattle, WA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 177-188. 8 refs. USAF-supported research.

Results of an investigation of the relative mechanical properties and environmental durability of square edge metal/metal honeycomb bonded panels with skins processed with phosphoric acid anodize (PAA) and Forest Products Laboratory (FPL) are reported. The PAA process conditions were varied on metal-to-metal shear strength tests and environmental durability was examined, using cyclic room temperature to -67 F conditions. Peel strengths increased at low temperatures and failure analysis revealed no specimen failure interfacially between oxide and primer, while moderate to good filleting to the core enhanced peel strength. Test specimens were all aluminum alloys, and environmental failures occurred between the adhesive and the aluminum core. Finally, variation in the PAA process had negligible effect on the lap-shear strength or the fracture toughness of metal-to-metal bonded joints. M.S.K.

A82-27415 **Characterization of composition variations in a structural adhesive.** K. G. Kibler (General Dynamics Materials Research Laboratory, Fort Worth, TX). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 189-202. 7 refs. Contracts No. F33615-80-G-0007; No. F33615-80-G-0002; No. F33615-80-G-0003.

Attempts to establish correlations between compositional changes, processability, and structural-environmental performance of the 350 F cure structural adhesive RB398 are reported. The program was intended to define material acceptance specifications in terms of composition, formulation, and cure limits as part of the F-16 Technology Modernization Program. RB398 was tested in multiple variations of constituents in physiochemical, performance, and processability trials. High performance liquid chromatography was found to be a suitable method for detecting variations in organic constituents at levels which affect processing or performance. M.S.K.

A82-27423 **Composite control tubes.** S. C. Aker and W. G. O. Sonneborn (Bell Helicopter Textron, Fort Worth, TX). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 280-286.

The design and development of composite material push-pull control tubes to replace aluminum tubes in helicopter flight control systems are described. A three-year development and FAA certification program is discussed, which resulted in a weight savings for tubes of approximately 50% relative to current aluminum designs. Reliable and potentially lower cost hardware that will be fielded in the Bell Helicopter Textron Model 214ST transport helicopter has also been developed by the program. Mechanized manufacturing methods for the production of the tubes are described, and it is shown that inventory simplifications for spares can be achieved by two-piece construction of the tubes. D.L.G.

A82-27424 **The design, construction, and performance of composite fuselage components for the Boeing 234 helicopter.** L. J. Marchinski and R. L. Pinckney (Boeing Vertol Co., Philadelphia, PA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 287-297.

The design, construction and structural evaluation of the composite fuel pods for the commercial Boeing 234 helicopter are presented. The all-composite pods are attached to the airframe structure through vibration isolation devices, and are of sandwich shell design employing KEVLAR and graphite fibers. The all-composite cargo floors used in the commercial 234 are also discussed, which, along with the fuel pods, have proved to be less costly, of lower weight, and easily tailored to requirements. D.L.G.

A82-27429 **Engine industry cost considerations for emerging technologies.** M. A. Siegel (United Technologies Corp., Government Products Div., West Palm Beach, FL). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 358-363.

Aspects related to the successful implementation of new technologies in aircraft engines are examined. The present investigation assumes that the benefits other than cost have been established. The cost factors in product selection cover a wide range of influence encompassing the basic cost of the product or part, the development cost, capitalization to produce the part, and operating costs. The ability to accurately calculate these costs frequently determines acceptance of a new concept and its success in service. Attention is given to materials and processes which have paced the growth of the aircraft and aerospace industry. G.R.

A82-27430 **Manufacturing cost trade-studies in avionics.** B. R. Noton (Battelle Columbus Laboratories, Columbus, OH), J. G. Vecellio (Rockwell International Corp., Avionics and Missiles Group, Cedar Rapids, IA), and R. Remski (Honeywell, Inc., Avionics Div., Minneapolis, MN). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 364-379.

It is becoming increasingly important to arrest and reduce costs at all levels of the aircraft system life-cycle. The 'Manufacturing Cost/Design Guide' (MC/DG) Data Development Program for airframes and avionics provides an opportunity for the designer to study a larger number of alternative design configurations for airframes and avionics to achieve the lowest manufacturing cost. The MC/DG man-hour information is presented in basically three forms. These are lowest-cost processes for the designer, manufacturing methods for multiple discrete parts, and multiple manufacturing methods for single discrete parts. Attention is given to major system design parameters, MC/DG section development for electronics fabrication and assembly, electronic cost-drivers, an integrated example utilizing MC/DG formats for electronics, and fabrication and assembly cost-drivers. G.R.

A82-27432 **An evaluation of several polymers for high density humidity PC coatings.** H. E. Frankel, C. Ray, and F. P. Casto (Fairchild Space and Electronics Co., Germantown, MD). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 399-406.

In the evaluation, one of the most severe environments to which military aircraft is subjected is considered. Attention is given to rapidly changing temperatures at seacoast locations, taking into account situations in which the atmosphere may be laden with industrial or fossil fuel by-products. A urethane coating used for printed wiring boards afforded generally excellent protection. However, in connection with more stringent requirements, particularly with regard to rapidity of high-altitude, high-humidity cycling, it became clear that only either a new type of coating or a much thicker urethane coating could provide the required protection. An experiment was, therefore devised to evaluate the single parameters of imperviousness to moisture, taking into consideration six types of coating. The qualifications of the various coatings are discussed. G.R.

A82-27436 **Transition of aerospace adhesive bonding technology from R&D to operational use.** H. S. Schwartz (USAF, Materials Laboratory, Wright-Patterson AFB, OH). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 425-436. 18 refs.

A chronological review is presented of developments in the materials processes and quality assurance aspects of aerospace bonding, and the degree of success in transitioning these developments. Early applications of adhesive bonding technology in aircraft structure exploited intrinsic structural advantages, such as long fatigue life and high stiffness-to-weight ratio. High temperature polymers were later developed for use up to 700 F. Service experience in the 1960s revealed deficiencies in moisture resistance of the epoxy-based adhesive bonding technology for aluminum structures, which led to the development of high durability bonding technology for the aluminum structures in the mid-1970s. Current emphasis is on reliable performance and economical production. D.L.G.

A82-27437 **Correlation of surface characterization of phosphoric acid anodize oxide with physical properties of bonded specimens.** K. K. Knock and M. C. Locke (Boeing Co., Seattle, WA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 445-458. 6 refs.

A82-27446 **Recent developments in materials and processes for aircraft corrosion control.** S. J. Ketcham and J. J. De Luccia (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Technology transfer; Proceedings of the Thirteenth National Technical Conference, Mount Pocono, PA, October 13-15, 1981. Azusa, CA, Society for the Advancement of Material and Process Engineering, 1981, p. 571-582. 10 refs.

The subjects investigated are primarily useful in considerations related to airframes, although the results may also be applicable to electronic equipment. A number of corrosion preventive, water displacing compounds are considered, taking into account their areas of application. It is pointed out that elastomeric sealants are widely used on naval aircraft to seal out the environment. It is anticipated that the use of these sealants will increase in the future due to their ability to accommodate the dynamic loads imposed on aerospace equipment without cracking. Attention is also given to surface treatments for aluminum alloys, and aspects of alloy selection and treatment. Materials under development are related to a water displacing paint, a flexible primer, the development of an aluminum plating process, phase transfer inhibitors, crack arrestment compounds, and powder metallurgy aluminum alloys. G.R.

A82-27509 † **Problems in the automation of the thermal-stress analysis of flight vehicles (Problemy avtomatizatsii teploprochnostnykh issledovanii letatel'nykh apparatov).** I. F. Obraztsov, O. M. Alifanov, V. S. Kuznetsov, V. I. Lopatin, B. M. Pankratov, and I. M. Ukolov. In: Scientific lectures on aviation and astronautics 1980. Moscow, Izdatel'stvo Nauka, 1981, p. 100-110. In Russian.

The paper examines the development of automated data processing systems for the thermal-stress analysis of flight vehicles. A hybrid system for the automated processing of thermal-test data is described, and a block diagram of the system is presented. B.J.

A82-27526 † **Strength of the turbine components of a gas-turbine engine under complex loading and associated problems (Prochnost' detalei turbiny GTD v usloviiakh slozhnogo nagruzheniia i sviazannye s nei problemy).** N. D. Kuznetsov. *Problemy Prochnosti,* Mar. 1982, p. 10-14. In Russian.

The corrosion resistance and cyclic strength of the blading and disks of aircraft gas-turbine engines are discussed with emphasis on the effects of the fabrication and assembly process variables. The currently used methods of blading design analysis are examined and their faults are demonstrated by comparing the calculated and experimentally determined resonances of a disk. It is shown that more accurate techniques of vibration analysis can be developed on the basis of dynamic elasticity equations. V.L.

A82-27641 # **Analysis of side-looking airborne radar /SLAR/ performance in the detection of search and rescue targets.** S. R. Osmer, N. C. Edwards, Jr. (U.S. Coast Guard, Research and Development Center, Groton, CT), and G. L. Hover (Analysis and Technology, Inc., North Stonington, CT). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 803-810.

Performance detection tests were conducted on two side-looking airborne radar (SLAR) systems to determine the influence certain environment-related and controllable parameters have on SLAR detection of typical search target types. Analysis techniques consisted of binning and plotting the empirical data to compare SLAR detection performance under sets of conditions for demonstrating the influence of the parameters. Environment-related parameters found to influence performance included wind speed and precipitation, and controllable parameters included target size and composition, altitude, antenna polarization and lateral range. D.L.G.

A82-27709 **Optimal target designation techniques.** L. M. Novak (MIT, Lexington, MA). In: Asilomar Conference on Circuits, Systems and Computers, 14th, Pacific Grove, CA, November 17-19, 1980, Conference Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 108-112. 6 refs. USAF-DARPA-Army-sponsored research.

This paper presents studies of signal processing techniques for achieving optimal autonomous acquisition of stationary targets located in a moderately intense non-homogeneous radar ground clutter background. The process of target acquisition is comprised of three basic functions: (1) target detection, (2) target selection or designation, and (3) re-acquiring the target for tracking. It is the second of these functions, i.e., autonomous designation of a target, that is the subject of this paper. Theoretical analyses and predictions of the probability of correct target designation for two acquisition search methods are presented and compared with results achieved using real radar imagery. (Author)

A82-27714 * **RAMP - A fault tolerant distributed microcomputer structure for aircraft navigation and control.** W. R. Dunn (Southern Colorado, University, Pueblo, CO), J. Johnston, and G. Meyer (NASA, Ames Research Center, Moffett Field, CA). In: Asilomar Conference on Circuits, Systems and Computers, 14th, Pacific Grove, CA, November 17-19, 1980, Conference Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 280-286. 9 refs. Grant No. NAG2-2.

Design methodologies for realizing future high authority autoflight control systems are being investigated, taking into account also the study of distributed microcomputer architectures. Attention is given to the redundant asynchronous microprocessor (RAMP) structure. RAMP comprises a connected network of microcomputers which has as input command and sensor information, and which generates servo information to drive actuators, and thrust linkages. Tolerance to hardware failures is achieved by static redundancy. Results of a failed microcomputer are simply rejected. This is done in lieu of dynamic redundancy wherein the distributed computer system performs real time fault detection and reconfiguration of the system. Attention is given to the RAMP network structure and operation, flight control with parallel asynchronous computers, and intermittent fault tolerance. G.R.

A82-27869 **Applications of adaptive control systems.** P. C. Parks (Royal Military College of Science, Shrivenham, Wilts., England), W. Schaufelberger (Zürich, Eidgenössische Technische Hochschule, Zurich, Switzerland), C. Schmid, and H. Unbehauen (Bochum, Ruhr-Universität, Bochum, West Germany). In: Methods and applications in adaptive control; Proceedings of the International problem, including both off-line and on-line (recursive) algorithms; the control problem, including both open-loop and closed-loop feedback; and the various regulator configurations possible within this class. Conclusions from analysis and numerical simulations of the regulators provide guidance in the design and selection of algorithms for further development, including wind tunnel and flight tests. M.G.

HC A05/MF A01 CSCL 01/3

Frequency response matching techniques were applied to the longitudinal dynamics of five Navy tactical aircraft: the A-6, A-7, S-3, F-14 and F-18, to obtain equivalent system models of their short period response. The pitch rate transfer function was matched with a first order numerator over second order denominator equivalent system model. Freeing the numerator root (L Alpha) in the matching process resulted in large unrealistic values of the numerator term. The variation in L Alpha was reduced by simultaneously matching the pitch rate and normal acceleration transfer functions with the denominators constrained to be equal. The mismatch parameter associated with aircraft configurations which were not amenable to the first over second order equivalent models could be improved by identifying additional roots in the equivalent model. Correlation of the data with the requirements of MIL-F-8785C was straightforward for both short period damping ratio and time delay. Correlation of the frequency requirements, however, required that the control anticipation parameter definition be modified to represent the maximum rather than the initial pitch acceleration response. This report describes a method of calculating the gust sensitivity of conventional aircraft and presents gust sensitivity values for a total of 69 military and civilian aircraft. Gust sensitivity is presented in terms of the vertical load factor response of aircraft per foot per second discrete gust. The information is intended to permit organizations engaged in the forecasting of atmospheric turbulence to properly take into consideration the capability of particular aircraft to operate safely in various turbulence levels. The basis for calculating the gust sensitivity is the so called 'gust loads formula' which is a single degree of freedom mathematical model of the aircraft excited by a one-minus-cosine shaped wave form of 25 chord wave length. An empirical equation is used to calculate the aircraft normal force coefficient over the subsonic, transonic, and supersonic airspeed range. Author (GRA)

INTEGRATION OF CONTROLS AND DISPLAYS IN U.S. ARMY HELICOPTER COCKPITS
J. A. Dasaro and C. T. Elliott Nov. 1981 28 p refs
(AD-A109594; USAAVRADCOM-TR-81-E-4) Avail: NTIS
HC A03/MF A01 CSCL 01/4

The U.S. Army has embarked on a digital avionic program with the immediate goal of developing an integrated avionic system which would eliminate all dedicated communication, navigation, and identification (CNI) control and display units (CDU's) from the cockpit. The CNI equipments were viewed as a well defined set whose control and display functions could be integrated at minimal risk. The integrated CDU developed can be used to in-service or developmental aircraft to alleviate space problems, reduce pilot workload, and increase CNI capability. A four-phase effort consisting of design, hardware fabrication, system integration, and testing was established. A cockpit was synthesized for the BLACK HAWK helicopter in which all crew functions were accomplished using multifunction interactive controls and displays. The results of this effort are presented, together with the status of the hardware currently in fabrication and the Army's plans for bench and flight testing. This exploratory effort is called the Army Digital Avionic System (ADAS). GRA

A 65 hp wind tunnel with a 40 mm by 240 mm airstream is described. This wind tunnel can achieve speeds in the neighborhood of the speed of sound, both subsonic and supersonic. It is useful in studying the transonic bump technique. The test section is 600 mm long. The side walls are made of transparent glass, and both the upper and lower walls are deformable, each through the use of nine jacks with elastic sleeves. So as to avoid condensation, the airstream's temperature is stabilized by an air exchanger at the temperature of the outside air. The first results for supersonic operation, the distribution of Mach numbers within the airstream between the parallel walls, the value of the use factor, and the diffuser's efficiency are all given. This report documents the current version in the C81 family of rotorcraft flight simulation programs developed by Bell Helicopter Textron. This current version of the digital computer program is referred to as AGAP80. The accompanying program for calculating fully-coupled rotor blade mode shapes is called DNAM05, and an associated rotor wake program is called AR9102. The AGAP80 version of C81 was developed by adding some analytical features to the AGAJ76 version, and including the ability to generate Data Transfer Files for use by the File Creation Program of DATAMAP. The User's Manual, contains the detailed information necessary for setting up an input data deck and interpreting the computed data. GRA

The physiological effects of accelerated flight are considered to contain perceptual information important to vehicle control and contribute to defining flight envelopes accessible to the pilot.

As such, these effects, or acceptable surrogates thereof, must be considered for inclusion within ground-based devices designed to train pilots for their flight mission. This study investigates the physiological effects of accelerated flight within the cardiovascular musculoskeletal, visual, auditory, tactile, and respiratory systems. The study advances conceptual designs of research-oriented devices thought capable of inducing, in the unaccelerated state, the perception of accelerated flight physiological effects. The authors conclude that one of the most important effects impacting vehicle control and successful mission execution is loss of visual acuity under accelerated flight conditions and propose a dual affect matrixed liquid crystal variable transparency visor to replicate this effect. A math model to simulate the effect is also presented. The study contains a bibliography of 277 references pertinent to accelerated flight physiological effects and equivalent simulation device design. The study presents an appendix containing an annotated bibliography of 133 references. Author (GRA)

IDENTIFICATION OF MULTIVARIABLE HIGH PERFORMANCE TURBOFAN ENGINE DYNAMICS FROM CLOSED LOOP DATA

Walter Merrill 1982 16 p refs Presented at the 6th IFAC Symp. on Identification and System Parameter Estimation, Washington, D.C., 7-11 Jun. 1982
(NASA-TM-82785; E-1120; NAS 1.15:82785) Avail: NTIS HC A02/MF A01 CSCL 21E

The multivariable instrumental variable/approximate maximum likelihood (IV/AML) method or recursive time-series analysis is used to identify the multivariable (four inputs-three outputs) dynamics of the Pratt and Whitney F100 engine. A detailed nonlinear engine simulation is used to determine linear engine model structures and parameters at an operating point using open loop data. Also, the IV/AML method is used in a direct identification mode to identify models from actual closed loop engine test data. Models identified from simulated and test data are compared to determine a final model structure and parameterization that can predict engine response for a wide class of inputs. The ability of the IV/AML algorithm to identify useful dynamic models from engine test data is assessed. Author

VIBRATION OF STRUCTURES EXCITED ACOUSTICALLY

B. L. Clarkson *In* AGARD Mod. Data Anal. Tech. in Noise and Vibration Probl. Nov. 1981 p 19-37 refs

Avail: NTIS HC A08/MF A01

The analytical methods available to estimate the response of structures to vibration are developed on the assumption that the structure itself does not change the properties of the incident sound field by any feed back or flutter type mechanism. The normal mode method is used for the majority of the work to estimate the response to any sound field. Special cases considered are jet noise excitation, turbulent boundary layer pressure excitation, and a reverberant field excitation. The alternative traveling wave method is also introduced. J.D.H.

COMPUTER-PROGRAM MODEL FOR PREDICTING HORIZONTALLY AND VERTICALLY POLARIZED VLF ATMOSPHERIC RADIO NOISE AT ELEVATED RECEIVERS Final Report

Francis J. Kelly, J. P. Hauser, and F. J. Rhoads 28 Dec. 1981 22 p refs
(AD-A109446; NRL-8479) Avail: NTIS HC A02/MF A01 CSCL 20/14

A computer program was developed that can predict horizontally and vertically polarized atmospheric radio noise at any altitude or location in the Earth-ionosphere waveguide in the very-low-frequency (VLF) range from 10 to 30 kHz. The new program, HORNS, uses the outputs of two previously written programs, COMPWR and NOISLAN, which predict the vertical electric noise field at the ground. The HORNS program computes all the field components at any altitude using the vertical electric field at the Earth's surface as a basis. Predicted values from several versions of the new model were compared with presently available data. The results are encouraging, but more data are needed to test the model. GRA

TEST PLAN FOR SSR Final Report

Janis Vilcans Washington FAA Oct. 1981 143 p
(AD-A109503; FA-180-PM-81-40; DOT-FAA-RD-81-84; TSC-FAA-81-23) Avail: NTIS HC A07/MF A01 CSCL 17/9

A comprehensive test plan is presented to evaluate the impact of wind and ice loading on the rotation rate stability of a Secondary Surveillance Radar (SSR) antenna used for air traffic control surveillance. Antenna rotation rate variations may introduce errors in the estimate of a position of an intruding aircraft in a passive collision avoidance system used in conjunction with the SSR antenna. The test plan provides a method for determining the statistics of the antenna rotation rate variations. Analytical methods are then presented to assess the effects on CAS performance. The measurement system design, mathematical model development of the antenna system, test data reduction, and analysis programs are presented in detail. Sample calculations of preliminary field data are given and compared with the results obtained from computer simulations. The computer simulations are also intended to predict antenna rotation rate variations at the upper limits of the FAA specified range, which were not generally encountered during normal operations. VORTEX FLOW CORRELATION Final Report, May - Oct. 1980

Gary E. Erickson Wright-Patterson AFB, Ohio AFWAL Jan. 1981 357 p refs
(Contract F33615-80-C-3024; AF Proj. 2307)
(AD-A108725; NOR-80-152; AFWAL-TR-80-3143) Avail: NTIS HC A16/MF A01 CSCL 14/2

Key parameters have been identified which permit correlation of vortex flow simulations in a water tunnel with wind tunnel and flight data. Vortex generation, vortex sheet and core location, and a vortex strength on thin slender wings are accurately represented in a water tunnel due to the insensitivity of separation point location to changes in Reynolds number. The fact that theoretical methods which ignore viscous effects can reasonably predict vortex flow aerodynamics is one indication of the Reynolds number insensitivity of these flow phenomena. For wings and bodies where separation point varies with Reynolds number, the fundamental vortex structure is similar regardless of Reynolds number value since vortices at a distance from the generating surfaces are embedded in essentially irrotational flow. External pressure gradient is an important parameter affecting vortex stability and, although there is yet no theoretical verification that this parameter is the dominant one, vortex burst at higher angles of attack for a given configuration occurs at comparable positions in water tunnels as in wind tunnels and flight. A water tunnel is a powerful diagnostic tool capable of providing

THE APPLICATION OF SUBSONIC THEORETICAL AERODYNAMICS TO ACTIVE CONTROLS
H. C. Garner May 1981 84 p refs
(RAE-TR-81060; RAE-Struct-BF/B/0860; BR80082) Avail: NTIS HC A05/MF A01

Aerodynamic forces for wing and control surface motion with general time dependence in linearized subsonic flow were analyzed. The time domain where quasisteady displacement and rate terms are combined with a residual history term is discussed. An accurate calculation procedure is devised, and results are illustrated for a high respect ratio wing at Mach number 0.8 with trailing edge, leading edge and all moving tip controls. Asymptotic behavior at small and large times and individual control characteristics are compared. The quasisteady approximation is established for hinge moments and is analyzed for lift. The rapid lift response to leading edge control and the sluggish lift response to trailing edge control are explained. The forces in the time domain are confirmed by Fourier transform calculations in the frequency domain, which shows the extent to which the range of frequency can be truncated. The control surface motion to produce a known time dependent force is determined. Author (ESA)

THEORETICAL LINEAR APPROACH TO THE COMBINED MAN-MANIPULATION SYSTEM IN MANUAL CONTROL OF AN AIRCRAFT
Klaus Brauser 2 Jun. 1981 17 p refs Presented at 17th Ann. Conf. on Manual Control, Los Angeles, 16-18 Jun. 1981
(MBB-FE-301/S/PUB/43) Avail: NTIS HC A02/MF A01

The dynamic characteristics of the pilot control system are studied with a model combining the neuromuscular properties of the man with the physical properties of the control system. The man is assumed to be a quasilinear, time invariant control operator adapted to the operating states of the control system. The frequency domain transfer functions of the man control system and the closed loop pilot aircraft control system are posed. The complete precision man control model must be introduced into the closed loop transfer function to understand standard handling criteria and to derive these criteria directly from human operator properties. These proceedings are a collection of papers presented at the 1981 Image Generation/Display Conference 2. The Image Conference is devoted to issues relevant to the development and use of imagery generated and displayed for visual flight simulation. The purpose of the conference is to provide a forum for presenting and discussing topics concerned with the imagery generated for out of the cockpit and sensor visual flight simulation. The 31 papers presented were compatible with the theme of the conference, including both engineering research/development and behavioral research. In the engineering area, papers covered such topics as computer simulated forward looking infrared and low light level television imagery, computer image generation (CIG) texturing of curved surfaces, shuttle mission simulation, nap of the Earth flight simulation, light valve projectors, lasers in simulation, area of interest displays, tactical combat simulation, sensor simulation, and helmet-mounted displays. Topics in behavioral research included such items as effects of visual and motion cues, identification of targets in CIG displays, psychophysical aspects of visual processing, visual illusions, visually induced self motion, determination of visual cue requirements, visual data base development for terrain flight simulation, transformation realism, and strategies to optimize CIG image content. OVERVIEW OF THE O'HARE RUNWAY CONFIGURATION MANAGEMENT SYSTEM
Richard L. Fain Sep. 1981 52 p refs
(Contract DTFA01-81-C-10001)
(AD-A110137; MTR-81W235; FAA-EM-82-5) Avail: NTIS HC A04/MF A01 CSCL 17/7

The O'Hare Runway Configuration Management System (CMS) is an interactive computer algorithm designed to assist the Assistant Chief of the O'Hare facility in selecting runway configurations which minimize delay. The current version of CMS utilizes a full screen input/output structure to enhance near-term implementation within O'Hare's manual ATC environment. This paper presents an overview of the runway selection logic (including the impacts of transitioning between configurations and balancing demand) and describes the system hardware configuration and the functional responsibilities of the participants in the O'Hare application. The historical development of CMS, future potential enhancements in system logic and system implementation, and application of CMS at other airports are also discussed. Author (GRA)

THEORETICAL AND EXPERIMENTAL INVESTIGATIONS OF WIND TUNNEL INTERFERENCE DUE TO ANGLE OF ATTACK
Norbert Gruen 29 Aug. 1980 145 p In GERMAN; ENGLISH summary
(MBB-FE-124/S/PUB/34) Avail: NTIS HC A07/MF A01

Using wall pressure measurements, recorded simultaneously with model tests, corrections for model surface pressures are calculated. The difference between experimental wall pressure coefficients and computed free flight pressure coefficient distributions is used as a criterion for the wall interference on the tunnel flow. An evaluation of the wall pressure curves shows that their general shape is predetermined by the empty tunnel and the model support, respectively. Increasing the model angle of attack primarily causes a shift and a change in the gradient of these curves. The calculated free flight pressure coefficients are found to be very small compared to measured values. In order to find the pressure coefficient differences along the tunnel axis, a flow model is established which shows the previously computed differences in pressure coefficients on an imaginary wall at the location of the tunnel wall. The propagation of these disturbances to the tunnel axis is calculated using the finite element method. Results are used to correct measured coefficients for lift, drag and pitching moment. COMPUTER GENERATED IMAGES FOR AIRCRAFT PILOT TRAINING
P. Gueldenpfennig and W. Matze 3 Nov. 1980 19 p refs
(MBB-UA-551/80-OE) Avail: NTIS HC A02/MF A01

The various training tasks envisaged for full mission simulation with a prototype visual system are described and the performance of the system evaluated. The upgrading of the system resulting from this evaluation, and its implementation in the operational simulators, are discussed. Deficiencies were noted in the following areas: scene content due to the limited real time edge processing capability, for the training of ground attack, and takeoff/landing; scene content due to the limited online data base for the training of en route flying; and resolution due to the number of TV lines and raster elements per TV line for the training of ground attack and air-to-air-combat. TELEMETRY IN AERO ENGINE DEVELOPMENT
A. E. Hubble 1980 19 p
(PNR-90055) Avail: NTIS HC A02/MF A01

The use of an Acurex telemetry system for obtaining in situ strain and temperature measurements of a high pressure compressor rotor disk is described. The transmitter is mounted inside the compressor shaft with an auxiliary supply of cooling air. Calibration techniques of the strain gages, transmitter and receivers are given. Procedures used for selective test bed transmitter frequencies are listed. Laboratory test results for the thermocouple and static strain transmitters show good agreement with manufacturers' data. A comparison with similar battery operated equipment is made. Author (ESA)

ADVANCED CONCEPTS FOR COMPOSITE STRUCTURE JOINTS AND ATTACHMENT FITTINGS. VOLUME 1: DESIGN AND EVALUATION Final Report, Jul. 1977 - Dec. 1980
J. V. Alexander and R. H. Messinger Nov. 1981 127 p refs 2 Vol.
(Contract DAAJ02-77-C-0076; DA Proj. 1L2-62209-AH-76)
(AD-A110212; HH-80-402-Vol-1; USAAVRADCOM-TR-81-D-21A) Avail: NTIS HC A07/MF A01 CSCL 01/3

The purpose of this program was to develop the technology of applying fiber-reinforced composite materials to helicopter joints and attachment fittings that permit disassembly of major components. A generic design methodology approach was used to make the data developed applicable to ongoing and future helicopter programs. A detail design, analysis, and testing program was carried out on the three joint and fitting concepts selected: wrapped tension fittings, gearbox attachment fittings, and seat attachment fittings. The scope of the study included analytical design tools, including finite element computer analysis; fabrication techniques, with special emphasis on weight and cost effectiveness considerations; structural integrity testing, including static, dynamic, failsafe/safe-life, and ballistic tolerance considerations; and nondestructive inspection (NDI) techniques. Author (GRA)

ANALYSIS OF VERY LOW FREQUENCY OSCILLATIONS IN A RAMJET COMBUSTOR BY USE OF A SENSITIVE TIME LAG MODEL
In APL The 18th JANNAF Combust. Meeting, Vol. 3 Oct. 1981 p 307-319 refs
(Contract F33615-77-C-2004)
Avail: NTIS HC A20 CSCL 21/9

Pressure oscillations in ramjet combustor were investigated. Coaxial dump combustor configurations and on very low frequency oscillations, oscillations in which the acoustic modes of the combustion chamber are not excited was emphasized. The main features of the analysis are: compressible flow in the air inlet system, bulk oscillations in the combustor, and a combustion response characterized by a time lag sensitive to combustor conditions. Two studies were undertaken by using the analytical model: (1) an empirical correlation for the time lag based on steady state performance data was used; (2) consisted of the calculation of stability limits for the time lag and combustor geometry for various sets of operating conditions. Comparison of the analytical stability limits with the experimental results gave time lag values, which are compared with the empirical correlation used in the first study. E.A.K.

FACTORS INFLUENCING VELOCITY DISTRIBUTIONS AT INLET/COMBUSTOR INTERFACES
M. Sajben, T. J. Bogar, J. C. Kroutil, and J. T. Salmon *In* APL The 18th JANNAF Combust. Meeting, Vol. 3 Oct. 1981 p 321-331 refs
(Contract F49720-77-C-0082)
Avail: NTIS HC A20 CSCL 21/9

Flows in six nominally two dimensional, supercritical diffusers, to highlight the effects of selected parameters and operating conditions on the velocity distributions at the downstream end are reviewed. The state of the flow at this location has a significant influence on the performance and stability of liquid fuel ramjet burners. The investigated parameters include the diffuser exit area/throat area ratio, the terminal shock strength and the boundary layer thickness before the throat. The terminal shock strength was found to be a major factor. Initial boundary layer thickness had only moderate effects on the efflux conditions. It is suggested that methodology developed for assuring inlet engine compatibility in turbojet propulsion systems could be modified to aid ramjet development. E.A.K.

REPORT OF THE JANNAF WORKSHOP ON HIGH FREQUENCY INSTRUMENTATION AND DATA ANALYSIS TECHNIQUES
P. A. Chun (Naval Weapons Center, China Lake, Calif.) and R. S. Brown *In* APL The 18th JANNAF Combust. Meeting, Vol. 3 Oct. 1981 p 333-339 refs Conf. held in New Orleans, 28-29 May 1981
Avail: NTIS HC A20 CSCL 21/9

Pressure oscillations in ramjet combustor, instabilities and transients in ramjet engines and facilities were discussed. The development of ramjets and ramrockets and experience with pressure oscillations in other airborne propulsion systems is examined. Current high frequency instrumentation methods and data analysis practices are reviewed. Guidelines for the consistent and proper use of high frequency response instrumentation on ramjet engine and component testing and data acquisition, recording, analysis, and interpretation techniques are considered. Procedures are presented for obtaining consistent, useful, and repeatable pressure oscillation data. E.A.K.

THE EFFECT OF FUEL COMPOSITION ON GROUNDFALL FROM AIRCRAFT FUEL JETTISONING Final Report, Mar. 1980 - Feb. 1981
Harvey J. Clewell, III Mar. 1981 35 p refs
(AF Proj. 1900)
(AD-A110306; AFESC/ESL-TR-81-13) Avail: NTIS HC A03/MF A01 CSCL 01/3

A computer model which simulates the evaporation and free-fall of fuel droplets in the atmosphere was used to determine the effect of fuel composition on the nature and extent of ground contamination by fuel discharged from an aircraft in flight. Three fuel compositions were used: (1) JP-4, the standard Air Force jet fuel; (2) Jet A (JP-8), the standard U.S. commercial jet fuel; and (3) Number 2 Diesel Fuel, representing the upper limit for future, broadened-specification fuels from alternative sources. The results of this study indicate that the amount of liquid fuel reaching the ground from the jettisoning of commercial jet fuels is much greater than for JP-4. Moreover, future broadened specification fuels may produce even greater ground contamination when jettisoned. GRA

measurements were made on an Army AH-1S (production) helicopter whose main rotor system was the same as that of the AH-1G helicopter. (Author)

A82-26394 * **Evaluation of the effect of elastomeric damping material on the stability of a bearingless main rotor system.** M. Sheffler, J. Staley (Boeing Vertol Co., Philadelphia, PA), and W. Warmbrodt (NASA, Ames Research Center, Moffett Field, CA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 9 p. 9 refs.

The considered investigation was conducted in connection with a contract to design, fabricate, and test a prototype bearingless main rotor (BMR) system. Part of the design process involved an aeroelastic stability investigation in a wind tunnel. Attention is given to a description of model testing, model test results, the description of the full scale wind tunnel configuration, full scale test results, and aspects of correlation with theory. It was found that the complex geometry of the BMR, with 12.5 degrees of nose-up prepitch at the hub and 2.5 degrees of tip-up predroop at the blade attachment clevis, is required to achieve a stable configuration. Subsequent model testing showed that a constrained layer of elastomer material could increase stability at all rotor speeds and collectives tested for a flat strap configuration. G.R.

A82-26395 **Rotor preliminary design trade-offs for the Advanced Scout Helicopter.** M. P. Scully and R. A. Shinn (U.S. Army, Research and Technology Laboratories, Moffett Field, CA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 21 p.

A description is presented of the Advanced Scout Helicopter (ASH) main rotor design trade-offs required for the selection of rotor diameter, tip speed, blade chord, number of blades, and blade inertia. The rotor design process is a constrained optimization in which both the objective function and the constraints are complicated, nonlinear, and negotiable. The rotor design portion of ASH studies demonstrates the effect of constraints such as autorotation and survivable chord on the design, and shows the importance of developing more realistic versions of these constraints. Attention is given to design objectives, aspects of methodology, design constraints, baseline configurations, and questions of rotor and engine sizing. G.R.

A82-26396 **Performance and aeroelastic tradeoffs on recent rotor blade designs.** D. P. Schrage and J. A. O'Malley (U.S. Army, Development and Qualification Directorate, St. Louis, MO). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 11 p. 15 refs.

A review is conducted of the performance and aeroelastic requirements of a helicopter rotor blade in both hover and forward flight. It is found that aeroelastic simplifications in rotor blade design are no longer practical if optimal performance is to be achieved. It is necessary to consider airfoil geometric variations. The influence of these variations on drag divergence Mach number at lift coefficients from near zero to near maximum lift and on pitching moments must be properly addressed during the design process. Blade torsional frequency, torsional stiffness, and section pitching moment, are exceedingly important parameters in optimizing performance and control loads. These parameters must, therefore, be adequately represented in analytical models. G.R.

A82-26397 **CH-47 fiberglass rotor blade design and fabrication.** R. W. Sandford and R. P. Belko (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 11 p.

A fiberglass rotor blade for the CH-47 Chinook helicopter is now in production. It provides interchangeability, improved performance, failsafe construction, minimum inspection and maintenance requirements, maximum field repairability, and 3600 hours depot level reliability. A composite design optimizes blade geometry and features unidirectional material, titanium nosecap, and a unit-fabricated fairing of fiberglass surrounding a nonmetallic honeycomb core. The stainless-steel lag damper bracket is overwound with prestressed fibers. Bench tests were conducted to ensure against buckling of the spar wall and trailing edge, and to evaluate fatigue of the root ends with results showing that the fatigue life objective would be met. Whirl and flight tests confirmed that the blade fiberglass components, damper bracket and windings have essentially unlimited fatigue life. The titanium nosecap fatigue life substantially exceeded the design objective. C.D.

A82-26398 **Black Hawk rotor de-icing.** J. R. Reilly (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 10 p.

The U.S. Army Black Hawk helicopter is designed to operate in moderate icing conditions. Heating is provided at the engine inlets by engine bleed air and by electrothermal anti-icing elements in the windshield and pitot head. The rotor de-icing system melts the bonding layer of accreted ice, allowing the rest to be shed. A blade heating mat that carries current is integrally built within the leading edge and shielded by dielectric layers. The blades are connected to a distributor which connects to the rotor, which in turn connects to the de-ice controller and detectors. In operation, an off-time heater element responds to a predetermined accumulation of ice by commanding the on-time heater element, which operates until a predetermined ambient temperature is attained. Feedback systems monitor heat distribution and guard against excess current and blade overheating. To conserve power, the two sets of opposing blades are alternately de-iced. In tests, the system consistently produced clean ice shedding over thirty hours of testing. C.D.

A82-26399 **Design optimization of rotor systems for tilt-rotor aircraft that fold for shipboard compatibility.** R. R. Pruyn and R. B. Shannon (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 20 p.

Preliminary design studies have identified the best design concepts for four-bladed prop-rotors that must fold for shipboard compatibility. All practical combinations of folding method and hub configuration were evaluated for operational suitability, maintainability, reliability, cost, and developmental risk. Results show that the scissors-folding hingeless rotor is best if the aircraft configuration can accept a prop-rotor folding length of the prop-rotor diameter. For an aircraft configuration that requires the prop-rotor to fold to a length of approximately the rotor radius, a flexure and elastomeric articulated hub is the best choice. (Author)

A82-26400 **The Circulation Control Rotor /CCR/ control system.** D. R. Barnes (Kaman Aerospace Corp., Bloomfield, CT). *American Helicopter Society, National Specialists Meeting on Rotor System Design, Philadelphia, PA, Oct. 22-24, 1980, Paper.* 10 p. 8 refs.

This paper presents an overview of the XH-2/CCR, Circulation Control Rotor Flight Demonstrator, control system design. The circulation control rotor is a major departure from conventional rotor systems and presents the control system designer with both a new set of options and a new set of challenges. The paper emphasizes the CCR unique components and aspects of the control system. Component selection, sizing, integration and operation are addressed. Specific details of the XH-2/CCR control system are presented. Multicyclic control capability is included. (Author)

A82-26401 # **Mach 2.0 rotating arm rain erosion test apparatus.** K. W. Foulke (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings. Atlanta, GA, Georgia Institute of Technology, 1980, p. 61-70.

In studies of radome erosion damage involving aircraft operating in Southeast Asia, it was found that the materials, coatings and designs in use could not withstand such an environment. In connection with a search for improved designs and materials, a survey of possible test methods was conducted. It was concluded that a rotating arm would provide the best laboratory simulation of the environment for investigating rain erosion at subsonic and supersonic speeds. The rotating arm offered the advantages of multiple drop impact, sustained exposure time, test samples of acceptable size, low development cost, and reasonable cost per data point for test velocities to Mach 2.0. The rain erosion test apparatus consists of a four-foot radius arm rotating in a steel chamber 10 feet in diameter. G.R.

A82-26462 # Effects of filler materials upon radome rain erosion performance at subsonic conditions. E. Greene (IBM Corp., Owego, NY). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings.
Atlanta, GA, Georgia Institute of Technology, 1980, p. 71-75.

The considered investigation was initiated after premature blistering of the rain erosion coating and radome soft spots were found to occur on some near sonic speed aircraft after relatively low flight time through rain. A rotating arm rain impact test facility was used as the vehicle simulator in the investigation. Attention is given to the results from three series of rain impact tests. It was found that filler materials used between rain erosion coating and radome substrate may conceal surface blemishes or irregularities and provide an attractive surface appearance. However, the tests show that radome performance can be severely degraded in a rain impact environment. G.R.

A82-26464 # Radome rain damage - An environmental analysis technique. B. J. Crowe (Flight Systems, Inc., Newport Beach, CA). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings.
Atlanta, GA, Georgia Institute of Technology, 1980, p. 86-92. 6 refs. Contracts No. F33615-79-C-5036; No. N60530-79-C-0058; No. N00123-79-C-1042.

An environmental analysis technique has been developed for the rapid evaluation of path-cumulative rainfall statistics. Although the analysis assumes intense rainfall concentrations, the results it produces appear to be similar to those for more uniformly distributed rainfall. The accuracy of the technique is somewhat dependent on the character of the storm distribution models assumed, but parametric analyses have enhanced confidence in the general validity of the results to date. With further refinement, and improvements in the data base, it is believed that the considered approach could provide a much needed means for quantitatively evaluating the rain environment limitations of tactical missile radomes. G.R.

A82-26465 # Radome aerodynamic heating effects on boresight error. L. B. Weckesser (Johns Hopkins University, Laurel, MD). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings. Atlanta, GA, Georgia Institute of Technology, 1980, p. 97-101.

Previous studies have shown that aeroheating of a Pyroceram 9606 radome to temperatures as low as 600 F could cause a large enough change in the RF performance of the radome to affect missile performance. The decision was, therefore, made to carry out an experiment in which direct boresight error (BSE) measurements of a heated radome would be obtained. A description is presented of the special radome/antenna support fixture designed and built specifically for this test program. Attention is also given to aspects of general test arrangement, the radome, the test temperatures, and BSE results. G.R.

A82-26467 # Full scale test facilities for radomes and antenna windows. A. Ossin and H. J. Readey, Jr. (Martin Marietta Aerospace, Orlando, FL). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings.
Atlanta, GA, Georgia Institute of Technology, 1980, p. 107-111.

The CONFLOW and Ramburner test facilities, with newly added capability, will provide a variety of environments and capabilities for the aerothermal and electrical evaluation of full-up radome structures, antenna windows, and material screening. The CONFLOW facility is a computer-controlled, continuous flow, hot air generator. A description is given of an investigation which shows that measurements of radome boresight error can be made at the CONFLOW facility with sufficient accuracy for most known applications of interest, provided the seeker under test can be sufficiently isolated from CONFLOW-induced movement. G.R.

A82-26469 # Duplication of radome aerodynamic heating using the Central Receiver Test Facility solar furnace. R. K. Frazer (Johns Hopkins University, Laurel, MD). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings. Atlanta, GA, Georgia Institute of Technology, 1980, p. 112-116. 5 refs.

An experiment has been conducted that used the solar furnace at the Central Receiver Test Facility (CRTF) in Albuquerque, NM, to create flight-like temperatures in three supersonic missile radomes. The radomes tested have a von Karman profile, are made of Pyroceram 9606 about 0.25 in. thick, and have a fineness ratio of 2.1 with a base diameter of 13.5 in. The purpose of this effort was to measure the changes in radome boresight error (BSE) caused by aerodynamic heating. This paper describes the thermal aspects of the experiment, including the facility selection, heat flux survey measurements, temperature measurements made on a calibration radome, and calibration of optical pyrometers. (Author)

A82-26470 # F-5 Shark Nose Radome - A development overview. G. W. Scott. In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings.
Atlanta, GA, Georgia Institute of Technology, 1980, p. 128-133.

It is pointed out that the Shark Nose Radome, with its pronounced ellipticity and sharp discontinuity edges on the forward region, gave rise to complex interrelationships between materials, structure, mechanical design, manufacturing process, environmental evaluation, and electromagnetic performance. Because of this, the development and test phases required many iterations, trade-offs, and compromises. Extensive ground and flight tests were carried out. The production model was found to satisfy all specifications and is now being installed on production F-5 aircraft. C.R.

A82-26471 # Automated radome performance evaluation in the Radio Frequency Simulation System /RFSS/ facility at MICOM. J. M. Schuchardt, D. J. Kozakoff, D. O. Gallentine, T. N. Long (Georgia Institute of Technology, Atlanta, GA), M. M. Hallum, and B. F. Wilson (U.S. Army, System Simulation and Development Directorate, Redstone Arsenal, AL). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings.
Atlanta, GA, Georgia Institute of Technology, 1980, p. 134-141. 8 refs.

The need for rapid collection of missile radome/seeker interaction data in the U.S. Army RFSS facility has led to the development of an instrumentation system by the Georgia Institute of Technology. The system consists of a microcomputer-controlled radome positioner and radome measurements receiver. The positioner can handle radomes with diameters up to 18.0 inches and weights up to approximately 50 pounds. The receiver system operates over an RF frequency range of 0.11-18.0 GHz. A microcomputer system featuring dual floppy disk data storage furnishes a method of intermediate test data storage/buffering. Tests carried out with an actual radome/seeker antenna combination demonstrate the signal processing feature of the receiver's microcomputer. C.R.

A82-26479 † The relative motion of a particle in the case of exponential changes of the velocity of the medium (Ob otnositel'nom dvizhenii chastitsy pri eksponentsial'nom izmenenii skorosti sredy). S. V. Ananikov and B. M. Azizov. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 3-6. 13 refs. In Russian.

An analytic solution, expressed by elementary and special functions, is obtained for the relative motion of a particle in a gas flow whose velocity changes exponentially. The case of a single spherical particle in an isothermal gas flow is examined. The analysis is pertinent to the study of combustion processes in jet engines. B.J.

A82-26483 † The effect of the shape of a body on the efficiency of its utilization as a flame stabilizer (Vliianie formy tela na effektivnost' ego ispol'zovaniia v kachestve stabilizatora plameni). V. N. Gruzdev, M. M. Nuriev, and A. V. Talantov. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 43-47. In Russian.

Experimental results are presented on flame stabilizers of various shapes with regard to combustion efficiency, flameout limits, and hydraulic resistance. It is found that the replacement of the

Symposium, Bochum, West Germany, March 20, 21, 1980. Berlin, Springer-Verlag, 1980, p. 161-198. 112 refs.

It is shown through a study of adaptive control applications in the fields of aircraft control systems, industrial process control and electrical drives that, despite the advantages of their sophisticated algorithms, adaptive controls will not be adopted until they are demonstrated to be far superior to classical control techniques. The most successful field of application for adaptive controls has been that of electrical drives, since their system equations and dynamics are well understood and have parasitical vibration modes of high frequency, which can be more easily eliminated in the design process than those encountered in aircraft control. Attention is given to the causes for process industry resistance to adaptive control development, including the complicated dynamic behavior of processes under internal and external disturbances, drifts and parameter changes. O.C.

A82-27876 **AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings.** Conference sponsored by the Institute of Electrical and Electronics Engineers. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. 343 p. Members, $22.50; nonmembers, $30.

Topics considered include TPS management, ATE hardware systems, testing of the next generation commercial airline avionics, testability and built-in test, digital ATG, management information systems for ATE, and propulsion ATE. Attention is also given to system architecture, modular ATE, analog ATE, supporting shipboard electronics, and new and unusual ATE applications. B.J.

A82-27883 **Airline maintenance strategy.** W. Brouwer (KLM Royal Dutch Airlines, Engineering and Maintenance Div., Schiphol Airport, Netherlands). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 38-42.

Problems associated with the maintenance of avionics are discussed, with attention given to the consequences of increases in complexity and reliability, maintenance shop organization, and the role of the technician. The efficiency of LRU removals, the use of automatic test equipment, and the role of software are examined. B.J.

A82-27884 **Airline ATE requirements.** H. E. Harmon (American Airlines, Inc., Dallas, TX). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 43-46.

The general requirements of airline ATE (automatic test equipment) are reviewed, and attention is given to dedicated, modular, general-purpose, and circuit-card ATE. It is noted that maintenance of all-digital avionics will require the full utilization of standardized instrument techniques and the ATLAS test language to accomplish cost effective testing and repair. And it is recommended that airlines effectively communicate these test equipment requirements to the suppliers of future avionics equipment. B.J.

A82-27885 **The role of software in commercial ATE.** G. M. Jenkins (Boeing Computer Services Co., Seattle, WA). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 47-50.

The paper examines the role of software in some specific applications of commercial ATE (automatic test equipment) to the testing of avionics in commercial aircraft. The systems and software used in the Boeing Electronics Test Shop to test units for use in the 707, 727, and 737 aircraft are described. In addition, a new Air Data Computer test station is discussed along with the future use of ATLAS. The role of the software in these systems is considered. B.J.

A82-27886 **The modular ATE.** E. I. Levy (Eastern Air Lines, Inc., Miami, FL). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 51-53.

The Eastern Air Lines concept of modular ATE is presented, with attention given to both hardware and software aspects. Existing maintenance philosophies and the classical ATE are reviewed to show why present concepts are no longer cost effective. Potential problems of the modular ATE concept are examined, and the need for further standardization and close industry cooperation is discussed. B.J.

A82-27887 # **AEWTS - Realistic not futuristic.** D. D. Banks (U.S. Navy, Pacific Missile Test Center, Point Mugu, CA) and D. O. Jacoby (U.S. Naval Air Systems Command, Washington, DC). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 54-59.

The Advanced Electronic Warfare Test Set (AEWTS) program is described, with attention given to AEWTS design considerations, the dual port testing concept, and the operator interface. Phase I studies indicate that AEWTS technical requirements are achievable; in particular it is found that the dual port testing concept is not only realistic and feasible but also cost effective in terms of throughput efficiency. B.J.

A82-27890 # **ATE logistics in the United States Air Force.** R. H. Freeman (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 79-83.

It is noted that the problems and complexities of ATE (automatic test equipment) have a dollar and mission impact that now demands visibility from all levels of USAF management. Several solutions have been proposed to minimize these difficulties. One of the more promising solutions is MATE (Modular Automatic Test Equipment), a cradle-to-grave acquisition methodology approach to ATE. A second solution is to reduce the requirement for ATE by changing USAF maintenance concepts. Both solutions are being actively considered within the USAF for implementation. B.J.

A82-27891 **ATLAS/test data provision for the Tornado ATS - A challenging task.** H. Scheibenzuber (Elektronik-System-Gesellschaft mbH, Munich, West Germany). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 84-89.

The provisions of the ATLAS test specifications/test data for the Line Replaceable Units (LRUs) allocated to the Tornado aircraft Automatic Test System (ATS) are an important part in the development of the maintenance support system of the aircraft. The basic ATLAS/test data requirements include a standard serviceability test and a diagnostic test. LRU test data sheets form the baseline for ATS design and development and consist of four parts: an introduction, LRU test specifications, LRU specific requirements, and LRU interface requirements. The validation of the data is done by checking applicability, structure, syntax and lexicon, compatibility, logic, and diagnostic capability. Engineering support provided includes provision of test sheets, flow charts, and specifications. C.D.

A82-27892 # **Naval Air Systems Command /NAVAIR/ ATE program - Standardized ATE for the carrier environment.** A. W. Rossiter (U.S. Naval Air Systems Command, Washington, DC). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 90-95.

It is pointed out that the principal avionics support equipment goal of the Naval Air Systems Command has been, and remains, to provide timely and effective organic support capability to optimize U.S. aircraft weapon system readiness. A definition is provided of an Automatic Test Equipment (ATE) program that will optimize the avionic repair capability of the shipboard Aircraft Intermediate Maintenance Department. Attention is given to four factors which illustrate the unique nature of carrier support, and the ATE program plan is discussed. The Family of Common ATE is considered, taking into account aspects of general avionics support, inertial navigation system support, electro-optical support, and electronic warfare system support. A Consolidated Support System to meet the advanced support needs of the 1990's is also examined. G.R.

A82-27893 **Configuration management techniques for automatic testing.** R. W. Tobias, G. D. Scherer, and W. H. Kraper (AAI Corp., Baltimore, MD). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 99-104.

The configuration management process as it relates to automatic testing is discussed with reference to a process developed for an automatic test system supporting the P3 ORION long-range patrol aircraft. Attention is given to problems involved in the control of the hardware and software of the three key items: the automatic test system, the unit under test, and the test program test. It is emphasized that the configuration management process relating to each of these three items is critical to the overall success of the maintenance and support process. V.L.

A82-27903 **Pacer Comet II jet engine test system.** A. M. Bishop (Control Data Corp., Professional Services Div., San Antonio, TX). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 199-202.

The ten year evolution of the Pacer Comet system has produced a versatile, 'full-authority', minicomputer based test system which simultaneously controls engine testing in four test cells. This fully automated test system is operational at Kelly, Tinker and Edwards Air Force Bases. The hardware and software evolution are described with particular emphasis on the lessons learned. It will also describe the present software structure, engine test supervisor, interface between executive and UUT software, and the operator interface. Concluding remarks address the human engineering aspect of automation. (Author)

A82-27904 **The United States Air Force Automated Vibration Diagnostics System /AVID/ for improved jet engine maintenance.** R. A. Rio (Mechanical Technology, Inc., Latham, NY). In: AUTOTESTCON '80; International Automatic Testing Conference, Washington, DC, November 2-5, 1980, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 203-208.

This paper describes the successful application of an Automated Vibration Diagnostic System (AVID) in the U.S. Air Force's high-volume engine overhaul center at Tinker Air Force Base, OK. The AVID concept to automate troubleshooting procedures for fully-assembled rebuilt engines is addressed. This system extracts high-frequency vibration data from existing standard instrumentation, thereby providing meaningful mechanical information. A growing appreciation on the part of engine overhaul personnel of the power of automated test equipment has enabled these key features to be combined to reduce operating expenses at engine rebuild facilities. (Author)

A82-27920 # **Aerial combat simulation in the U.S. Air Force.** P. A. Cook (USAF, Human Resources Laboratory, Williams AFB, AZ). In: Computer Graphics Symposium, Phoenix, AZ, April 24, 1982, Proceedings. New York, American Institute of Aeronautics and Astronautics, 1982, p. 16-19.

The history, current applications, research programs, and features of future air combat simulators for pilot training are reviewed. The Link system, invented in 1929, provided good cockpit orientation and instrumentation instruction. Current Air Force simulators, specifically those located in Phoenix, AZ, are mounted on six-degrees-of-freedom motion simulators. Seven visual display screens provide a 300 x 140 deg horizontal by vertical field of view, and are configured for A-10 and F-16 fighters. Experiments with pilots trained in simulators and in classrooms for strafing and air-to-ground bombing missions have demonstrated that simulator trained pilots are more proficient in real flights past the seventh mission. Improvements in full combat simulation are reviewed, noting that human eyes are still keener than raster scans, and techniques for improving resolution and developing multiple interactive cockpits are outlined. M.S.K.

A82-27946 **Corona and antenna effects on the RH-53D minesweeping helicopter and Raydist navigation set.** J. F. Shaeffer, L. N. Medgyesi-Mitschang (McDonnell Douglas Research Laboratories, St. Louis, MO), J. W. Weber, S. R. Jacobs (McDonnell Aircraft Co., St. Louis, MO), and P. Eisenhauer (U.S. Navy, Naval Coastal Systems Center, Panama City, FL). In: International Symposium on Electromagnetic Compatibility, Baltimore, MD, October 7-9, 1980, Symposium Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 254-264. 11 refs. Contract No. N61339-77-C-0094.

A series of flight and bench tests have been carried out in order to determine the origin of interference effects on the Raydist navigation system of the Navy RH-53D minesweeping helicopter during the streaming, towing, and recovery of the minesweeping gear. Two distinct mechanisms have been identified by which the tow cable can cause unwanted effects on the navigation system: (1) a negative corona discharge (Trichel pulses) from the tow cable caused by electrification of the helicopter in the streaming and recovery modes; and (2) interaction of the monopole antenna with the tow cable in the towing mode. V.L.

A82-28016 † **Analysis of the temperature field of a baffle-cooled gas-turbine-engine blade under conjugated boundary conditions (Raschet temperaturnogo polia okhlazhdaemoi deflektornoi lopatki GTU pri sopriazhennykh granichnykh usloviiakh).** Iu. I. Shvets, A. Sh. Dorfman, O. I. Didenko, and O. D. Lipovetskaia (Akademiia Nauk Ukrainskoi SSR, Institut Tekhnicheskoi Teplofiziki, Kiev, Ukrainian SSR). *Promyshlennaia Teplotekhnika*, vol. 4, Mar.-Apr. 1982, p. 9-14. In Russian.

A high-accuracy method is developed for calculating gas-blade heat transfer coefficients and temperature fields of baffle-cooled gas-turbine-engine blades under conjugated boundary conditions. An example of such calculation is discussed, and it is shown that at some points of the blade the heat transfer coefficients obtained with this method can differ by 40% from coefficients obtained by conventional calculation methods. B.J.

A82-28018 † **Investigation of heat transfer in the vicinity of the leading and trailing edges of a cooled nozzle blade of a low-consuming gas turbine (Issledovanie teploobmena v zone vkhodnoi i vykhodnoi kromok okhlazhdaemoi soplovoi lopatki maloraskhodnoi gazovoi turbiny).** Iu. S. Osherov (Nauchno-Proizvodstvennoe Ob'edinenie, Proletarskii Zavod, Leningrad, USSR). *Promyshlennaia Teplotekhnika*, vol. 4, Mar.-Apr. 1982, p. 34-37. 5 refs. In Russian.

Electrocalorimetry was used to study heat transfer near the leading and trailing edges of a cooled nozzle blade of a low-consuming gas turbine. Relationships are obtained for determining the mean and local values of heat transfer coefficients. The results are pertinent to the development of a cooling method for regions near the leading and trailing edges of nozzle blades. B.J.

A82-28019 † **The effect of temperature-time factors on the metal damage and endurance characteristics of gas-turbine-engine rotor blades (Vliianie temperaturno-vremennykh faktorov na povrezhdenie metalla i kharakteristiki vynoslivosti rabochikh lopatok GTD).** V. T. Troshchenko, B. A. Griaznov, I. A. Makovetskaia, O. I. Marusii, and Iu. S. Nalimov (Akademiia Nauk Ukrainskoi SSR, Institut Problem Prochnosti, Kiev, Ukrainian SSR). *Promyshlennaia Teplotekhnika*, vol. 4, Mar.-Apr. 1982, p. 65-69. In Russian.

The endurance of turbine rotor blades was tested after prolonged operation. A significant reduction in blade endurance is revealed after 20,000 hours of operation. The main cause of observed defects was found to be the formation of a sulfur-saturated surface layer. In addition, some of the blades exhibited a reduction in cyclic strength and a displacement of the fatigue-crack-initiation zone from the base of the blade to its center. B.J.

high-quality flow visualization of complex fluid flows and insight into the phenomenological aspects of vortex generation, interactions between multiple vortices and aerodynamic surfaces and vortex burst. GRA

EXPERIMENTAL METHODS FOR THE PREDICTION OF THE EFFECT OF VISCOSITY ON PROPELLER PERFORMANCE Ph.D. Thesis
Sukeyuki Kobayashi Jun. 1981 155 p refs
(Contract N00014-76-C-0357; SR0090101)
(AD-A109846; OE-81-7) Avail: NTIS HC A08/MF A01 CSCL 13/10

A Laser Doppler Velocimeter (LDV) was used to perform a propeller wake survey for DTNSRDC propellers 4381 and 4383. Three components of the velocity were measured and from this, the velocity field and the vorticity field were constructed. Through a coordinate transformation, the vorticity field was separated into two parts i.e., trailing vorticity and boundary layer type vorticity in the viscous wake. The data was used for the prediction of propeller blade profile drag (viscous sectional drag). The idea of hypothetical flow by Betz was extended to propeller flow and a formula for the profile drag was derived in terms of velocities, which is suitable for LDV application. The radial distribution of profile drag was computed using the velocity data. It was shown that the value of Cd is close to that of 2-dimensional section at mid-radius range, but becomes substantially lower at inner and outer radii and that it goes up again near the tip and the hub. This trend is consistent with the behavior of profile drag of a finite span wing. Author (GRA)

VARIABLE RESPONSE LOAD LIMITING DEVICE Patent Application
Dwight D. McSmith, inventor (to NASA) Filed 6 Oct. 1981 18 p
(NASA-Case-LAR-12801-1; US-Patent-Appl-SN-309291) Avail: NTIS HC A02/MF A01 CSCL 13I

An energy absorbing device used as a load limiting member in a structure to control its response to applied loads is described. It functions by utilizing a spool assembly having flanged ends and an interior cavity of sufficiently large diameter to cause it to deform plastically at a prescribed load. In application, the spool is utilized as a pivot point for the legs of an aircraft seat. When properly designed and integrated into the seat arrangement the spool will twist about its axis, deforming plastically when the impact load exceeds the spool yield value. Through this deformation, the spool absorbs the kinetic energy of the movement of the seat at a substantially constant rate, thereby controlling the level of loads transmitted to the seat occupant. By proper sizing and selection of materials, it is possible to control load response in a predictable manner. NASA

TUBING AND CABLE CUTTING TOOL Patent Application
Dwight D. McSmith and James I. Richardson, inventors (to NASA) Filed 6 Oct. 1981 10 p
(NASA-Case-LAR-12786-1; US-Patent-Appl-SN-309292) Avail: NTIS HC A02/MF A01 CSCL 13I

A hand held hydraulic cutting tool was developed which is particularly useful in deactivating ejection seats in military aircraft rescue operations. The tool consists primarily of a hydraulic system composed of a fluid reservoir, a pumping piston, and an actuator piston. Mechanical cutting jaws are attached to the actuator piston rod. The hydraulic system is controlled by a pump handle. As the pump handle is operated the actuator piston rod is forced outward and thus the cutting jaws are forced together. The frame of the device is a flexible metal tubing which permits easy positioning of the tool cutting jaws in remote and normally inaccessible locations. Bifurcated cutting edges ensure removal of a section of the tubing or cable to thereby reduce the possibility of accidental reactivation of the tubing or cable being severed. NASA

HEAVY-DUTY ENGINES ANALYSIS, STUDY 4: A PRELIMINARY MARKET ANALYSIS FOR GAS-TURBINE APPLICATIONS IN THE FARM MARKET
Jul. 1981 18 p refs Prepared for Argonne National Lab.
(Contract W-31-109-eng-38)
(DE82-001756; ANL/CNSV-TM-81) Avail: NTIS HC A02/MF A01

The opportunity for the gas turbine in the farm market and if the market's requirements complement the development of the engine for other markets was analyzed. It was determined that the major applications of gas turbines in the farm equipment market are in two wheel drive and four wheel drive diesel powered tractors. However, the market for gas turbines lies at the heavier end of the spectrum. There is an opportunity for larger quantities of lower horsepower engines because turbine engines for automobiles would be in the same size range. It is suggested that the development of a reliable multifuel turbine combined with a reliable power train capable of meeting the load requirements of the farm tractor is a timely undertaking. Fuel efficiency requirements are balanced by the need for multifuel capability and imposed environmental requirements. DOE

APPLICATION OF THE FINITE ELEMENT METHOD TO ROTARY WING AEROELASTICITY Final Report
F. K. Straub and P. P. Friedmann Feb. 1982 232 p refs
(Grant NsG-1578)
(NASA-CR-165854; NAS 1.26:165854; UCLA-ENG-80-81) Avail: NTIS HC A11/MF A01 CSCL 20K

A finite element method for the spatial discretization of the dynamic equations of equilibrium governing rotary-wing aeroelastic problems is presented. Formulation of the finite element equations is based on weighted Galerkin residuals. This Galerkin finite element method reduces algebraic manipulative labor significantly, when compared to the application of the global Galerkin method in similar problems. The coupled flap-lag aeroelastic stability boundaries of hingeless helicopter rotor blades in hover are calculated. The linearized dynamic equations are reduced to the standard eigenvalue problem from which the aeroelastic stability boundaries are obtained. The convergence properties of the Galerkin finite element method are studied numerically by refining the discretization process. Results indicate that four or five elements suffice to capture the dynamics of the blade with the same accuracy as the global Galerkin method. A.R.H.

ELASTIC-PLASTIC FINITE-ELEMENT ANALYSES OF THERMALLY CYCLED DOUBLE-EDGE WEDGE SPECIMENS
Albert Kaufman and Larry E. Hunt Mar. 1982 31 p refs
(NASA-TP-1973; E-626; NAS 1.60:1973) Avail: NTIS HC A03/MF A01 CSCL 20K

Elastic-plastic stress-strain analyses were performed for double-edge wedge specimens subjected to thermal cycling in fluidized beds at 316 and 1088 C. Four cases involving different nickel-base alloys (IN 100, Mar M-200, NASA TAZ-8A, and Rene 80) were analyzed by using the MARC nonlinear, finite element computer program. Elastic solutions from MARC showed good agreement with previously reported solutions obtained by using the NASTRAN and ISO3DQ computer programs. Equivalent total strain ranges at the critical locations calculated by elastic analyses agreed within 3 percent with those calculated from elastic-plastic analyses. The elastic analyses always resulted in compressive mean stresses at the critical locations. However, elastic-plastic analyses showed tensile mean stresses for two of the four alloys and an increase in the compressive mean stress for the highest plastic strain case. M.G.

APPROACH TO THE FATIGUE ANALYSIS OF VERTICAL-AXIS WIND-TURBINE BLADES
P. S. Veers Sep. 1981 35 p refs
(Contract DE-AC04-76DP-00789)
(DE82-003193; SAND-81-2130) Avail: NTIS HC A03/MF A01

The stress history of wind turbine blades indicates that a single stress level at each wind speed does not adequately describe the blade stress history and a statistical description is required. Blade stress data from experimental turbines indicate that the Rayleigh probability density function describes the distribution of vibratory stresses at each wind speed. The Rayleigh probability density function allows the distribution of vibratory stresses to be described by the RMS of the stress vs. time signal. With the RMS stress level described for all wind speeds, the complete stress history of the turbine blades is known. Miner's linear cumulative damage rule is used as a basis for summing the fatigue damage over all operating conditions. An analytical expression is derived to predict blade fatigue life. DOE

RANGEFINDER SYSTEM FOR SLANT RANGE VISIBILITY [WEGE ZUR NETZMAESSIGEN ERFASSUNG DER SCHRAEGSICHT]

Christian Werner *In* Deutscher Wetterdienst Soc. Meteorol. Palatine, 1780-1795 1980 p 60-65 refs In GERMAN; ENGLISH summary

Avail: Issuing Activity

Careful measurement of the slant range visibility is important for safe and regular aircraft landing operations. Measurements are necessary under visibility conditions lower than 1500 m up to an altitude of about 100 m. Many remote sensing methods are known to determine the slant range visibility. A modified laser rangefinder system which uses a simplified slope method is described. The accuracy of this 'Two-Point-Method' is analyzed for several atmospheric conditions. Measurements with a described prototype system are presented. J.M.S.

WEATHER DETERIORATION MODELS APPLIED TO ALTERNATE AIRPORT CRITERIA Final Report

Edwin D. McConkey Sep. 1981 103 p
(Contract DOT-FA79NA-6029)
(AD-A108877; FAA-RD-81-92) Avail: NTIS HC A06/MF A01 CSCL 04/2

Flights under Instrument Flight Rules (IFR) require the filing of a flight plan. The flight plan must contain an alternate airport unless certain conditions at the destination are met. These conditions concern the availability of an instrument approach procedure and anticipated meteorological conditions within one hour of the estimated arrival time. Certain other conditions must be met for an airport to qualify as an alternate airport. These conditions also are based on instrument approach procedure availability and forecast meteorological conditions. Relaxation of the current requirements regarding alternate airports could benefit some aircraft operators by improving schedule reliability and reducing the number of weather related departure delays. The investigation quantified the increased risk of ceilings and visibilities being below landing minimums at several cities in the conterminous U.S. if requirements are relaxed. The study methods utilized climatology data and weather deterioration models to calculate the probability of an airport being below precision and non-precision approach minimums. Author (GRA)

A DESCRIPTIVE STUDY OF THE APPLICATION OF ANALYSIS OF VARIANCE AND REGRESSION TECHNIQUES IN AN ERROR ANALYSIS PROGRAM FOR TEST DATA OBTAINED IN A 16 FOOT TRANSONIC TUNNEL M.S. Thesis

Daisy Williams Alston Apr. 1981 216 p refs
Avail: NTIS HC A10/MF A01

A mathematical model has been designed that used standard statistical techniques to perform an error analysis of wind tunnel test data. Three separate but dependent computer programs define the procedure necessary for the generation and manipulation of the required data. By applying the methods of least squares, cubic splines, analysis of variance, and regression analysis, the programs calculate and compare experimental data with test control data. The solution of the problem reveals that the nature of the lift and drag coefficient data versus angle of attack vary linearly, therefore the equation of a straight line is sufficient to represent the data. To minimize the residual differences, a third order curve fit, which defines an equation that represents the experimental pressure coefficient data, is used. Calculation of the F-ratios determines the significant components of the 2 x 7 x 6 factorial design and indicates the independent variables that significantly reduce the error factor. M.G.

YF 102 IN-DUCT COMBUSTOR NOISE MEASUREMENTS WITH A TURBINE NOZZLE, VOLUME 1 Final Report, Sep. 1979 - Mar. 1981

Craig A. Wilson and James M. OConnell Sep. 1981 83 p refs
(Contract NAS3-21974)
(NASA-CR-165562-Vol-1; NAS 1.26:165562-Vol-1;
LYC-81-32-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 20A

The internal noise generated by an Avco Lycoming YF-102 engine combustor installed in a test rig was recorded. Two configurations were tested one with and one without the first stage turbine nozzle installed. Acoustic probes and accessories were used. Internal dynamic pressure level measurements were made at ten locations within the combustor. The combustor rig, the test procedures, and data acquisition and reduction systems are described. Tables and plots of narrow band and one third octave band pressure level spectra are included. S.L.

FLUCTUATING PRESSURES ON FAN BLADES OF A TURBOFAN ENGINE: STATIC AND WIND-TUNNEL INVESTIGATIONS

James A. Schoenster Mar. 1982 48 p refs
(NASA-TP-1976; L-14913; NAS 1.60:1976) Avail: NTIS HC A03/MF A01 CSCL 21E

To investigate the fan noise generated from turbofan engines, miniature pressure transducers were used to measure the fluctuating pressure on the fan blades of a JT15D engine. Tests were conducted with the engine operating on an outdoor test stand and in a wind tunnel. It was found that a potential flow interaction between the fan blades and six, large support struts in the bypass duct is a dominant noise source in the JT15D engine. Effects of varying fan speed and the forward speed on the blade pressure are also presented. Author

ACOUSTIC MEASUREMENTS OF F-4E AIRCRAFT OPERATING IN HUSH HOUSE, NSN 4920-02-070-2721 Final Report, May - Sep. 1981

Vincent R. Miller, G. A. Fisk, and J. M. Chinn Sep. 1981 105 p refs
(AD-A108827; AFWAL-TM-81-84-FIBE/FIBG) Avail: NTIS HC A06/MF A01 CSCL 20/1

The primary purpose of this test program was to measure the acoustic environment in the hush house facility located at Kelly Air Force Base, Texas, during operation of the F-4E aircraft to ensure that aircraft structural acoustic design limits were not exceeded. The acoustic measurements showed that sonic fatigue problems are anticipated with the F-4E aircraft aft fuselage structure during operation in the hush house. The measured acoustic levels were less than those measured in an F-4E aircraft water cooled hush house at Hill AFB in the lower frequencies, but were increased over that measured during ground run up on some areas of the aircraft. It was recommended that the acoustic loads measured in this program should be specified in

LAMINAR FLOW CONTROL SPF/DB FEASIBILITY DEMONSTRATION Final Report
R. C. Ecklund and N. R. Williams Oct. 1981 50 p
(Contract NAS1-16425)
(NASA-CR-165818; NAS 1.26:165818) Avail: NTIS HC A03/MF A01 CSCL 20D

The feasibility of applying superplastic forming/diffusion bonding (SPF/DB) technology to laminar flow control (LFC) system concepts was demonstrated. Procedures were developed to produce smooth, flat titanium panels, using thin -0.016 inch sheets, meeting LFC surface smoothness requirements. Two large panels 28 x 28 inches were fabricated as final demonstration articles. The first was flat on the top and bottom sides demonstrating the capability of the tooling and the forming and diffusion bonding procedures to produce flat, defect free surfaces. The second panel was configurated for LFC porous panel treatment by forming channels with dimpled projections on the top side. The projections were machined away leaving holes extending into the panel. A perforated titanium sheet was adhesively bonded over this surface to complete the LFC demonstration panel. The final surface was considered flat enough to meet LFC requirements for a jet transport aircraft in cruising flight. Author

POSITRON ANNIHILATION
A. Turner Sep. 1980 8 p refs
(BAE-KGT-N-GEN-00996) Avail: NTIS HC A02/MF A01

A nondestructive investigative technique, using positron annihilation, is introduced, and the physics of it are explained. The collision of a positron and an electron under thermal conditions causes the emission of annihilation radiation in the form of two gamma rays. This radiation is detected using lithium drifted germanium or intrinsic germanium detectors. Applications are limited to quality control, where the very small detection area, (0.55 sq mm to a few sq cm) is not impractical, and to monitor areas with a known defect and following the progress of cracks. Whole aircraft or large component, scanning is not possible because of the enormous number of probes required. Author (ESA)

NON-DESTRUCTIVE INSPECTION AND THE IMPLEMENTATION OF A DAMAGE TOLERANT DESIGN PHILOSOPHY
D. E. W. Stone Feb. 1981 15 p refs
(RAE-TM-Struct-982; BR78531) Avail: NTIS HC A02/MF A01

Increasing demands are being made for more quantitative NDI, but current inspection capabilities are inadequate. It is difficult to compare destructive and NDI data. Corrosion degrades inspection capability; 90% probability of detection of flaws with a 95% confidence bound is necessary, but only a 50% detection probability is attainable, for a 1/2 inch crack size, with a 95% confidence level. The implementation of a damage tolerant design philosophy requires a less subjective judgement to be made than is the case at present. Author (ESA)

ASSESSMENT OF COMMUNITY RESPONSE TO HIGH-ENERGY IMPULSIVE SOUNDS
William J. Galloway Jul. 1981 32 p refs
(AD-A110110) Avail: NTIS HC A03/MF A01 CSCL 20/1

A dose-response relationship between day-night average C-weighted sound level and average degree of community annoyance is proposed for high-energy impulsive sounds. This proposal revises the relationship originally recommended in a NRC-CHABA report (1977) to reflect more recent community response data and additional analyses of previous data. The use of sound level-weighted population as a means for assessing noise impact, as originally proposed by CHABA, is retained in this proposal. Author (GRA)

THE IMPACT AND FUTURE DIRECTION OF AIRCRAFT NOISE CERTIFICATION
M. J. T. Smith 1980 29 p refs Presented at 1980 Intern. Conf. on Noise Control Eng., Miami, Dec. 1980
(PNR-90053) Avail: NTIS HC A03/MF A01

The impact of soaring fuel costs and environmental quality pressures is discussed. After a decade of noise legislation, little real improvement has been made. The current growing emphasis on noise footprints has scared manufacturers and operators into believing that a second more powerful certification process at the airport could soon be brought into force. Existing legislation will either be replaced by newer legislation in the nineteen eighties or will become more effective. A better adaptation of existing procedures is suggested which would eliminate the need for secondary controls around airports, the operator and the airport managers judging for themselves the real impact of a new aircraft within the designated route structure. ON THE GRAVIMETRIC INVERSION PROBLEM
D. O. Riska 1981 30 p refs
(Rept-129) Avail: NTIS HC A03/MF A01

The multipole expansion series for the gravitational potential and acceleration anomalies on the flat surface of the Earth due to a subterranean body of finite extent are inverted. Explicit formulae for the multipole moments are given in terms of the potential and acceleration components on the surface. Finally a model independent method for the determination of the shape of a starlike body of fixed density from the multipole moments is presented. The results lead to a constructive approach to the inversion problem of gravimetry and also indicate an optimal set of measurement points. Author

ON GEOMORPHOLOGICAL CONVERGENCES. THE CASE OF THE NAMIB DESERT RELIEF (SKELETON COAST AND CENTRAL NAMIB DESERT - SOUTH WEST AFRICA/NAMIBIA)
Uwe Rust 1981 21 p Transl. into ENGLISH from Mitt. der Geograph. Ges. (Munich), v. 64, 1979 p 201-216 Presented at the 42nd German Geographic Meeting, Goettingen, West Germany, 5 Jun. 1979
(CSIR-Trans-1583) Avail: NTIS HC A02/MF A01

Convergence of forms and processes are studied in relation to geomorphological evidence found in the Namib desert. The concept of 'convergence' as a current principle is emphasized. The formation of sharp edged debris by gypsum wedging is compared with the formation of debris by frost wedging in a periglacial environment. In the Namib desert the gypsum wedging which results in material disintegration is linked to gypseous crust formation, and therefore rocks with different genetics can be solidly united by this crust. Important differences between the formative requirements in the Namib desert and in the periglacial environment are mentioned. Time as a factor is very important when it comes to obtaining an understanding of geomorphological convergences. S.L.

SOME APPLICATIONS OF HARTMANN-TYPE SOURCES IN AIRCRAFT NOISE RESEARCH
T. A. Holbeche and R. W. Jeffrey Nov. 1980 18 p refs
Presented at Spring Meeting of the Inst. of Acoustics, Nottingham, England, Mar. 1975
(RAE-TM-AERO-1877; BR77146) Avail: NTIS HC A02/MF A01

Inflight shielding experiments were performed with a slender delta research aircraft fitted with needle stabilized generators having 19mm diameter driving jets operated from the high pressure turbine of the aircraft engine. Acoustic power output is 1 kW and consists of a strong fundamental 2.8 kHz tone and higher harmonics, discernible above engine noise. Comparative wind tunnel experiments employed quarter-scale versions built to match the tunnel model and these operated at 11 kHz, the output level being well above tunnel backgroung noise. Calibration in an anechoic room shows output to be steady and nearly omnidirectional. Author (ESA)

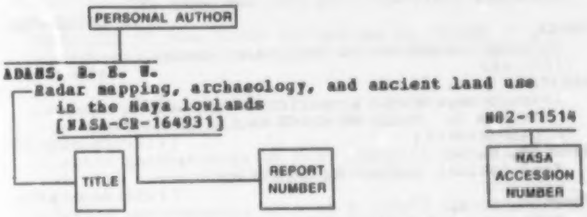
PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 150)* **JULY 1982**

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

conventional V-shaped stabilizer by a hydraulically equivalent flat-plate stabilizer makes it possible to reduce the mass of the stabilizer array without reducing the combustion efficiency. B.J.

A82-26486 † Requirements on modern mathematical models of gas turbine engines. I (Trebovaniia k sovremennym matematicheskim modeliam gazoturbinnykh dvigatelei. I). E. B. Mats and A. P. Tunakov. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 63-65. 6 refs. In Russian.

Requirements assuring the sufficient accuracy of mathematical models of gas turbine engines are discussed. Consideration is given to the possibility of taking into account the following characteristics: moisture, gas dissociation, changes in the composition and properties of the working fluid, the turbine characteristics, the Reynolds number, changes in the loss coefficient and the combustion efficiency, radial flow nonuniformity, and static-pressure difference. B.J.

A82-26487 † Method for engine-airframe integration using a high-level computer-assisted engine design system of the Apparat series (Metodika soglasovaniia dvigatelia i samoleta v SAPR-D verkhnego urovnia tsikla 'Apparat'). S. V. Rumiantsev and V. A. Sgilevskii. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 66-70. In Russian.

The theoretical principles underlying engine-airframe integration using a high-level computer-assisted engine design system are presented. The integration approach is described in detail, and a block diagram of the integration system is presented. B.J.

A82-26491 † Application of combined balancing methods to flexible rotors of aviation gas-turbine engines (Primenenie kombinirovannykh metodov uravnoveshivaniia gibkikh rotorov aviatsionnykh gazoturbinnykh dvigatelei). A. I. Gleizer. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 81-85. 5 refs. In Russian.

A82-26492 † Determination of losses in a channel with a sudden expansion behind a diffusor (K voprosu opredeleniia poter' v kanale s vnezapnym rasshireniem, raspolozhennym za diffuzorom). A. Ia. Dantsyg, N. M. Petrov, and N. N. Ponomarev. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 86-89. In Russian.

An exact and relatively simple method is proposed for determining total-pressure losses in a step diffusor, i.e., a system consisting of a diffusor and a channel with a sudden expansion. This method makes it possible to develop a procedure for analyzing losses in a step diffuser with allowance for gas compressibility in the case of variations of the degree of sudden expansion. B.J.

A82-26494 † The formation of benzpyrene during the combustion of aviation fuels (K voprosu ob obrazovanii benz/a/pirena pri gorenii aviatsionnykh topliv). V. P. Lukachev, Iu. A. Knysh, A. A. Gorbatko, and A. V. Ivliev. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 94-96. 5 refs. In Russian.

It has been suggested that the emission of benzpyrene during the combustion of jet-engine fuels should be accompanied by the emission of smoke and carbon monoxide. Experimental results are presented on the emission of benzpyrene during the combustion of kerosene in two aircraft engines. A discrepancy between the benzpyrene emission characteristics is found for the two engines, which is as yet unexplained; in one case, the benzpyrene emission characteristics are proportional to those of smoke and CO, in the other case, they are not. B.J.

A82-26495 † Methodology for determining fuel-combustion efficiency and the toxicity of exhaust gases (K metodike opredeleniia polnoty sgoraniia topliva i toksichnosti vykhlopnykh gazov). V. P. Lukachev and A. V. Ivliev. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 96-99. In Russian.

Methodological questions relating to the experimental determination of the combustion efficiency of jet-engine fuels and the toxicity of the exhaust gases are discussed. Particular consideration is given to the sampling of combustion products and to the elimination of low-frequency fluctuations of combustion-product composition. B.J.

A82-26496 † Analysis of the characteristics of a bypass engine, with allowance for variable pressure losses in the channels (Raschet kharakteristik TRDD s uchetom peremennykh poter' davleniia v kanalakh). B. D. Fishbein. *Aviatsionnaia Tekhnika,* no. 3, 1981, p. 99-102. In Russian.

A82-26500 † Radio-navigation equipment of aircraft - Devices and operation (Radionavigatsionnoe oborudovanie samoletov - Ustroistvo i ekspluatatsiia). A. N. Goliak, S. I. Plotkin, and I. F. Koval'chuk. Moscow, Izdatel'stvo Transport, 1981. 248 p. 7 refs. In Russian.

An automatic direction finder is described, taking into account general information, the goniometric system, aspects of control, the automatic tuning system, and operational details. A radio altimeter is also considered, giving attention to the high-frequency measuring device, the amplifier of the difference frequency, the transceiver unit, the altitude indicator, and details regarding the operation of the instrument. Another instrument discussed has been designed to provide air navigation on the basis of a utilization of the international VOR system and the Instrument Landing Systems. Aspects of approach control for the aircraft during landing operations are examined along with questions of instrument control, operational principles, and instrument design. A description is also provided of aircraft radio-navigation equipment employed for an automatic, continuous measurement and indication of the polar coordinates of the aircraft. G.R.

A82-26511 Automating air-traffic control. H.-M. D. Toong (MIT, Cambridge, MA) and A. Gupta. *Technology Review,* vol. 85, Apr. 1982, p. 40-49, 54. 5 refs.

The present air-traffic control system based on 1960s technology that uses redundancy to deal with random interruptions of service is being modernized for the 1990s. The system has become increasingly unreliable with obsolete hardware lacking sufficient memory space, and degrading computer response time. The FAA has proposed replacing selected pieces of existing hardware with functionally similar hardware ('rehosting'), but which would increase capacity with minimal software modification. Only basic computer instructions would be required. Communications facilities would be modernized by transmitting computer-generated instructions directly to the aircraft, reducing the involvement of air traffic controllers in this task. By 1996, the entire task of routing air traffic will be done with little human intervention, saving fuel and flying time. The cost of upgrading will be in the vicinity of $300 million, with a factor-of-ten increase over the current computer speed. C.D.

A82-26526 * # The role of modern control theory in the design of controls for aircraft turbine engines. J. Zeller, B. Lehtinen, and W. Merrill (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0320.* 32 p. 117 refs.

The development, applications, and current research in modern control theory (MCT) are reviewed, noting the importance for fuel-efficient operation of turbines with variable inlet guide vanes, compressor stators, and exhaust nozzle area. The evolution of multivariable propulsion control design is examined, noting a basis in a matrix formulation of the differential equations defining the process, leading to state space formulations. Reports and papers which appeared from 1970-1982 which dealt with problems in MCT applications to turbine engine control design are outlined, including works on linear quadratic regulator methods, frequency domain methods, identification, estimation, and model reduction, detection, isolation, and accommodation, and state space control, adaptive control, and optimization approaches. Finally, NASA programs in frequency domain design, sensor failure detection, computer-aided control design, and plant modeling are explored. M.S.K.

A82-26536 A310 - Europe builds on Airbus success. D. Velupillai. *Flight International,* vol. 121, Feb. 27, 1982, p. 477-484.

Some of the overall problems of the Airbus A310 as well as design details of its new wing are discussed. The wing has the same sweep as the A300 wing and similar slats and flaps. Greater supercriticality was achieved, with consequent reduced airfoil size and thicker section without drag penalty. A 3-D airflow analysis showed that large spanwise changes in airfoil-section were necessary, which in turn demanded extensive double curvature in the lower skin of the inner wing, produced by a new shot-peening technique. 3-D analysis was also used to optimize wing twist along the span and to minimize downward lift generated by the tail-plane during cruise. Detail improvements were made in the leading-edge slats and flaps, the outboard ailerons were eliminated, and other drag clean-ups were made. The spanwise skin-joint is now outboard and will later be eliminated. In the rest of the airframe there is minimum change. The A310 is designed for crack-free life of 20,000 flights, or about 10 years of service. Some comparisons are made with the Boeing 767 and 757 and fuel consumption, production line and cockpit details are also given. C.D.

A82-26537 **Advanced helicopter concepts compete.** G. Warwick. *Flight International,* vol. 121, Mar. 13, 1982, p. 615, 616, 625, 626.

The U.S. Army is defining a tri-Service medium-lift V/STOL aircraft for the early 1990s, with advancing-blade, tilt-rotor, and X-wing concepts among the contenders. One way to increase helicopter speed is to install a pair of coaxial counter-rotating rotors so that all lift is generated on opposing advancing blades. This enables retreating blades to operate at low or zero pitch. Helicopter speed can be increased by avoiding edgewise flow; this is done by tilting the rotors forward into the airflow to become large-diameter propellers and transferring lift to a fixed wing. Speeds of 300 kt at sea level and 350 kt at 20,000 ft are achieved. The key to X-wing is circulation control. The blades have an elliptical section with rounded leading and trailing edges. Air pumped into the hollow blades exits through narrow slots running the length of the upper surface at 5% and 95% chord. Blowing reduces drag and produces lift essentially independent of blade pitch and airflow velocity. Speeds of 500 kt have been attained. C.D.

A82-26538 **From claws to jaws - Tiger into Tigershark.** R. Braybrook. *Air International,* vol. 22, Mar. 1982, p. 111-116, 136-138.

Northrop began considering lightweight low-cost fighters in the early 1950s, building a series leading to the F-5s. These aircraft combined twin-engine safety with straightforward handling characteristics and the infrared guidance missiles gave these aircraft an effective air combat role. The F-5A was a basic fighter that gave poorer nations an introduction to supersonics at low prices, while the F-5E was a more powerful short-range air superiority fighter with ground attack capability. The F-5G Tigershark features the F404 engine with 16,390 lb of afterburning thrust, a flattened nose shape to maintain excellent handling qualities at high angle of attack, enlarged leading edge extension and improved longitudinal control. Much of the operational equipment will be that of the F-5E, but add-on or alternative equipment will soon be available. The first flight is scheduled for September 1982. C.D.

A82-26541 # **Structural design and construction of the New Technology Wing.** M. Flemming. *Dornier-Post* (English Edition), no. 4, 1981, p. 14-18.

The New Technology Wing (NTW) for general aviation aircraft uses milling for the rib flanges as well as the skin/stringer panels, providing a very smooth outside contour which improves the aerodynamic quality of the wing. The need for about 12,000 rivets is eliminated as well as the possibility of leaks that rivets entail. Only about ten percent more milling time is required by the NTW. To compress the rib flange, the usual shot peening method is inadequate. Instead, the flange is formed by two or three applications of a hand compression tool at opposite nodes of the flange all along its length. This technique causes permanent tensile stresses that could cause tension crack corrosion during extended operation. Qualifying tests are therefore envisioned in sensitive materials. No negative effects are expected with respect to fatigue, and tests confirm this. The entire wing is simply assembled and includes a lighter trailing edge box made of fiberglass reinforced plastic sandwich structures with plastic honeycombs. C.D.

A82-26542 # **Experimental program for general aviation.** W. Haberland. *Dornier-Post* (English Edition), no. 4, 1981, p. 19-22.

The New Technology Wing Program involved the design, construction, and testing of a representative wing having a novel aerodynamic profile and slotted flaps to improve maximum lift and L/D ratios, suitable wing edges to reduce induced drag, and wing design allowing cost-efficient production. More than 200 successful test flights have demonstrated 25%-40% improvement in range and 30% reduction in fuel consumption when cruising at 400 km/h, compared to conventional aircraft having the same engines and payload. The tests, which apply to both single-engine and twin-engine planes, showed that the aircraft could climb from high airfields at full payload even when one engine fails. Production cost for the wing box was reduced about 30%. C.D.

A82-26543 # **One year flight testing of the Transonic Wing.** B. Mosken. *Dornier-Post* (English Edition), no. 4, 1981, p. 38-43.

Flight testing of the Dornier Transonic Wing (TW) on the Alpha Jet A1 test bed is described. The experimental version of the TW is characterized by its transonic profile with a large leading-edge radius, a relatively flat surface curvature of the front profile, and a more pronounced camber in the rear profile. The geometrical features of the wing provide higher cruise speed, more lift or payload, and - at higher profile thickness - a correspondingly reduced structural weight and more fuel volume, depending on the design requirement. Industrial and military flight tests were made and showed that the TW provides lower fuel consumption, particularly at high Mach numbers. The TW's radius of action is improved compared to conventional wing designs. Lower corner speed is considerably reduced and upper corner speed is heightened. Stall behavior is excellent. C.D.

A82-26587 * # **Sonic fatigue testing of an advanced composite aileron.** J. Soovere (Lockheed-California Co., Burbank, CA). *(American Institute of Aeronautics and Astronautics, Dynamics Specialists Conference, Atlanta, GA, Apr. 9, 10, 1981, Paper 81-0634.) Journal of Aircraft,* vol. 19, Apr. 1982, p. 304-310. Contract No. NAS1-15069.

The sonic fatigue test program to verify the design of the composite inboard aileron for the L-1011 airplane is described. The composite aileron is fabricated from graphite/epoxy minisandwich covers which are attached to graphite/epoxy front spar and ribs, and to an aluminum rear spar with fasteners. The program covers the development of random fatigue data by means of coupon testing and model studies on a representative section of the composite aileron, culminating in the accelerated sonic fatigue proof test. The composite aileron sustained nonlinear panel vibration during the proof test without failure. Viscous damping coefficients as low as 0.4% were measured on the panels. The effects of moisture conditioning and elevated temperature on the random fatigue life of both undamaged and impact damaged coupons were investigated. The combination of impact damage, moisture, and a 180 F temperature could reduce the random fatigue life by 50%. (Author)

A82-26588 # **Fuel optimal trajectory computation.** J. W. Burrows (Boeing Computer Services Co., Energy Technology Applications Div., Seattle, WA). *Journal of Aircraft,* vol. 19, Apr. 1982, p. 324-329. 8 refs.

Roughly a quarter of the total fuel savings of the new generation of large jet transports will come from the capability of computing fuel optimal flight trajectories between departure point and destination. The shape of the trajectory in the vertical plane is treated here. A simplified mathematical model is described including spline fits to the drag and fuel flow functions. A suboptimal trajectory is found using the maximum principle of optimal control and singular perturbation theory. The inner or boundary-layer solutions are identified as the climb or descent segments of the flight, while the outer solution corresponds to cruise. The inner solutions are expanded to second order in the vicinity of the outer solution to develop cruise control laws for cost-effective response to altered in-flight conditions. (Author)

A82-26589 # **Wing/control surface flutter analysis using experimentally corrected aerodynamics.** C. D. Turner (North Carolina State University, Raleigh, NC). *Journal of Aircraft,* vol. 19, Apr. 1982, p. 342-344. 11 refs. Research supported by the Beech Aircraft Corp.

In previous studies related to the flutter problem concerning aircraft, it appeared that results based on the use of theoretical

A82-28149 The status of airport noise prediction, with special reference to the United Kingdom and Europe. J. B. Large and M. E. House (Southampton, University, Southampton, England). *Noise Control Engineering,* vol. 17, July-Aug. 1981, p. 38-44. 12 refs.

The current status of airport noise prediction is reviewed with reference to both air-to-ground noise and near-ground noise such as noise generated by road traffic, auxiliary power units, engine ground running, approaching aircraft, and aircraft on taxiways and aprons. Methodologies for contour calculation and assessment are outlined, and areas for further study and refinement of procedures are indicated. In particular, the need for greater accuracy is emphasized in assessments made for legislative and statutory purposes. V.L.

A82-28150 The impact and future direction of aircraft noise certification. M. J. T. Smith (Rolls-Royce, Ltd., Derby, England). *Noise Control Engineering,* vol. 18, Mar.-Apr. 1982, p. 52-61. 17 refs.

After an historical account of the takeoff and landing noise problems created by the introduction of jet aircraft, and the aircraft noise footprint control requirements formulated by such regulatory bodies as the International Civil Aviation Organization in response to airport community demands, attention is given to the performance parameters determining the contours of aircraft noise footprints and the procedures for their quantification. It is suggested that computed noise contour dimensions be adjusted at the lateral, flyover and approach closure points to more accurately reflect aircraft noise emission characteristics, where presently such effects as shielding, forward speed and lateral attenuation cannot be defined from first principles to the degree of accuracy often assumed. It is emphasized that regulations must recognize aircraft manufacturer's exceeding even the lowest stipulated noise limits, and suitably reward them. O.C.

A82-28275 To the root of the problem - Some helicopter research topics. R. L. Maltby (Royal Aircraft Establishment, Farnborough, Hants., England). *Aerospace (UK),* vol. 9, Mar. 1982, p. 12-18. 10 refs.

A historical review is presented of the development of aircraft which can hover in flight and land vertically, beginning with the autogyro and proceeding through the aerodynamics of helicopter flight. Initial stability problems with the autogyro were overcome by separating the lift and propulsive functions, with a concomitant loss of vertical take-off ability. Glauert's method formulated an account of the edgewise flow of the blades in forward flight and defined the vortices for induced flow theory. Wake calculations were devised to describe the spiral disturbances each blade had to pass through from the preceeding blade's passage. Computers have allowed examination of surface pressures, blade motions, and surface strains in-flight, and wake studies with 17 pressure transducers on a blade of the Puma helicopter are described. Further discussion is given of blade dynamics, flight mechanics, particularly the man-machine interface, and air and ground resonance. M.S.K.

A82-28276 * # Why twin-fuselage aircraft. J. C. Houbolt (NASA, Langley Research Center, Hampton, VA). *Astronautics and Aeronautics,* vol. 20, Apr. 1982, p. 26-35. 8 refs.

Operational and design features of twin-fuselage aircraft are outlined, noting capabilities of transporting 100-400 passengers at subsonic speeds at an efficiency of around 190 passenger mi/gal. Wings for two body aircraft are lighter and are designed more from an aerodynamics point of view due to reductions in the bending moment. A 280 passenger configuration would need a 172 ft wingspan, compared to a 155 ft wingspan for a conventional aircraft, but the conventional wings would have a larger area. The higher aspect ratio contributed to the increased efficiency of the twin body operation. A lower wetted fuselage area is calculated for the two body aircraft with passenger capacities over 190, and twin fuselages are shown to have a higher passenger packaging density than double-deck widebodies. Finally, simple compounding of existing aircraft such as the DC-9 into a two-body shape is projected to offer a 1.9 factor increase in passenger mi/gal. M.S.K.

A82-28277 # Toward VLA air-cargo service. H. Liese (Dornier GmbH, Friedrichshafen, West Germany). *Astronautics and Aeronautics,* vol. 20, Apr. 1982, p. 36-41.

Trends and design possibilities for very large aircraft (VLA) for transporting containerized cargo are examined. Time losses in current air cargo transport are attributed to repacking necessities, uncoordinated manpower, insufficient personnel and facilities, and too little notification of shipments. Air transport costs more than sea transport, and also cuts the average delivery time by over 80%. It is noted that higher value goods, especially those requiring fast delivery, are shipped by air, for a fee averaging 1.8 that of sea routes. Comparison of conventional air transport to VLA transport of containerized cargo shows that use of VLA would increase air cargo share of containerized cargo to 43% of the total cargo shipped, compared with a present-day 5.9%. Necessities for a successful VLA-based air cargo system are reviewed, including a 1000 ton takeoff weight, sea- and land-basing options, and container interface with ground transport. M.S.K.

A82-28278 # Very large vehicles - Technology looking for a need. W. H. Arata, Jr. *Astronautics and Aeronautics,* vol. 20, Apr. 1982, p. 42, 43, 77. 26 refs.

Strategic and commercial incentives for the construction of very large vehicles (VLV) to be used for transporting massive air freight are considered. The acquisition and delivery of raw materials such as Al, beryn, Ti, and Mn, for which the U.S. and Europe are completely dependent on imports, are cited as driving commercial reasons for the development of VLVs. Military employment of a rapid deployment force is noted to depend on transferring troops and supplies to remote spots of the world in short time periods, a situation which would be strongly aided by the presence of Mach 0.8 vehicles in a twin-fuselage configuration capable of carrying 1000 tons. Finally, only the combination of military and commercial demand would be sufficient to ensure the economic viability of the development of VLVs. M.S.K.

A82-28280 * # Flying qualities - A costly lapse in flight-control design. D. T. Berry (NASA, Flight Research Center, Edwards, CA). *Astronautics and Aeronautics,* vol. 20, Apr. 1982, p. 54-57, 35.

Generic problems in advanced aircraft with advanced control systems which suffer from control sensitivity, sluggish response, and pilot-induced oscillation tendencies are examined, with a view to improving techniques for eliminating the problems in the design phase. Results of two NASA and NASA/AIAA workshops reached a consensus that flying qualities criteria do not match control system development, control system designers are not relying on past experience in their field, ground-based simulation is relied on too heavily, and communications between flying qualities and control systems engineers need improvement. A summation is offered in that hardware and software have outstripped the pilot's capacity to use the capabilities which new aircraft offer. The flying qualities data base is stressed to be dynamic, and continually redefining the man/machine relationships. M.S.K.

A82-28281 # VSTOLs - We can build them, but can we sell them. J. W. Flaig (U.S. Naval Air Systems Command, Washington, DC). *Astronautics and Aeronautics,* vol. 20, Apr. 1982, p. 58-61.

Conclusions regarding the development of a VSTOL wing for the Navy reached at the 2nd AIAA/NASA VSTOL Conference are reviewed. It was noted that a specific mission could not be designated for VSTOL aircraft and, subsequently, funds could not be dedicated to the program on a full-scale development level. Decreasing the margin of greater cost of the VSTOL aircraft to 16% rather than the current 25-30% more than conventional aircraft was recommended, along with finding specific scenarios which favor VSTOL employment. A solution was indicated in that VSTOL aircraft are capable of operating out of degraded field conditions, and also that faster deck cycling is possible. Further arguments favoring the use of VSTOL aircraft such as the AV-8B were that the response time for ground support is less than half that with conventional aircraft, and that VSTOL engines are hard to extinguish. M.S.K.

A82-28311 US Navy begins slow shuffle towards V/STOL. *Flight International,* vol. 121, Feb. 20, 1982, p. 419-421.

The US Navy is defining its next fighter/attack aircraft, and it is likely to be a V/STOL type. The design requirements include a sustained speed of Mach 1.6 or better, good STOL performance, high maneuverability, and take-off weight varying from 20,000 lb for VTO to some 40,000 lb for sea-based STO strike. McDonnell-Douglas submitted a vectored-thrust design featuring a turbofan engine producing 34,000 lb with plenum chamber burning, up to Mach 2 speed, VTO weight of 29,840 lb for 103 nm combat radius. Rockwell and General Dynamics based their designs on thrust augmentors. The former uses ejector flaps; the design augmentation ratio is 1:5:1 for 20,730 lb dry installed thrust, VTO weight is 24,000 lb, STO is 29,400 lb and combat radius is 300 nm. General Dynamics' design is 37,770 lb, 21, 800 lb VTO, Mach 1.6 maximum. The Vought is 25,330 lb VTO with a tandem-fan engine combining low-bypass cruise properties with medium-bypass air flow for V/STOL. C.D.

A82-28312 **Advancing blade flight data gathered.** D. E. Fink. *Aviation Week and Space Technology*, vol. 116, Mar. 29, 1982, p. 42-44, 47.

Stability and maneuverability characteristics gathered during 200 hours of flight tests are given for the XH-59A advancing blade concept (ABC) technology demonstration aircraft, which combines twin counterrotating helicopter rotors for vertical lift with turbojets for high forward speeds. The development of the aircraft is pertinent to both the U.S. Army's 1990s requirement for advanced attack helicopters and the market for intercity commuter aircraft of sufficiently low noise emission characteristics. The control response of the XH-59A in rolling into and out of steep turns is found to be comparable to that of fixed-wing aircraft. The forward thrust available from the auxiliary engines and differential collective of the rotors eliminates the need to pitch the main rotor tilt vector forward for high-speed, level flight. O.C.

A82-28313 **Precision casting for gas turbine engines.** C. W. Foster (Rolls-Royce, Ltd., London, England). *Aircraft Engineering*, vol. 54, Feb. 1982, p. 11-14.

The paper describes the gas turbine casting process in detail. High-temperature creep resistance is the property whose desirability most advances casting and materials technology. Vacuum melting and casting, directionally solidified (DS) casting, equi-axed and single-crystal casting are major developments in the progress of this technology. The vacuum process was used in the RB211-524 engine, while the DS process was employed in more advanced engines of the RB series. Rolls-Royce has built a new demonstration furnace whose melting unit, furnace chamber, withdrawal chamber, vacuum system, casting cycle, and control system are described. The future will bring increasing use of automation, production of more cast-to-size features, single-crystal castings application and process developments that will produce complex internal cooling configurations that are impossible today. C.D.

A82-28318 **An investigation of the swirl in an S-duct.** R. W. Guo and J. Seddon. *Aeronautical Quarterly*, vol. 33, Feb. 1982, p. 25-58. 7 refs.

Measurements are presented of the static pressure, total pressure, swirl and three-dimensional turbulence in the flow through an S-curved rectangular duct mounted in a wind tunnel at different incidences, yaw angles and mass flow ratios. The results show that at high incidence there is a large vortex around an area of flow separation after the first bend and a pair of contra-rotating vortices in the flow after the second bend. The distortion of total pressure at the exit of the S-duct is significantly high, and the corresponding three-dimensional turbulence is up to 16.7%. Appreciation of the existence of this type of flow is important in the field of air intake design for jet aircraft. (Author)

A82-28322 * # **Performance degradation of propeller/rotor systems due to rime ice accretion.** K. D. Korkan (Texas A & M University, College Station, TX), L. Dadone (Boeing Vertol Co., Philadelphia, PA), and R. J. Shaw (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0286*. 14 p. Grants No. NAG3-109; No. NAG3-242.

A theoretical model has been established which is applicable to both propeller and helicopter systems that determines the effect of rime ice accretion on the thrust coefficient, power coefficient, and efficiency as a function of time in a natural icing condition. Theoretical comparisons have been made with experimentally determined decrease in propeller thrust coefficient and efficiency for five natural icing conditions with good agreement. The present analytical model is also applicable to the helicopter case, where the method predicts radial and azimuthal rotor blade ice shapes in addition to torque rise as a function of time in a natural icing condition. (Author)

A82-28349 **The characteristics and detection of low level wind shear in the critical phases of flight.** P. D. Simmons. *The Controller*, vol. 21, Mar. 1982, p. 16-18.

Wind shear, defined as a change in wind speed and/or direction per unit distance between two points in the atmosphere, can precipitate a change in aircraft airspeed or other flight characteristic which, in extreme cases, may be uncorrectable by even maximum use of pilot maneuver and power controls. While micro scale shears cause only rapid turbulence and synoptic scale shears change flight conditions more slowly than would be hazardous, meso scale shears at low levels and in either vertical or horizontal directions pose considerable danger to aircraft during their landing glide path. Horizontal wind shear, which is often more powerful than the vertical and effectively reverses wind direction, has been identified as the greater threat. The relationship of wind shear to thunderstorm activity on a global scale is considered. O.C.

A82-28395 # **Effect of contrast on space perception in TV displays of the external scene observed by the pilot (Einfluss des Kontrastes auf die Raumwahrnehmung bei TV-Flugaussensichtdarstellungen).** H. Heising. Wachtberg-Werthhoven, West Germany, Forschungsinstitut für Anthropotechnik (Forschungsinstitut für Anthropotechnik, Bericht, No. 50), 1981. 80 p. 16 refs. In German.

Procedures involving the simulation of the external visual scene perceived by the conductor of a vehicle are, in particular, employed in connection with flight simulation applications for training, research, and development programs. Heising (1977) has reported the development of a simulating device based on a raster formation approach. Every individual image obtained previously in connection with the TV recording of a flight maneuver is modified in such a way that it appears to the person in the simulator in the correct perspective with respect to his position. There are, however, variations in contrast in connection with the image processing operations. An investigation is, therefore, conducted concerning the effects of the contrast changes on space perception. It is found that aspects of positional perception are not affected by the considered contrast variations. It appears, therefore, that the contrast variations do not cause changes with respect to details of space perception. G.R.

A82-28397 **Simple vs. sophisticated TacAir avionics. II - Soviet TacAir avionics technology.** J. Bussert. *Military Electronics/Countermeasures*, vol. 8, Mar. 1982, p. 56-62.

An historical study is presented of Soviet tactical aircraft avionics developments, encompassing radars, ECM ordnance, communications and cockpit instrumentation. It is noted that (1) there has been a marked shift since 1970 from interceptor to ground support aircraft development and production, (2) that ostensibly obsolete electronics such as the MiG-25 vacuum tube-based Foxfire radar may exploit low vulnerability and exceptionally high power levels, and (3) that the simplicity of Soviet avionics design imposes a lower acquisition and maintenance cost burden while increasing reliability and the trainability of crews. It is suggested that the Soviet study of F-14 Phoenix missile systems since the Iranian revolution has been instrumental in the development of a MiG-25 two-seat variant with anti-cruise missile look down/shoot down capability. O.C.

A82-28403 **Real-time failure detection of aircraft engine output sensors.** C. W. de Silva. *Arabian Journal for Science and Engineering*, vol. 7, Jan. 1982, p. 45-53. 9 refs.

The Bayesian approach to hypothesis testing in failure detection the structural design criteria for aircraft which will be subjected to hush house operation or defining requirements for associated equipment. Recommendations were also made to increase the fatigue life of the aft fuselage. Author (GRA)

ACOUSTIC MEASUREMENTS OF F-15 AIRCRAFT OPERATING IN HUSH HOUSE, NSN 4920-02-070-2721 Final Report, May - Sep. 1981
Vincent R. Miller, G. A. Pizak, and J. M. Chinn Sep. 1981 117 p refs
(AD-A109828; AFWAL-TM-81-82-FIBE/FIBG) Avail: NTIS HC A06/MF A01 CSCL 20/1

The purpose of this test program was to measure the acoustic environment in the hush house facility located at Kelly Air Force Base, Texas, during operation of the F-15 aircraft to ensure that aircraft structural acoustic design limits were not exceeded. The acoustic measurements showed that no potential sonic fatigue problems are anticipated with the F-15 aircraft structure during operation in the hush house. However, since these acoustic levels were increased over those measuring during run up on a concrete pad, it is recommended that F-15 equipment qualification levels be checked. The data indicated that the noise field within the hush house is diffuse and that the acoustical energy in the hangar area is radiated from the region between the engine exhaust and the hush house muffler front edge toward the forward part of the hangar. Author (GRA)

N82-21043# Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.
ACOUSTIC MEASUREMENTS OF F-16 AIRCRAFT OPERATING IN HUSH HOUSE, NSN 4920-02-070-2721 Final Report, May - Sep. 1981
Vincent R. Miller, G. A. Pizak, and J. M. Chinn Sep. 1981 110 p refs
(AD-A109829; AFWAL-TM-81-83-FIBE/FIBG) Avail: NTIS HC A06/MF A01 CSCL 20/1

The purpose of this test program was to measure the acoustic environment in the hush house facility located at Kelly Air Force Base, Texas, during operation of the F-16 aircraft to ensure that aircraft structural acoustic design limits were not exceeded. The acoustic measurements showed that no sonic fatigue problems are anticipated with the F-16 aircraft aft fuselage structure during operation in the hush house. The measured acoustic levels were less than those measured in an F-16 aircraft water cooled hush house at Hill AFB, but were increased over that measured during ground run up. It was recommended that the acoustic loads measured in this program should be specified in the structural design criteria for aircraft which will be subjected to hush house operation or defining requirements for associated equipment.

THE SIXTEEN TO FORTY MICRON SPECTROSCOPY FROM THE NASA LEAR JET Final Technical Report, 1 Oct. 1970 - 31 Oct. 1980
J. R. Houck Mar. 1982 63 p refs
(Grant NGR-33-010-182)
(NASA-CR-168684; NAS 1.26:168684) Avail: NTIS HC A04/MF A01 CSCL 20F

Two cryogenically cooled infrared grating spectrometers were designed, fabricated and used on the NASA Lear Jet Observatory. The first spectrometer was used to measure continuum sources such as dust in H II regions, the galactic center and the thermal emission from Mars, Jupiter, Saturn, and Venus over the 16 to 40 micron spectral range. The second spectrometer had higher resolution and was used to measure ionic spectral lines in H II regions (S III at 18.7 microns). It was later used extensively on NASA C-141 Observatory to make observations of numerous objects including H II regions, planetary nebulae, stars with circumstellar shells, the galactic center and extragalactic objects. The spectrometers are described including the major innovations and a list of the scientific contributions. S.L.

METEOROLOGICAL IMPACT ON AVIATION FUEL EFFICIENCY
David E. Winer and John E. Wesler *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 15-19 refs

Avail: NTIS HC A07/MF A01 CSCL 01C

The connection between fuel consumption and weather data is discussed. Fuel efficient flights creating adequate near real time weather information are examined. The lack of highly resolved real time and near real time wind and temperature data at flight altitudes is investigated. The existing systems, which is based on twice a day balloon observations, supplemented by pilot reports or other occasional data, is not adequate for optimum flight planning. The impacts of upper winds and temperatures on fuel efficiency and flight planning are not widely appreciated and developing new weather products are considered. E.A.K.

OPERATIONAL PROCEDURES RELATIVE TO SEVERE WEATHER
James F. Sullivan *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 26-28

Avail: NTIS HC A07/MF A01 CSCL 01C

Severe weather impact on both safety and the economics of all types of aviation, and reduction of elimination are discussed. The functions and responsibilities of the dispatcher are outlined. All surface weather reports showing inclement weather, SIGMET REPORTS, forecasting turbulence or icing, convective SIGMETS: (1) tornadoes; (2) hail 3/4 of an inch or greater; (3) imbedded thunderstorms; (4) squall lines or (5) an area of level four or greater thunderstorms. This information along with PIREPs of severe weather are relayed to affected flights. It is concluded that operational procedures must be timely and well conceived to assure the least amount of impact on airline operations.

METEOROLOGY IMPACT ON FUTURE AIRCRAFT DESIGN

Joseph W. Stickle *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to

Aviation Systems Dec. 1981 p 29-34

Avail: NTIS HC A07/MF A01 CSCL 01C

Meteorology impact on future aircraft design is discussed. Upcoming changes in both design and operations that will be influenced by the meteorological environment are outlined. Future and more nonconventional designs and meteorological impact brought about by operational changes over the next few years are examined. E.A.K.

N82-21144*# Federal Aviation Administration, Washington, D.C. Systems Research and Development Div.
METEOROLOGY IMPACT ON ATC SYSTEM DESIGN
Frank E. VanDemark *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 35-39

Avail: NTIS HC A07/MF A01 CSCL 17G

The impact of meteorology on air traffic control (ATC) system design for designs, and for cost benefit evaluations is discussed. The myriad of choices for implementation is a problem of great magnitude, given the economic climate of today. Cost versus benefit requires greater emphasis. Expanding and improving weather data acquisition, increasing the speed of weather data transmission and automating those actions that lend themselves to standardization for automated data processing are outlined. Three programs are mentioned: (1) automated weather observations, (2) weather radar and improvements to the national airspace system as related to the handling of weather data; and (3) products. E.A.K.

N82-21145*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
OZONE AND AIRCRAFT OPERATIONS
Porter J. Perkins *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 40-44 refs

Avail: NTIS HC A07/MF A01 CSCL 04A

The cabin ozone problem is discussed. Cabin ozone in terms of health effects, the characteristics of ozone encounters by aircraft, a brief history of studies to define the problem, corrective actions taken, and possible future courses of action are examined. It is suggested that such actions include avoiding high ozone concentrations by applying ozone forecasting in flight planning procedures. E.A.K.

N82-21146*# National Aeronautics and Space Administration, Washington, D. C.
NASA RESEARCH PROGRAMS RESPONDING TO WORKSHOP RECOMMENDATIONS
A. Richard Tobiason *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 58

Avail: NTIS HC A07/MF A01 CSCL 01B

The atmospheric electricity and lightning committee forecasts lightning and dissemination of information on the probability of occurrance. A data source with the F-106 flight program was established. The objective is to improve the detectability of lightning and severe storms and help develop operational avoidance procedures and to study the use of satellite and Doppler radar to detect thunderstorms and forecast the probability of lightning. Three recommendations are made: (1) to establish a national flying lightning laboratory; (2) strike models are considered and to gather strike data; (3) to find the best way to apply electrical field data to operations. E.A.K.

N82-21147*# Naval Research Lab., Washington, D. C.
PROGRESS ON LOW ALTITUDE CLOUD ICING RESEARCH
Richard K. Jeck *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 59-63 refs Prepared in cooperation with Naval Academy

Avail: NTIS HC A07/MF A01 CSCL 04B

The icing environment at altitudes below 10,000 feet were studied. The following questions are asked, are: (1) existing aircraft certification criteria applicable; (2) too stringent on icing for helos; (3) based on accurate data; (4) appropriate for low (10,000 ft) altitudes? The research plan is outlined: review historical icing data, obtain new measurements, collect modern icing data from other groups, and recommend LWC, OAT, and MVD criteria for helicopters. Estimated accuracies and known sources of error are included. It is concluded that the net effect of possible sources of error of both signs is uncertain. E.A.K.

N82-21148*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
NASA/LEWIS RESEARCH CENTER ICING RESEARCH PROGRAM
Peggy L. Evanich *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 64-75

Avail: NTIS HC A07/MF A01 CSCL 01C

Icing requirements for commercial aircraft, light transport and general aviation aircraft, and rotorcraft were studied. The objectives was to: establish the state of the art in aircraft icing, determining the aircraft industry's icing research and technology needs, and recommending both short and long term icing programs to NASA. It is shown that all three categories of aircraft need improved and new ice protection system, icing calculational techniques, icing performance sensitivity on current and modern airfoils, and new and improved icing facilities. The need for a general aviation pilot training film concerning flight into icing conditions is also identified. E.A.K.

N82-21149*# Dayton Univ., Ohio.
EFFECT OF HEAVY RAIN ON AIRCRAFT
James K. Luers *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 76-80

Avail: NTIS HC A07/MF A01 CSCL 01C

A summary on heavy rain effects on aircraft aerodynamics validation of research and some wind shear accidents in which heavy rain were an important factor. Frost formation and what frost does to the lift and drag curves for an airfoil was examined. If frost could cause severe aerodynamic problems for both general aviation and transport aircraft due to its roughness, then heavy rain produce a similar result. The influencing parameters of heavy rain on an aircraft are studied. Sources of aerodynamic roughness due to rain and wind shear and heavy rain accidents are outlined. E.A.K.

N82-21150*# Federal Aviation Administration, Washington, D.C.
PROTOTYPE REGIONAL OBSERVATION AND FORECAST SYSTEM (PROFS)
John W. Hinkelman, Jr. *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 81-85

Avail: NTIS HC A07/MF A01 CSCL 04B

The prototype regional observation and forecast system (PROFS) outputs are demonstrated, functional design specifications to be used to procure and implement operational systems are outlined. Advanced candidate technologies are evaluated as an integral part of the process that leads to these outputs. Evaluation insures that future weather service systems will contain the optimum mix of technologies to be most cost effective in reducing the annual losses and deaths that are directly attributed to severe weather. E.A.K.

N82-21152*# National Center for Atmospheric Research, Boulder, Colo.
THE JOINT AIRPORT WEATHER STUDIES PROJECT
John McCarthy *In* NASA. Marshall Space Flight Center Proc.: 5th Ann. Workshop on Meteorol. and Environ. Inputs to Aviation Systems Dec. 1981 p 91-95
Avail: NTIS HC A07/MF A01 CSCL 04B

A block diagram of the joint airport weather studies program is presented. Background leading to the development of the program is reviewed. Basic studies, aircraft performance, and detection and warning techniques used to develop fine scale structure of thunderstorm dynamics and kinematics in the vicinity of a major airport; effect of thunderstorm low level wind shear on aircraft performance; and development of real time testing of low level wind shear detection and warning techniques and displays are described. SUBJECT INDEX

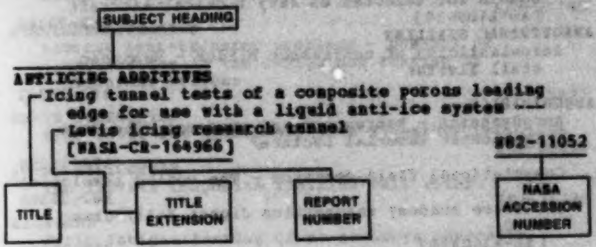
AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 150)* **JULY 1982**

Typical Subject Index Listing



SUBJECT HEADING
ANTICING ADDITIVES
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966]
N82-11052
TITLE
TITLE EXTENSION
REPORT NUMBER
NASA ACCESSION NUMBER

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

A

ABSORBERS (EQUIPMENT)
Variable response load limiting device --- for aircraft seats [NASA-CASE-LAR-12801-1] N82-20544

ACCELERATED LIFE TESTS
Evaluation of graphite/epoxy shims in a high capacity laminate helicopter bearing A82-27155
Effects of defects on tension coupons undergoing an accelerated environmental spectrum A82-27168

ACCELERATION STRESSES (PHYSIOLOGY)
Study and design of high G augmentation devices for flight simulators [AD-A109127] N82-20195

ACCESSORIES
The testing and approval of aircraft engine mounted accessories --- subject to vibration [PNR-90051] N82-21206

ACCIDENT PREVENTION
Detection and tracking algorithm refinement [AD-A109517] N82-20164

ACCURACY
Requirements on modern mathematical models of gas turbine engines. I A82-26486

ACOUSTIC DUCTS
The effect of induced sound on the flow around a rectangular body in a wind tunnel A82-26194
The Rolls Royce role in aircraft noise reduction --- jet engines, acoustic lining [PNR-90069] N82-21210

ACOUSTIC EXCITATION
Vibration of structures excited acoustically N82-20343

ACOUSTIC MEASUREMENT
Large scale model measurements of airframe noise using cross-correlation techniques A82-26966
Chicago monostatic acoustic vortex sensing system. Volume 2: Decay of B-707 and DC-8 vortices [AD-A109518] N82-20157
Acoustic measurements of F-4E aircraft operating in hush house, NSN 4920-02-070-2721 [AD-A109827] N82-21041
Acoustic measurements of F-15 aircraft operating in hush house, NSN 4920-02-070-2721 [AD-A109828] N82-21042
Acoustic measurements of F-16 aircraft operating in hush house, NSN 4920-02-070-2721 [AD-A109829] N82-21043

ACOUSTIC PROPAGATION
Sonic fatigue testing of an advanced composite aileron [AIAA PAPER 81-0634] A82-26567

ACTIVE CONTROL
The application of subsonic theoretical aerodynamics to active controls --- aircraft controls [RAE-TR-81060] N82-21217

ACTUATORS
Active flutter suppression on an F-4F aircraft [AIAA PAPER 80-0770] A82-28513
Tubing and cable cutting tool [NASA-CASE-LAR-12786-1] N82-20545
Dynamic response of a hot gas, control-surface actuator --- for an aircraft rudder [MBB-UA-599/81-OE] N82-21219

ADAPTIVE CONTROL
Applications of adaptive control systems --- to aircraft design, industrial processes and electrical drives A82-27869

ADHESIVE BONDING
Light weight adhesive joining of composite structures A82-27404
Compatibility of 350 deg curing honeycomb adhesives with phosphoric acid anodizing A82-27414
Characterization of composition variations in a structural adhesive A82-27415
Transition of aerospace adhesive bonding technology from R&D to operational use A82-27435
Correlation of surface characterization of phosphoric acid anodize oxide with physical properties of bonded specimens A82-27437
Automated ultrasonic inspection of adhesive bonded structure A82-28534
Laminar flow control SPF/DB feasibility demonstration [NASA-CR-165818] N82-21532

AERIAL RECONNAISSANCE
Analysis of side-looking airborne radar /SLAR/ performance in the detection of search and rescue targets A82-27641

AERIAL RUDDERS
Dynamic response of a hot gas, control-surface actuator --- for an aircraft rudder [MBB-UA-599/81-OE] N82-21219

AEROACOUSTICS
High frequency sound emission from moving point multipole sources embedded in arbitrary transversely sheared mean flows A82-26318
On the generation of side-edge flap noise A82-26319
Comments on 'Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery rotor noise' A82-26320

AERODYNAMIC CHARACTERISTICS
Wing/control surface flutter analysis using experimentally corrected aerodynamics A82-26869
Heavy rain penalties for a flight simulator [AIAA PAPER 82-0213] A82-27093

DYNAMIC STRUCTURAL ANALYSIS
A generalized Hill's method for the stability analysis of parametrically excited dynamic systems
A82-25923
Vibration qualification of external aircraft stores and equipment
[MBB-FE-173/S/PUB/46] N82-21218
DYNAMOMETERS
The use of dynamometer readings for damping of the natural vibrations of twin-rotor gyrocompasses
A82-28475

E

ECONOMIC ANALYSIS
VSTOLs - We can build them, but can we sell them
A82-28281
EJECTION SEATS
Development of an ejection seat ballast block for the S-3A aircraft
[AD-A109808] N82-20161
Development of a supported airbag ejection restraint (SABER) for windblast protection
[AD-A109807] N82-20162
ELASTIC DAMPING
Evaluation of the effect of elastomeric damping material on the stability of a bearingless main rotor system
A82-26394
ELASTIC PROPERTIES
Elastic-plastic finite-element analyses of thermally cycled double-edge wedge specimens
[NASA-TP-1973] N82-20566
ELASTOMERS
Evaluation of the effect of elastomeric damping material on the stability of a bearingless main rotor system
A82-26394
ELECTRIC CONTROL
Applications of adaptive control systems --- to aircraft design, industrial processes and electrical drives
A82-27869
ELECTROMAGNETIC INTERFERENCE
Main rotor hub electromagnetic signature reduction
A82-26393
ELECTROMAGNETIC PULSES
Effects of lightning and nuclear electromagnetic pulse on an advanced composites aircraft
A82-27144
ELECTROMAGNETIC RADIATION
UID terrain reflection model with application to ILS glide slope
N82-20166
ELECTROMAGNETIC SHIELDING
CH-46 and CH-47 composite rotor blade lightning protection testing
A82-26381
Effects of lightning and nuclear electromagnetic pulse on an advanced composites aircraft
A82-27144
ELECTROMECHANICAL DEVICES
SH-60B Seahawk automatic blade fold system
A82-26391
ELECTRONIC AIRCRAFT
Minutes of physical configuration audit for the F-16 Electronic Warfare Training Device
[AD-A110321] N82-21222
ELECTRONIC CONTROL
Advanced display-control concepts for power plant operation
A82-26121
ELECTRONIC COUNTERMEASURES
Acta Aeronautica et Astronautica Sinica
[AD-A110282] N82-21153
ELECTRONIC EQUIPMENT TESTS
Airline maintenance strategy
A82-27883
Airline ATE requirements
A82-27884
The role of software in commercial ATE
A82-27885
The modular ATE --- for cost effective maintenance of new generation avionics
A82-27886
AEWTS - Realistic not futuristic --- Advanced Electronic Warfare Test Set
A82-27887
ATLAS/test data provision for the Tornado ATS - A challenging task
A82-27891
Safety (aviation material)
[AD-A110361] N82-20165
ELECTRONIC MODULES
The modular ATE --- for cost effective maintenance of new generation avionics
A82-27886
ELECTRONIC WARFARE
The bomber that radar cannot see
A82-25874
AEWTS - Realistic not futuristic --- Advanced Electronic Warfare Test Set
A82-27887
Minutes of physical configuration audit for the F-16 Electronic Warfare Training Device
[AD-A110321] N82-21222
ENGINE AIRFRAME INTEGRATION
Method for engine-airframe integration using a high-level computer-assisted engine design system of the Apparat series
A82-26487
ENGINE CONTROL
The role of modern control theory in the design of controls for aircraft turbine engines
[AIAA PAPER 82-0320] A82-26526
ENGINE DESIGN
Method for engine-airframe integration using a high-level computer-assisted engine design system of the Apparat series
A82-26487
The role of modern control theory in the design of controls for aircraft turbine engines
[AIAA PAPER 82-0320] A82-26526
Engine industry cost considerations for emerging technologies
A82-27429
Advanced engine technology and its influence on aircraft performance
A82-28515
Cold-air performance of a 15.41-cm-tip-diameter axial-flow power turbine with variable-area stator designed for a 75-kW automotive gas turbine engine
[NASA-TM-82644] N82-21193
Energy efficient engine shroudless, hollow fan blade technology report
[NASA-CR-165586] N82-21196
Allowing for the wall boundary layer in a stage of an axial compressor
[PNR-90067] N82-21209
The benefits of data exchange --- between airline and engine manufacturer
[PNR-90048] N82-22095
ENGINE FAILURE
Analytical investigation of nonrecoverable stall
[NASA-TM-82792] N82-21195
ENGINE INLETS
V/STOL Tandem Fan transition section model test --- in the Lewis Research Center 10-by-10 foot wind tunnel
[NASA-CR-165587] N82-21158
ENGINE NOISE
YF 102 in-duct combustor noise measurements with a turbine nozzle, volume 1
[NASA-CR-165562-VOL-1] N82-21031
YF 102 in-duct combustor noise measurements with a turbine nozzle, volume 2
[NASA-CR-165562-VOL-2] N82-21032
YF 102 in-duct combustor noise measurements with a turbine nozzle, volume 3
[NASA-CR-165562-VOL-3] N82-21033
Fluctuating pressures on fan blades of a turbofan engine: Static and wind-tunnel investigations
[NASA-TP-1976] N82-21037
ENGINE PARTS
Strength of the turbine components of a gas-turbine engine under complex loading and associated problems
A82-27526
Precision casting for gas turbine engines
A82-28313
Elastic-plastic finite-element analyses of thermally cycled double-edge wedge specimens
[NASA-TP-1973] N82-20566
Process development and evaluation of gas turbine engine components in IMI 829 --- titanium alloy
[PNR-90050] N82-21205

ENGINE TESTS
Pacer Comet II jet engine test system A82-27903
Preliminary results on performance testing of a turbocharged rotary combustion engine [NASA-TM-82772] N82-21194
CF6 Jet Engine Diagnostics Program: High pressure compressor clearance investigation [NASA-CR-165580] N82-21197
The mechanical testing of compressors and turbines for aircraft gas turbine engines --- Rolls Royce engines [PNR-90070] N82-21211

ENVIRONMENT EFFECTS
Radome rain damage - An environmental analysis technique A82-26464

ENVIRONMENT SIMULATION
Mach 2.0 rotating arm rain erosion test apparatus A82-26461
Meteorological inputs to advanced simulators N82-21141

ENVIRONMENTAL TESTS
Sensitivity of bonded and bolted joints in composites to load/environmental spectrum variations --- in fighter aircraft structures A82-27158
Effects of defects on tension coupons undergoing an accelerated environmental spectrum A82-27168
ALQ-164 POD/AV-8C environmental evaluation flight test [AD-A110198] N82-21178

EPOXY MATRIX COMPOSITES
The YAH-64A composite flexbeam tail rotor A82-26386
ICOPTER KEVLAR A82-26389
Light weight adhesive joining of composite structures A82-27404

EPOXY RESINS
A new resin for field repair A82-27412

EQUATIONS OF MOTION
The dynamic behaviour of propeller anemometers A82-26184

ERROR ANALYSIS
A descriptive study of the application of analysis of variance and regression techniques in an error analysis program for test data obtained in a 16 foot transonic tunnel N82-20997

ESTIMATING
Statistical analysis and time series modeling of air traffic operations data from flight service stations and terminal radar approach control facilities: Two case studies [AD-A109873] N82-20172

EUROPE
The status of airport noise prediction, with special reference to the United Kingdom and Europe A82-28149

EUROPEAN AIRBUS
A310 - Europe builds on Airbus success A82-26536

EXHAUST EMISSION
The formation of benzpyrene during the combustion of aviation fuels A82-26494

EXHAUST FLOW SIMULATION
An experimental and analytical study of mixing flow of turbofan engine exhaust through circular and 2-dimensional mixer/nozzle [AIAA PAPER 82-0130] A82-27087

EXHAUST GASES
Methodology for determining fuel-combustion efficiency and the toxicity of exhaust gases A82-26495

EXHAUST NOZZLES
Static internal performance of single expansion-ramp nozzles with thrust vectoring and reversing [NASA-TP-1962] N82-20156

EXTERNAL STORES
Aerodynamic characteristics and store loads of a 1/24 scale F-111 aircraft model with three external store loadings [AD-A109449] N82-20158
ALQ-164 POD/AV-8C environmental evaluation flight test [AD-A110198] N82-21178
Vibration qualification of external aircraft stores and equipment [MBB-FE-173/S/PUB/46] N82-21218

EXTERNAL SURFACE CURRENTS
ALQ-164 POD/AV-8C environmental evaluation flight test [AD-A110198] N82-21178

EXTREMELY HIGH FREQUENCIES
Small EHF/SHF airborne SATCOM terminal A82-27209

F

F-4 AIRCRAFT
Evaluation of crack growth gages for service life tracking A82-26652
Active flutter suppression on an F-4F aircraft [AIAA PAPER 80-0770] A82-28513

F-5 AIRCRAFT
From claws to jaws - Tiger into Tigershark A82-26538

F-28 TRANSPORT AIRCRAFT
Developments to improve the noise and combustion emissions on the Fokker F28 aircraft and its Rolls-Royce RB183-555 engines. Section 1: Development of the new internal 10-Lobe mixer [PNR-90061] N82-21207

F-111 AIRCRAFT
Aerodynamic characteristics and store loads of a 1/24 scale F-111 aircraft model with three external store loadings [AD-A109449] N82-20158
Evaluation of a proposed modified F/FB-111 crew seat and restraint system [AD-A110188] N82-21167

FABRICATION
Sikorsky tail rotor - 1980: Advanced manufacturing and quality control techniques A82-26390
Energy efficient engine shroudless, hollow fan blade technology report [NASA-CR-165586] N82-21196

FAIL-SAFE SYSTEMS
Fatigue analysis of composite materials using the fail-safe concept [NASA-TM-76671] N82-20175

FAILURE ANALYSIS
Fatigue analysis of composite materials using the fail-safe concept [NASA-TM-76671] N82-20175

FAILURE MODES
Mechanically-fastened joints for advanced composites - Phenomenological considerations and simple analyses A82-27156

FAIRINGS
Development of a preloaded hybrid advanced composite wing pivot fairing A82-27131

FASTENERS
Composite fasteners - A compatible joining technique for fibrous composites in structural design --- aircraft construction materials A82-27159

FATIGUE LIFE
A simple crack closure model for prediction of fatigue crack growth rates under variable-amplitude loading A82-26630
Fracture mechanics technology applied to individual aircraft tracking --- durability and structural life estimates A82-26637
Evaluation of crack growth gages for service life tracking A82-26652
Prediction of cyclic growth of cracks and debonds in aluminum sheets reinforced with boron/epoxy A82-27151
Growth of four flaw types in graphite/epoxy composites due to fully reversed fatigue A82-27167
Fatigue analysis of composite materials using the fail-safe concept [NASA-TM-76671] N82-20175

PROCESS CONTROL (INDUSTRY)
Applications of adaptive control systems --- to aircraft design, industrial processes and electrical drives A82-27869
PRODUCT DEVELOPMENT
Energy efficient engine shroudless, hollow fan blade technology report [NASA-CR-165566] N82-21196
PRODUCTION ENGINEERING
Design and production of fiberglass helicopter rotor blades A82-27153
Transition of aerospace adhesive bonding technology from R&D to operational use A82-27435
Rational production methods for the manufacture of helicopter rotor blades --- BO-105 helicopter [MBB-UD-312/80-OE] N82-21188
PROPELLER BLADES
Aeroelastic characteristics of a mistuned bladed-disc assembly N82-20142
Experimental methods for the prediction of the effect of viscosity on propeller performance [AD-A109846] N82-20472
PROPELLER EFFICIENCY
Performance degradation of propeller/rotor systems due to rime ice accretion [AIAA PAPER 82-0286] A82-28322
PROPELLER SLIPSTREAMS
Experimental methods for the prediction of the effect of viscosity on propeller performance [AD-A109846] N82-20472
PROPELLERS
The dynamic behaviour of propeller anemometers A82-26184
A preliminary comparison between the SR-3 propeller noise in flight and in a wind tunnel [NASA-TM-82805] N82-21998
PROPULSION SYSTEM CONFIGURATIONS
Optimization of thrust algorithm calibration for Computing System (TCS) for Thrust the NASA Highly Maneuverable Aircraft Technology (HiMAT) vehicle's propulsion system [NASA-CR-163121] N82-21198
PROTECTIVE COATINGS
An evaluation of several polymers for high density humidity PC coatings A82-27432
Recent developments in materials and processes for aircraft corrosion control A82-27446
Coatings in the aero gas turbine --- sprayed coatings [PNR-90049] N82-21204
PROTOTYPES
Design and production of fiberglass helicopter rotor blades A82-27153
PYRENES
The formation of benzpyrene during the combustion of aviation fuels A82-26494
PYROCERAM (TRADEMARK)
Radome aerodynamic heating effects on boresight error A82-26465

Q

QUALITY CONTROL
Sikorsky tail rotor - 1980: Advanced manufacturing and quality control techniques A82-26390

R

RADAR ANTENNAS
Radome aerodynamic heating effects on boresight error A82-26465
Full scale test facilities for radomes and antenna windows A82-26467
Test plan for SSR --- surveillance radar for air traffic control [AD-A109503] N82-20392
RADAR CROSS SECTIONS
The bomber that radar cannot see A82-25874
RADAR DETECTION
The bomber that radar cannot see A82-25874
Analysis of side-looking airborne radar /SLAR/ performance in the detection of search and rescue targets A82-27641
Optimal target designation techniques A82-27709
RADAR SIGNATURES
Main rotor hub electromagnetic signature reduction A82-26393
RADAR TRACKING
Optimal target designation techniques A82-27709
Detection and tracking algorithm refinement [AD-A109517] N82-20164
RADIO ANTENNAS
Terrain reflection effects on data reception from airborne vehicles A82-27231
RADIO NAVIGATION
Radio-navigation equipment of aircraft - Devices and operation --- Russian book A82-26500
Corona and antenna effects on the RH-53D minesweeping helicopter and Haydist navigation set A82-27946
RADIO RECEIVERS
Automated radome performance evaluation in the Radio Frequency Simulation System /RFSS/ facility at MICOM A82-26471
Computer-program model for predicting horizontally and vertically polarized VLF atmospheric radio noise at elevated receivers [AD-A109448] N82-20384
RADIO TELEMETRY
Selection of optimum antennas for tracking telemetry intrumented airborne vehicles A82-27228
RADIO TRACKING
Selection of optimum antennas for tracking telemetry intrumented airborne vehicles A82-27228
RADOME MATERIALS
Mach 2.0 rotating arm rain erosion test apparatus A82-26461
Effects of filler materials upon radome rain erosion performance at subsonic conditions A82-26462

unsteady aerodynamics might not always represent the actually existing conditions. In an investigation of the reported difficulties, an analytical flutter model of the experimental model used by Forsching et al (1971) was developed. In order to correct the wing/control surface aerodynamics a matrix method recommended by Rodden was applied to the analytic aerodynamic data. This approach made it possible to use the experimental pressure with the analytical flutter model. Results obtained with the analysis involving the corrected aerodynamics are compared with the data provided by the uncorrected model. G.R.

A82-26620 * **Helicopter vibration suppression using simple pendulum absorbers on the rotor blade.** M.-N. H. Hamouda and G. A. Pierce (Georgia Institute of Technology, Atlanta, GA). *American Helicopter Society, National Specialists Meeting on Helicopter Vibration, Hartford, CT, Nov. 2-4, 1981, Paper.* 15 p. 10 refs. Grant No. NsG-1592.

A design procedure is presented for the installation of simple pendulums on the blades of a helicopter rotor to suppress the root reactions. The procedure consists of a frequency response analysis for a hingeless rotor blade excited by a harmonic variation of spanwise airload distributions during forward flight, as well as a concentrated load at the tip. The structural modeling of the blade provides for elastic degrees of freedom in flap and lead-lag bending plus torsion. Simple flap and lead-lag pendulums are considered individually. Using a rational order scheme, the general nonlinear equations of motion are linearized. A quasi-steady aerodynamic representation is used in the formation of the airloads. The solution of the system equations derives from their representation as a transfer matrix. The results include the effect of pendulum tuning on the minimization of the hub reactions. C.R.

A82-26630 **A simple crack closure model for prediction of fatigue crack growth rates under variable-amplitude loading.** A. U. de Koning (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands). In: Fracture mechanics; Proceedings of the Thirteenth National Symposium, Philadelphia, PA, June 16-18, 1980. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 63-85. 17 refs. Research supported by the Nederlands Instituut voor Vligtuigontwikkeling en Ruimtevaart.

A relatively simple model accounting for load interaction effects as well as for the plane strain to plane stress transition has been developed for the analysis of fatigue crack growth in aluminum alloys. The model is based on an approximate description of the crack closure behavior and can be used to predict effects of crack growth acceleration and retardation observed experimentally under variable-amplitude loading. The model has been used successfully to analyze the effect of parameter variations in a flight simulation load spectrum on the crack growth rate in centrally cracked specimens cut from 7075-T6 sheet material. V.L.

A82-26637 **Fracture mechanics technology applied to individual aircraft tracking.** A. G. Denyer (Rockwell International Corp., El Segundo, CA). In: Fracture mechanics; Proceedings of the Thirteenth National Symposium, Philadelphia, PA, June 16-18, 1980. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 288-302.

A tracking program being prepared for the USAF T-39 Utility Trainer which uses crack growth principles for both durability and damage tolerance life estimates is discussed. The tracking program consists of defining the structural life of aircraft and the corresponding crack growth limits, selecting the critical structural locations to be tracked, collecting flight records from the aircraft fleet, and performing crack growth analysis using the flight records to obtain the accumulated damage and an estimate of the remaining life. A cost-effective crack growth integration technique which makes tracking for durability feasible even if the life is as much as 100,000 hr is presented. V.L.

A82-26639 **Fracture control in ballistic-damaged graphite/epoxy wing structure.** J. G. Avery, S. J. Bradley, and K. M. King (Boeing Military Airplane Co., Seattle, WA). In: Fracture mechanics; Proceedings of the Thirteenth National Symposium, Philadelphia, PA, June 16-18, 1980. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 338-359. 6 refs. DOD-sponsored research.

A graphite/epoxy wing skin configuration has been developed which is capable of sustaining limit load after being hit by a 23-mm high-explosive-incendiary projectile under worst-case damage conditions. The skin configuration consists of a 45-deg cross-ply graphite/epoxy laminate with integral spanwise and chordwise crack-arresting pads formed by adding 0-deg glass/epoxy between the graphite/epoxy plies. The 45-deg orientation provides enhanced battle damage tolerance because of its higher residual strain-to-fracture capability relative to quasi-isotropic 0/+ or - 45/90 laminates. The fracture control approach has been successfully demonstrated for a full-scale component. V.L.

A82-26652 **Evaluation of crack growth gages for service life tracking.** C. R. Saff (McDonnell Aircraft Co., St. Louis, MO) and D. R. Holloway (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: Fracture mechanics; Proceedings of the Thirteenth National Symposium, Philadelphia, PA, June 16-18, 1980. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 623-639. 13 refs. Contract No. F42600-78-D-0014.

A82-26820 **Future helicopter technology.** R. B. Lewis, II (U.S. Army, Aviation Research and Development Command, St. Louis, MO). *Vertiflite,* vol. 28, Mar.-Apr. 1982, p. 12-15.

Technological opportunities concerning helicopter developments are related to fuel efficient engines, composite airframes, digital avionics, optical flight controls, and advanced rotor concepts. The Army is currently formulating a comprehensive program for the 1980s and 1990s which will apply these technologies to a new Light Helicopter Family, a new Special Electronic Mission Aircraft, the Advanced Attack Helicopter, and the Modernized Chinook. Particular attention is given to aspects of digital systems integration, developments regarding an employment of composite materials, advances related to engine development, and details of rotor system design. G.R.

A82-26821 **The future of helicopter flight control technology.** R. Zincone (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *Vertiflite,* vol. 28, Mar.-Apr. 1982, p. 16-19.

Major opportunities for significant technological gains by the helicopter industry in the next decade are related to the rapid advances being made in digital microprocessor technology, optical transmission, and advanced control concepts. An investigation is conducted concerning the effects of the new developments on the civil helicopters of the 1990s. The impact of new control system technology is considered, taking into account aspects of improved performance, empennage size, fly-by-wire techniques, and cost effectiveness payoffs related to maintenance. Questions concerning increased pilot productivity and safety through reduced workload are discussed, giving attention to improved handling qualities, advanced cockpit technology, cockpit systems, cockpit controls, improved ride quality, and vibration suppression. Effects of the technologies on operator requirements are also examined. G.R.

A82-26822 **NOTAR.** A. H. Logan (Hughes Helicopters, Inc., Culver City, CA). *Vertiflite,* vol. 28, Mar.-Apr. 1982, p. 20-23.

The single-rotor helicopter owes much of its longevity to the successful use of the tail rotor concept as a means of counteracting the torque induced by the main rotor rotation. However, the tail rotor does have several drawbacks, and recent Army studies have shown that the tail rotor is responsible for 15 percent of all helicopter accidents, placing it second only to engine problems. In connection with efforts to develop an antitorque concept which eliminates the tail rotor, the No-Tail-Rotor (NOTAR) design was created. The new design employs a low pressure air system in place of a tail rotor. NOTAR promises to be a viable alternative to the tail rotor in operation while affording the helicopter pilot identical maneuvering capabilities. Attention is given to details of NOTAR system design, aspects of NOTAR development, and flight tests. G.R.

A82-26966 * **Large scale model measurements of airframe noise using cross-correlation techniques.** W. R. Miller, W. C. Meecham

(California, University, Los Angeles, CA), and W. F. Ahtye (NASA, Ames Research Center, Moffett Field, CA). *Acoustical Society of America, Journal,* vol. 71, Mar. 1982, p. 591-599. 22 refs. NASA-supported research.

Cross-correlation techniques are used to measure the sound radiated by wing/flap airfoil configurations in the NASA-Ames 40 x 80 ft wind tunnel using a 6.7-m semispan model with three deployed flaps. The dominant source of flap noise is identified as the flap side edges, which exceeds that radiated by the midspan region by more than 10 dB. The turbulent surface eddies at the flap side edge have scales on the order of one-half the flap chord. The installation of flap actuator fairings at the flap side edge reduces the noise radiated from that location by 10 to 15 dB. The cross-correlation technique extracts airframe noise radiated by specific surface locations from the tunnel background noise, even when the noise is 25 dB higher than the measured airframe noise level. D.L.G.

A82-26993 # **Aeroelasticity of compressor blades - Subsonic stall flutter.** H. Loiseau and E. Szechenyi (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), Nov.-Dec. 1981, p. 47-69. 6 refs.

Studies carried out at ONERA concerning the aeroelasticity of turbomachine blades are described. Results relating to subsonic and transonic stall flutter are presented, and prediction calculations using experimental data from the wind tunnel are compared with damping and unsteady pressure measurements made in the corresponding compressor. The techniques for measuring the aeroelastic coefficients based on excitation by hydraulic actuators and measurement using transducers are found to be operational and efficient. Unsteady flow simulated in the wind tunnel is found to be well simulated from a quantitative point of view. It is concluded that the unsteady phenomena revealed by the wind tunnel tests are representative of real phenomena in compressors, and the steady flow conditions necessary for stall flutter have been established. D.L.G.

A82-27048 **Modernising air traffic control in France.** J. de Galard. *Airport Forum,* vol. 11, Feb. 1982, p. 29-34.

A description is given of the Coordonnateur Automatique du Trafic Aérien (CAUTRA) IV ATC system, which has been operating at Brest, France since 1980. CAUTRA IV uses a distributed system architecture, based on Mitra minicomputers, and incorporates as interconnected systems a centralized Initial Flight Plan Data Processing System, a Flight Plan Data Processor, and a Radar Data Processor for each enroute ATC center. There are five redundant data processing sets per center, which may be reconfigured through reconnection by means of a mixing and switching device to all synchronous interfaces supporting operational peripherals and external links. Attention is given to a computerized safety net system integrated into CAUTRA IV that is capable of automatically detecting a large percentage of threatened collisions and informing controllers. O.C.

A82-27049 **IATA's Unit Terminal Concept.** E. B. Tutty (International Air Transport Association, Technical Dept., Montreal, Canada). *Airport Forum,* vol. 11, Feb. 1982, p. 47-50.

An account is given of the airport design and development criteria formulated by the Airport Terminals Advisory Committee (ATAC) of the International Air Transport Association (IATA), which has undertaken studies of terminal units of exceptional design simplicity, smoothness of function and cost-effectiveness. These criteria are to be integrated in the forthcoming IATA Airport Terminals Reference Manual. Attention is given the Unit Terminal Concept, which has been supported by Lufthansa since the 1960s and used in the design of such airports as Cologne/Bonn, Hannover, and Berlin-Tegel with great success due to its ease of adjustment to meet novel requirements through the addition of terminal units as the need arises. O.C.

A82-27050 **The effects of weather on runway operations.** G. N. Steuart (Toronto, University, Toronto, Canada) and A. R. Gray (Urban Transport Development Co., Toronto, Canada). *Airport Forum,* vol. 11, Feb. 1982, p. 60-70. 10 refs. Research supported by the Natural Sciences and Engineering Research Council of Canada.

It is established that all phases of runway operating conditions are more variable in poor than in good weather, and that, although average runway occupancy times may remain unchanged in some deteriorating weather conditions, effective performance is reduced because operations which depend on runway friction are significantly degraded. It is further determined that all aircraft touch down on a given runway at a location that bears a fixed relationship to a specific point, and that the position of this aiming point depends on the relative approach slope and primary exit taxiway location rather than on weather conditions. While pilots often adjust deceleration to compensate for inconvenient exit locations and thereby reduce runway occupancy times in good weather, this practice is not followed in poor weather. O.C.

A82-27068 # **Correlation of wear with oxidation of carbon-carbon composites.** H. W. Chang (Bendix Advanced Technology Center, Columbia, MD). In: Wear of materials 1981; Proceedings of the International Conference, San Francisco, CA, March 30-April 1, 1981. New York, American Society of Mechanical Engineers, 1981, p. 544-547. 6 refs.

The wear characteristics of carbon-carbon composites for aircraft brake materials are investigated using an inertial dynamometer. The wear rates are measured in terms of weight loss and thickness reduction. The wear rates in terms of weight loss are in all cases greater than those in terms of thickness reduction over a wide range of braking conditions. This difference is consistent with previous work done under a normal braking condition and, as before, is attributed to the oxidation of carbon on nonfriction surfaces. Good agreement is obtained between the activation energies for oxidation of carbon (29 kcal/mole) and for material loss on nonfriction surfaces (27 kcal/mole). C.R.

A82-27071 * # **Effect of mechanical surface and heat treatments on erosion resistance.** J. Salik and D. H. Buckley (NASA, Lewis Research Center, Cleveland, OH). In: Wear of materials 1981; Proceedings of the International Conference, San Francisco, CA, March 30-April 1, 1981. New York, American Society of Mechanical Engineers, 1981, p. 592-596. 8 refs.

The effect of erosion by glass beads and crushed glass and by heat treatments on the erosional resistance of 6061 aluminum alloy and 1045 steel were studied. The aluminum alloy's erosion resistance was found to be insensitive to mechanical surface treatment applied before testing, and was determined to depend on the properties of the work-hardened surface layer; this was also demonstrated for aluminum alloy single crystals. The aluminum alloy heat treatments included annealing, solution, and precipitation. Solution was found to increase erosion resistance but precipitation had the opposite effect. Hardness showed no correlation with erosion resistance for either aluminum alloy steel. The steel tests showed that crushed glass provides an order of magnitude more erosion than glass beads. C.D.

A82-27075 * # **Rub energetics of compressor blade tip seals.** W. F. Laverty (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). In: Wear of materials 1981; Proceedings of the International Conference, San Francisco, CA, March 30-April 1, 1981. New York, American Society of Mechanical Engineers, 1981, p. 714-721. 8 refs. NASA-sponsored research.

The rub mechanics of aircraft gas turbine engine compressor abradable blade tip seals was studied at simulated engine conditions. In 12 statistically planned, instrumented rub tests using single titanium blades and fiber-metal rubstrips the rub velocity, incursion rate, incursion depth, blade thickness, and abradable strength were varied to determine the effects on rub energy, heat split between the blade, rubstrip surface and rub debris, and blade and seal wear. The rub energies were found to be most significantly affected by the incursion rate while rub velocity and blade thickness were of secondary importance. In five additional rub tests using single nickel alloy blades and multiple titanium alloy blades, rub energy and wear effects were found to be similar for titanium and nickel alloy blades while rub energies increased for multiple blades relative to single blade test results. C.D.

A82-27082 # **Communicating critical weather information to pilots.** R. C. Goff (FAA, Technical Center, Atlantic City, NJ). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0016.* 12 p.

is incorporated in a computer algorithm for real-time failure state detection in aircraft engine output sensors, along with a set of hypothesis-conditioned Kalman filters for failed sensor output estimation and associated error covariance matrix determination. Real-time processing incorporating current sensor readings is employed by the algorithm. A decision logic which overcomes analytical difficulties due to inherent aircraft engine nonlinearities is proposed, and an application of the method to a realistic turbojet engine model undergoing simulated output sensor failures furnishes a numerical example. O.C.

A82-28475 † **The use of dynamometer readings for damping of the natural vibrations of twin-rotor gyrocompasses (Pro vikoristannia pokazan' N'iutonometriv dlia dempfiruvannia vlasnikh kohivan' dvorotornikh girokompasiv).** V. M. Kalinovich (Akademiia Nauk Ukrainskoi SSR, Institut Matematiki, Kiev, Ukrainian SSR). *Akademiia Nauk Ukrains'koi SSR, Dopovidi, Seriia A - Fiziko-Matematichni ta Tekhnichni Nauki,* Jan. 1982, p. 43-46. 5 refs. In Ukrainian.

It is demonstrated that a circuit is feasible in which the damping of the natural vibrations of a twin-rotor gyrocompass is realized on the basis of dynamometer measurements. Two versions of the proposed circuit using one or two dynamometers and information on the divergence angle of the gyroscopes are discussed. V.L.

A82-28476 **Improving the crashworthiness of general aviation aircraft by crash injury investigations.** W. R. Kirkham (FAA, Civil Aeromedical Institute, Oklahoma City, OK). *Aviation, Space, and Environmental Medicine,* vol. 53, Apr. 1982, p. 319-325.

An aircraft accident investigation program correlates injuries to occupants with the severity of impacts and structural changes in the crash. Findings brought to the attention of aircraft manufacturers have led to specific aircraft being made more crashworthy. The finding of a failure in a shoulder harness attachment led to the strengthening of the attachment brace. The way a shoulder harness was joined to a lapbelt was modified following a noted failure. The finding of fractures of lapbelt and shoulder harness cable tiedowns led to the use of stronger cables and modification of the installation. Other findings resulted in a shoulder strap guide being placed on an inertia reel and a sidemounted seat being modified. Described also are three seat-related features which, although meeting FAA standards, during the dynamics of a crash may lack desirable energy attenuation. These findings illustrate the value of aircraft crash injury correlations. (Author)

A82-28513 # **Active flutter suppression on an F-4F aircraft.** O. Sensburg, H. Hönlinger (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany), T. E. Noll, and L. J. Huttsell (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *(AIAA, ASME, ASCE, and AHS, Structures, Structural Dynamics and Materials Conference, 21st, Seattle, WA, May 12-14, 1980, AIAA Paper 80-0770.) Journal of Aircraft,* vol. 19, May 1982, p. 354-359. 18 refs.

Extensive research programs have been conducted at Messerschmitt-Bölkow-Blohm (MBB) to investigate the application of active flutter and mode control to achieve increased flutter margins. Such techniques are of special interest for airplanes that already have a full command and stability augmentation system together with fast responding control surface actuators and that carry heavy wing mounted stores. A flutter suppression system (FSS) was installed on the F-4F, and this system was flight tested. The control law was found by applying optimal control theory, thus minimizing the control surface motion due to disturbances and providing the required stability margins. During the test it was found that the dynamic properties of the wing-pylon-store system change considerably with vibration amplitude because of play and preload. (Author)

A82-28514 # **Experimental study of oscillating-wing propulsion.** J. D. DeLaurier (Toronto, University, Toronto, Canada) and J. M. Harris (Battelle Memorial Institute, Columbus, OH). *Journal of Aircraft,* vol. 19, May 1982, p. 368-373. 10 refs. Research supported by the University of Toronto.

In this experimental study of flapping-wing thrust, a wing of 8 in. span and 2 in. chord was oscillated in a low-speed wind tunnel. The driving apparatus produced nearly sinusoidal heaving with superimposed pitching of variable amplitude and phase angle. The flapping frequency range of 0-8 Hz produced reduced frequencies for which flow separation was unlikely to occur, based on the measured static characteristics of the test airfoil (NACA 0012) over the Reynolds number range of interest (25,000-40,000). The average thrusting effort of the wing was measured and plotted in coefficient form against reduced frequency, with pitching amplitude and phase angle as parameters. Comparisons of the results with theoretical predictions and previous experimental work were made. In general, the results show approximately linear dependence of thrust on reduced frequency and best performance at phase angles of 90-120 deg of pitching lagging heaving. Although thrusting effort was produced for all pitching amplitudes, including zero, the highest readings were obtained for the maximum pitching amplitude of 12.1 deg. (Author)

A82-28515 # **Advanced engine technology and its influence on aircraft performance.** U. Olsson (Volvo Flugmotor AB, Trollhattan, Sweden). *Journal of Aircraft,* vol. 19, May 1982, p. 380-384. Research supported by the Swedish Air Material Board.

In order to identify problem areas and to investigate the importance of advanced engine technologies, design studies were made on a hypothetical engine for the mid-1980s. The resulting engine has a turbine inlet temperature of 1800 K, overall pressure ratio of 22.9, and thrust-to-weight ratio of 11.5. Technologies involved include boron-aluminum fan blades, a two-stage flash-vaporizing combustor, tungsten-reinforced turbine blades, and full authority electronic control. In fighter mission simulation studies the engine has been shown to result in aircraft superior to those existing today. (Author)

A82-28518 # **Effect of downwash on the induced drag of canard-wing combinations.** G. F. Butler (Royal Aircraft Establishment, Farnborough, Hants., England). *Journal of Aircraft,* vol. 19, May 1982, p. 410, 411. 7 refs.

The induced drag of canard-wing and wing-tail combinations is calculated for the limiting case in which the downstream surface is located in the Trefftz plane (infinite stagger), but based on the assumption that the loading on each surface is elliptical in isolation. It is shown that additional terms associated with induced circulation effects act to reduce the drag over that calculated using the classical theory. This induced thrust component is shown to be very small for the wing-tail configuration, but significant for the canard-wing layout. In addition, given elliptic loading on the upstream surface, an expression is derived for the loading distribution on the downstream surface which is optimum in the sense that the induced thrust component is maximized. G.R.

A82-28519 # **Aircraft pitch attitude as a performance parameter.** M. E. Eshelby (Cranfield Institute of Technology, Cranfield, Beds., England). *Journal of Aircraft,* vol. 19, May 1982, p. 412-414.

It is pointed out that in transport operations the pitch attitude of the cabin may have an effect on the safety and the comfort of the passengers and the crew. If the angle of the cabin floor to the horizontal is steep, it will present a hazard to passengers and cabin staff moving about the aircraft. It is preferable to maintain as much as possible a near-level cabin pitch attitude throughout the flight. Once the enroute climb is initiated it should be possible to restrict the aircraft body axis system to very small limits. This can be achieved by using the changes in zero-lift incidence with flap setting, and associated changes in zero lift drag, to determine the relationship between aircraft body attitude and wing incidence and equating the difference to flight path gradient. An analysis of attitude-directed performance is conducted. G.R.

A82-28534 **Automated ultrasonic inspection of adhesive bonded structure.** D. J. Hagemaier (Douglas Aircraft Co., Long Beach, CA). *Materials Evaluation,* vol. 40, Apr. 1982, p. 572-578. 14 refs.

The development of an automated ultrasonic bond inspection device for inspecting adhesively bonded metal-to-metal panels containing voids and porosity is described. Defects are noted to be present in the interface between the adhesive and the sheet metal, in the cured adhesive material, and other types caused during fabrication. A multiprobe adhesive bond inspection technique employing an ultrasonic resonance impedance method was chosen for operation in the immersion mode. The samples were C-scanned at 5 MHz, then again with a modified tester at 300 kHz at varying water paths from 0.025-2.54 mm. Finally, a 166 kHz scan was proven capable of detecting porosity, voids, and unbonds. The results indicate acceptable performance for applications in automated high production rate bonded fuselage inspections. M.S.K.

INDUSTRIAL EXPERIENCE IN THE ANGLO-FRENCH HELICOPTER COLLABORATION
J. C. Sieffer 1980 8 p
(SNIAS-811-210-101) Avail: NTIS HC A02/MF A01

Anglo-French helicopter collaboration are summarized. The development of the SA 330 Puma, the SA 341 Gazelle, and the WG 13 Lynx multipurpose helicopter, with three versions for a variety of uses, is covered, and the launching of derivative aircraft (Westland WG 30 and Aerospatiale Super-Puma) is mentioned. The organization and experience of the collaboration are described, with the French and British shares of the work on each helicopter quantified. Sales are reviewed and compared with forecasts. A SUMMARY OF EXPERIMENTAL DATA ON WING CHARACTERISTICS AT TRANSONIC SPEEDS
T. Nonweiler Apr. 1948 42 p refs
(RAE-TN-Aero-1953-S.D.-77) Avail: NTIS HC A03

Dropped and rocket propelled models are tested. American tests give a variation in form drag with thickness at the speed of sound in accordance with the two thirds power law. British tests indicate a constant dray coefficient on frontal area. There is a tendency to reduce drag by introducing taper or reducing aspect ratio on rectangular wings. Results on swept wings are inconsistent but the reduction in drag with sweepback is very pronounced. Tunnel bulge tests indicate that the drag due to lift becomes very large at Mach numbers just below 1. Author (ESA)

HELICOPTER ROTOR LOADS USING A MATCHED ASYMPTOTIC EXPANSION TECHNIQUE Final Report
G. Alvin Pierce and Anand R. Vaidyanathan May 1981 125 p refs
(Contract NAS1-16222)
(NASA-CR-165742; NAS 1.26:165742) Avail: NTIS HC A06/MF A01 CSCL 01A

The theoretical basis and computational feasibility of the Van Holten method, and its performance and range of validity by comparison with experiment and other approximate methods was examined. It is found that within the restrictions of incompressible, potential flow and the assumption of small disturbances, the method does lead to a valid description of the flow. However, the method begins to break down under conditions favoring nonlinear effects such as wake distortion and blade/rotor interaction. E.A.K.

AEROELASTIC ANALYSIS OF THE ELASTIC GIMBAL ROTOR Report, May 1980 - May 1981
Raymond G. Carlson and Wen-Liu Miao May 1981 102 p refs Prepared for Army Research and Technology Labs.
(Contract DAAK51-80-C-0016)
(NASA-CR-166287; NAS 1.26:166287; USAAVRADCOM-TR-82-A-3; SER-510046) Avail: NTIS HC A06/MF A01 CSCL 01A

An aeroelastic and structural loads analysis of the elastic gimbal rotor (EGR) was conducted. The structural loads analysis of the elastic gimbal rotor indicated that the gimbal spring element is the critical component in the rotor system design, but that practical designs for all components should be achievable. The aeroelastic analysis was conducted using a version of the G400 Rotor Aeroelastic Analysis especially modified to evaluate the EGR. Hover stability showed that a stiff inplane blade was more stable than a soft inplane blade. Stability was sensitive to control system coupling (pitch gimbal coupling), gimbal spring stiffness, and blade frequency placement. Ground resonance analysis showed both soft and stiff inplane rotors to be stable. A limited evaluation of the EGR in forward flight was conducted. Due to G400 analysis limitations, the results were not sufficient to define forward flight stability and stress limits. B.W.

V/STOL TANDEM FAN TRANSITION SECTION MODEL TEST
William E. Simpkin Mar. 1982 156 p refs
(Contract NAS3-22155)
(NASA-CR-165587; NAS 1.26:165587; TR2-53200/2R-53085) Avail: NTIS HC A08/MF A01 CSCL 01A

An approximately 0.25 scale model of the transition section of a tandem fan variable cycle engine nacelle was tested in the NASA Lewis Research Center 10-by-10 foot wind tunnel. Two 12-inch, tip-turbine driven fans were used to simulate a tandem fan engine. Three testing modes simulated a V/STOL tandem fan airplane. Parallel mode has two separate propulsion streams for maximum low speed performance. A front inlet, fan, and downward vectorable nozzle forms one stream. An auxilliary top inlet provides air to the aft fan - supplying the core engine and aft vectorable nozzle. Front nozzle and top inlet closure, and removal of a blocker door separating the two streams configures the tandem fan for series mode operations as a typical aircraft propulsion system. Transition mode operation is formed by intermediate settings of the front nozzle, blocker door, and top inlet. Emphasis was on the total pressure recovery and flow distortion at the aft fan face. A range of fan flow rates were tested at tunnel airspeeds from 0 to 240 knots, and angles-of-attack from -10 to 40 deg for all three modes. In addition to the model variables for the three modes, model variants of the top inlet were tested in the parallel mode only. These lip variables were: aft lip boundary layer bleed holes, and Three position turning vane. Also a bellmouth extension of the top inlet side lips was tested in parallel mode. B.W.

COMPUTATION OF WING-VORTEX INTERACTION IN TRANSONIC FLOW USING IMPLICIT FINITE DIFFERENCE ALGORITHM Final Report
G. Srinivasan and J. L. Steger Mar. 1981 63 p refs
(Contract NAS2-10474)
(NASA-CR-166251; NAS 1.26:166251) Avail: NTIS HC A04/MF A01 CSCL 01A

An implicit delta form finite difference algorithm for Euler equations in conservation law form was used in preliminary calculations of three dimensional wing vortex interaction. Both steady and unsteady transonic flow wing vortex interactions are computed. The computations themselves are meant to guide upcoming wind tunnel experiments of the same flow field. Various modifications to the numerical method that are intended to improve computational efficiency are also described and tested in both two and three dimensions. Combination of these methods can reduce the overall computational time by a factor of 4. S.L.

LOW-SPEED MEASUREMENTS OF THE STATIC PRESSURE DISTRIBUTION AND OVERALL FORCES ON A CAMBERED AND A SYMMETRIC MILD GOTHIC WING OF ASPECT RATIO 1.4
P. J. Butterworth and D. G. Dobney London HMSO 22 May 1980 85 p refs
(RAE-TR-80066; RAE-AERO-3482; BR75504) Avail: NTIS HC A05/MF A01

A cambered wing of aspect ratio 1.4 was tested in a low speed wind tunnel to determine its surface static pressure distribution at its designed attached flow incidence for comparison with the theoretical loading. To isolate the effects of camber on the separated flow characteristics of this planform, the corresponding symmetric wing was also included in the test program. The lift, drag and pitching moment characteristics of each wing were measured over a range of Reynolds numbers for comparison with the results of the earlier force tests and those derived by integration of the measured pressure distributions. It is found that at twice the design lift coefficient, the lift-dependent drag of the cambered wing is about 20% lower than that of the symmetric wing due to the favorable shift of the minimum point of the drag caused by the addition of camber. At higher values of the lift coefficient this reduction in lift-dependent drag is less, due to the unfavorably changed shape of the cambered wing's drag polar. Also, flow visualization tests and the form of the measured pressure distribution near the leading edges of the cambered wing at its design incidence confirm that the flow is attached along the leading edges. AERODYNAMICS PROJECT. SIGNIFICANCE AND DIFFICULTIES IN THE EXPERIMENTAL AND NUMERICAL SIMULATION OF COMPLEX FLOW PROCESSES WITH HIGH REYNOLDS NUMBER AS PART OF AIRCRAFT PROJECTS [PROJEKTAERODYNAMIK. BEDEUTUNG UND PROBLEMATIK VON EXPERIMENTELLEN UND NUMERISCHEN SIMULATIONEN KOMPLEXER STROEMUNGSVORGAENGE MIT GROSSER REYNOLDS-ZAHL FUER DIE PROJEKTENTWICKLUNG VON FLUGZEUGEN]

W. Heinzerling 29 May 1980 29 p refs In GERMAN
(MBB-FE-120/S/PUB/33; DGLR-80-028) Avail: NTIS HC A03/MF A01

The importance of aerodynamic simulation in design processes is considered. Simulation as an aid in aircraft development is discussed, revealing fundamental problems posed by the modeling of flow regimes on aircraft configurations. The geometry and complexity of flow mechanics for specific configurations are elaborated. The observance of Reynolds similarity conditions is discussed. Possibilities and limitations of complex aerodynamic simulation are assessed. Numerical, experimental, and high Reynolds number simulation are then evaluated. Results are used in reviewing plans for a European transonic cryogenic wind tunnel. Given an optimal layout, the impact of this facility on the performance and competitiveness of the European aircraft industry is forecast. Author (ESA)

PRESSURE MEASUREMENTS ON A WING OSCILLATING IN SUPERCRITICAL FLOW

N. C. Lambourne and B. L. Welsh London HMSO 25 Jun. 1979 178 p refs
(RAE-TR-79074; RAE-Struct-BF/B/0783; BR71046) Avail: NTIS HC A09/MF A01

Perturbation pressures were measured on a model wing oscillating in a wind tunnel to study wing flutter under transonic conditions. The half model, which is based on a high aspect ratio wing of modern design could be given a small-amplitude oscillation consisting of rigid body rotation about a swept axis. The unsteady in-phase and in-quadrature pressure distributions were measured at five chordwise stations. Free stream Mach number was varied in stages from 0.80 to 0.86. The measurements were restricted to one value of oscillation frequency which corresponded to frequency parameters, based on mean chord, in the range 0.39 to 0.54. The oscillatory pressure distributions together with the principal oscillatory wing forces and moments obtained by integration are considered in relation to the steady flow pattern over the wing and particularly in relation to the development of transonic mixed flow at the upper surface. The effects arising from the presence of a shock wave are identified and discussed. Some comparisons are made between the measurements and the results of subsonic thin wing theory. Author (ESA)

PRESSURE DISTRIBUTIONS ON SOME DELTA WINGS AT M = 4

L. C. Squire (Cambridge Univ., Engl.) and K. C. Moore London HMSO 22 May 1980 46 p refs
(RAE-TR-80068; RAE-Aero-3484; BR76040) Avail: NTIS HC A03/MF A01

Complete pressure distributions are presented for a series of delta wings tested through an incidence range at a Mach number of 4. Aspect ratios of models 1 and 3 were 4/3 and 1 respectively, and models 3 to 7, 2/3. The results were integrated to obtain lift and drag coefficients and the values found are in good agreement with the trend from measurements on similar wings at lower Mach numbers. Some of the models were designed to test a possible method of engine/airframe integration. The results show that it is possible to add volume to the rear of the wing without increasing the drag of the forebody, thus confirming the proposed method of integration. Author (ESA)

FULL-SCALE FLAMMABILITY TEST DATA FOR VALIDATION OF AIRCRAFT FIRE MATHEMATICAL MODELS

Jerome F. Kuminecz and Richard W. Bricker Feb. 1982 874 p refs
(NASA-TM-58244; NAS 1.15:58244) Avail: NTIS HC A99/MF A01 CSCL 01C

Twenty-five large scale aircraft flammability tests were conducted in a Boeing 737 fuselage at the NASA Johnson Space Center (JSC). The objective of this test program was to provide a data base on the propagation of large scale aircraft fires to support the validation of aircraft fire mathematical models. Variables in the test program included cabin volume, amount of fuel, fuel pan area, fire location, airflow rate, and cabin materials. A number of tests were conducted with jet A-1 fuel only, while others were conducted with various Boeing 747 type cabin materials. These included urethane foam seats, passenger service units, stowage bins, and wall and ceiling panels. Two tests were also included using special urethane foam and polyimide foam seats. Tests were conducted with each cabin material individually, with various combinations of these materials, and finally, with all materials in the cabin. The data include information obtained from approximately 160 locations inside the fuselage. Author

EVALUATION OF A PROPOSED MODIFIED F/FB-111 CREW SEAT AND RESTRAINT SYSTEM

James W. Brinkley, James H. Raddin, Jr., Bernard F. Hearon, Lawrence A. McGowan, and Joseph M. Powers Nov. 1981 418 p refs
(AF Proj. 7231)
(AD-A110188; AFAMRL-TR-80-52) Avail: NTIS HC A18/MF A01 CSCL 01/3

A total of 187 human impact tests were performed in the cardinal axes, including vertical (up to 10G, 8.1 m/sec), sideward (up to 8G, 9.2 m/sec), and forward facing (up to 10G, 9.8 m/sec). Subjects were exposed to similar impacts using different seat position adjustments to allow parametric analysis. Measured data included seat acceleration and velocity, head and chest translational acceleration components, triaxial forces acting on the seat pan and footrest, forces acting at the restraint harness attachments, and displacements of various body segments. In vertical impact tests, the forward position of the headrest appeared to cause increased forward acceleration of the head. Vertical impact tests demonstrated increased head accelerations with higher shoulder harness angles. Analysis of restraint loads in sideward impacts showed that more of the lateral support is provided by the lap belt with higher shoulder harness angles. This indicates potentially degraded lateral support of the upper torso with the proposed modification. GRA

Aerodynamic characteristics and store loads of a 1/24 scale F-111 aircraft model with three external store loadings [AD-A109449] N82-20158
Effect of heavy rain on aircraft N82-21149
Minutes of physical configuration audit for the F-16 Electronic Warfare Training Device [AD-A110321] N82-21222

AERODYNAMIC DRAG
Sensitivity of helicopter aeromechanical stability to dynamic inflow A82-25773
Effect of downwash on the induced drag of canard-wing combinations A82-28518
Numerical aircraft design using 3-D transonic analysis with optimization, volume 2. Part 2: Fighter design [AD-A110036] N82-21182

AERODYNAMIC FORCES
Results of recent measurements on an oscillating aerofoil A82-26223
Unsteady response of rectangular wings in spanwise uniform shear flow A82-26340

AERODYNAMIC HEATING
Radome aerodynamic heating effects on boresight error A82-26465
Duplication of radome aerodynamic heating using the Central Receiver Test Facility solar furnace A82-26468

AERODYNAMIC INTERFERENCE
Theoretical and experimental investigations of wind tunnel interference due to angle of attack [MBB-FE-124/S/PUB/34] N82-21226

AERODYNAMIC LOADS
The Model 412 multi-bladed rotor system A82-26376
Helicopter vibration suppression using simple pendulum absorbers on the rotor blade A82-26620
A simple crack closure model for prediction of fatigue crack growth rates under variable-amplitude loading A82-26630
Aerodynamic characteristics and store loads of a 1/24 scale F-111 aircraft model with three external store loadings [AD-A109449] N82-20158
A surface singularity method for rotors in hover or climb [AD-A109687] N82-20178
Numerical aircraft design using 3-D transonic analysis with optimization, volume 2. Part 2: Fighter design [AD-A110036] N82-21182

AERODYNAMIC NOISE
Comments on 'Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery rotor noise' A82-26320

AERODYNAMIC STABILITY
Sensitivity of helicopter aeromechanical stability to dynamic inflow A82-25773
A generalized Hill's method for the stability analysis of parametrically excited dynamic systems A82-25923
Development of an ejection seat ballast block for the S-3A aircraft [AD-A109808] N82-20161
Development of longitudinal equivalent system models for selected US Navy tactical aircraft [AD-A109488] N82-20189

AERODYNAMIC STALLING
Aeroelasticity of compressor blades - Subsonic stall flutter A82-26993

AERODYNAMICS
Aerodynamics - Retrospect and prospect /The 21st Lanchester Memorial Lecture/ A82-26098
Computational fluid dynamics - The coming revolution A82-26366
Air Force Academy aeronautics digest Fall/Summer 1980 [AD-A108338] N82-20139
Design criteria for flightpath and airspeed control for the approach and landing of STOL aircraft [NASA-TP-1911] N82-20187
Cold-air performance of a 15.41-cm-tip-diameter axial-flow power turbine with variable-area stator designed for a 75-kW automotive gas turbine engine [NASA-TM-82644] N82-21193

AEROELASTICITY
A generalized Hill's method for the stability analysis of parametrically excited dynamic systems A82-25923
Results of recent measurements on an oscillating aerofoil A82-26223
Performance and aeroelastic tradeoffs on recent rotor blade designs A82-26396
Aeroelasticity of compressor blades - Subsonic stall flutter A82-26993
Aeroelastic characteristics of a mistuned bladed-disc assembly N82-20142
Application of the finite element method to rotary wing aeroelasticity [NASA-CR-165854] N82-20561
Aeroelastic analysis of the elastic gimbal rotor [NASA-CR-166287] N82-21157

AERONAUTICAL ENGINEERING
Von Karman and VKI - The first 25 years A82-25673
Air Force Academy aeronautics digest Fall/Summer 1980 [AD-A108338] N82-20139
Journal of Aeronautics and astronomy [AD-A109681] N82-20140
Future of general and commuter aviation technology and trade [GPO-85-832] N82-20159
Acta Aeronautica et Astronautica Sinica [AD-A110282] N82-21153
The benefits of data exchange --- between airline and engine manufacturer [PNR-90048] N82-22095

AERONAUTICS
Studies in the history and theory of development of aviation and rocketry and space science and technology --- Russian book A82-27398
Proceedings: Fifth Annual Workshop on Meteorological and Environmental Inputs to Aviation Systems [NASA-CP-2192] N82-21139
Meteorological impact on aviation fuel efficiency N82-21140
Operational procedures relative to severe weather N82-21142
Meteorology impact on future aircraft design N82-21143

AEROSPACE ENGINEERING
Fibrous composites in structural design --- Book A82-27126
AEROSPACE INDUSTRY
Advanced display-control concepts for power plant operation A82-26121
Transition of aerospace adhesive bonding technology from R&D to operational use A82-27435
AEROSPACE MEDICINE
Ozone and aircraft operations N82-21145
AEROTHERMODYNAMICS
Inverse heat-transfer problems - Domains of application in the design and testing of technical systems A82-25971
AH-1G HELICOPTER
Main rotor hub electromagnetic signature reduction A82-26393
AH-64 HELICOPTER
The YAH-64A composite flexbeam tail rotor A82-26386
AILERONS
Sonic fatigue testing of an advanced composite aileron [AIAA PAPER 81-0634] A82-26567
AIR BAG RESTRAINT DEVICES
Development of a supported airbag ejection restraint (SABER) for windblast protection [AD-A109807] N82-20162
AIR CARGO
Toward VLA air-cargo service A82-28277
AIR COOLING
Acoustic measurements of F-16 aircraft operating in hush house, NSN 4920-02-070-2721 [AD-A109829] N82-21083
AIR FLOW
Sonic wind tunnel of the Institute of Fluid Mechanics of Lille [NASA-TM-76687] N82-20192
ALQ-164 POD/AV-8C environmental evaluation flight test [AD-A110198] N82-21178
AIR NAVIGATION
Integration of multi-sensor navigation data using optimal estimation techniques A82-25577
Radio-navigation equipment of aircraft - Devices and operation --- Russian book A82-26500
RAMP - A fault tolerant distributed microcomputer structure for aircraft navigation and control A82-27714
Corona and antenna effects on the RH-53D minesweeping helicopter and Raydist navigation set A82-27946
AIR TRAFFIC
Statistical analysis and time series modeling of air traffic operations data from flight service stations and terminal radar approach control facilities: Two case studies [AD-A109873] N82-20172
AIR TRAFFIC CONTROL
On-board computers save fuel and help ATC A82-26046
Automating air-traffic control A82-26511
Modernizing air traffic control in France A82-27048
Air traffic control en route computer modernization [GPO-82-773] N82-20167
FAA air traffic control computer modernization [GPO-82-375] N82-20168
Aircraft collision avoidance and air traffic safety [GPO-88-545] N82-20169
Operational delay day forecasts for the 20 air route traffic control centers for the year 1982 through 2011 [AD-A109844] N82-20173
Test plan for SSR --- surveillance radar for air traffic control [AD-A109503] N82-20392
Proceedings: Fifth Annual Workshop on Meteorological and Environmental Inputs to Aviation Systems [NASA-CP-2192] N82-21139
Operational procedures relative to severe weather N82-21142
Meteorology impact on ATC system design N82-21144
Preliminary functional description of integrated flow management --- for air traffic control systems [AD-A109909] N82-21171
Joint US/USSR mode S compatibility test program, volume 1 [PB82-126616] N82-21173
Joint US/USSR mode S compatibility test program, volume 2 [PB82-126624] N82-21174
Overview of the O'Hare Runway configuration management system [AD-A110137] N82-21224
AIR TRANSPORTATION
Toward VLA air-cargo service A82-28277
AIRBORNE EQUIPMENT
Small EHF/SHF airborne SATCOM terminal A82-27209
Selection of optimum antennas for tracking telemetry intrumented airborne vehicles A82-27223
AIRBORNE SURVEILLANCE RADAR
Analysis of side-looking airborne radar /SLAR/ performance in the detection of search and rescue targets A82-27681
AIRBORNE/SPACEBORNE COMPUTERS
On-board computers save fuel and help ATC A82-26046
AIRCRAFT
The effect of fuel composition on groundfall from aircraft fuel jettisoning [AD-A110305] N82-21424
AIRCRAFT ACCIDENT INVESTIGATION
Improving the crashworthiness of general aviation aircraft by crash injury investigations A82-28476
AIRCRAFT ACCIDENTS
A survey of U.S. Army helicopter main and tail rotor blade obstacle strikes A82-26385
AIRCRAFT ANTENNAS
Terrain reflection effects on data reception from airborne vehicles A82-27231
Computer-program model for predicting horizontally and vertically polarized VLF atmospheric radio noise at elevated receivers [AD-A109448] N82-20384
Conformal antenna array design handbook [AD-A110091] N82-21403
AIRCRAFT BRAKES
Correlation of wear with oxidation of carbon-carbon composites A82-27060
AIRCRAFT CARRIERS
Naval Air Systems Command /NAVAIR/ ATE program - Standardized ATE for the carrier environment A82-27892
AIRCRAFT COMPARTMENTS
Reduction of structural vibration by a dynamic absorber --- helicopter cabins [RAE-TM-AERO-1881] N82-21190
AIRCRAFT CONFIGURATIONS
Large scale model measurements of airframe noise using cross-correlation techniques A82-26966
Why twin-fuselage aircraft A82-28276
AIRCRAFT CONSTRUCTION MATERIALS
Materials and aeronautics A82-26035
Sikorsky tail rotor - 1980: Advanced manufacturing and quality control techniques A82-26390
CH-47 fiberglass rotor blade design and fabrication A82-26397
Effects of lightning and nuclear electromagnetic pulse on an advanced composites aircraft A82-27194
Application of advanced composite materials to helicopter airframe structures A82-27152

FATIGUE TESTS
Sonic fatigue testing of an advanced composite aileron
[AIAA PAPER 81-0634] A82-26567
Sensitivity of bonded and bolted joints in composites to load/environmental spectrum variations --- in fighter aircraft structures
A82-27158

FEASIBILITY ANALYSIS
AEWTS - Realistic not futuristic --- Advanced Electronic Warfare Test Set
A82-27887

FEEDBACK CONTROL
Identification of multivariable high performance turbofan engine dynamics from closed loop data
[NASA-TM-82785] N82-20339
Optimal terrain-following feedback control for advanced cruise missiles
[AD-A110286] N82-21179
Dynamic response of a hot gas, control-surface actuator --- for an aircraft rudder
[MBB-UA-599/81-OE] N82-21219

FIBER OPTICS
A preliminary investigation of Individual Blade-control Independent of a Swashplate
A82-26382

FIBER REINFORCED COMPOSITES
Materials and aeronautics
A82-26025
Fibrous composites in structural design --- Book
A82-27126
Composite aircraft structures
A82-27127
A crashworthiness test for composite fuselage structure
A82-27139
Mechanically-fastened joints for advanced composites - Phenomenological considerations and simple analyses
A82-27156
Use of composite materials for helicopter rotor blades
[PB82-124041] N82-21191
Advanced concepts for composite structure joints and attachment fittings. Volume 1: Design and evaluation
[AD-A110212] N82-21261
Study of noise reduction characteristics of composite fiber-reinforced panels, interior panel configurations, and the application of the tuned damper concept
[NASA-CR-168745] N82-21999

FIGHTER AIRCRAFT
Yak-36 Forger - The brand X VTOL fighter
A82-26045
US Navy begins slow shuffle towards V/STOL
A82-28311
Acoustic measurements of F-4E aircraft operating in hush house, NSN 4920-02-070-2721
[AD-A109827] N82-21041
Numerical aircraft design using 3-D transonic analysis with optimization. Volume 1: Executive summary
[AD-A110035] N82-21180
Numerical aircraft design using 3-D transonic analysis with optimization, volume 2. Part 1: Transport design
[AD-A110231] N82-21181
Numerical aircraft design using 3-D transonic analysis with optimization, volume 3. Part 1: User's guide to transport design computer programs
[AD-A110232] N82-21183
Vibration qualification of external aircraft stores and equipment
[MBB-FE-173/S/PUB/46] N82-21218
Minutes of physical configuration audit for the F-16 Electronic Warfare Training Device
[AD-A110321] N82-21222
Non-destructive inspection and the implementation of a damage tolerant design philosophy --- fighter aircraft
[RAE-TM-STRUCT-982] N82-21601

FILLERS
Effects of filler materials upon radome rain erosion performance at subsonic conditions
A82-26462

FINITE ELEMENT METHOD
Torsional vibrations of non-uniform rotating blades with attachment flexibility
A82-26313
Vibration of structures excited acoustically
N82-20383
Application of the finite element method to rotary wing aeroelasticity
[NASA-CR-165854] N82-20561
Elastic-plastic finite-element analyses of thermally cycled double-edge wedge specimens
[NASA-TP-1973] N82-20566

FITTINGS
Advanced concepts for composite structure joints and attachment fittings. Volume 1: Design and evaluation
[AD-A110212] N82-21261

FLAME STABILITY
The effect of the shape of a body on the efficiency of its utilization as a flame stabilizer
A82-26483

FLAMMABILITY
Full-scale flammability test data for validation of aircraft fire mathematical models
[NASA-TM-58244] N82-21166

FLAPPING
Selection of some rotor parameters to reduce pitch-roll coupling of helicopter flight dynamics
A82-26383

FLAPPING HINGES
Dynamic stability of low effective flap hinge BMR concepts
A82-26377

FLAT PLATES
The effect of the shape of a body on the efficiency of its utilization as a flame stabilizer
A82-26483
Stability of boundary layers with porous suction strips: Experiment and theory
N82-20152

FLEXIBLE BODIES
Application of combined balancing methods to flexible rotors of aviation gas-turbine engines
A82-26491

FLIGHT ALTITUDE
Optimization of thrust algorithm calibration for Computing System (TCS) for Thrust the NASA Highly Maneuverable Aircraft Technology (HiMAT) vehicle's propulsion system
[NASA-CR-163121] N82-21198

FLIGHT CHARACTERISTICS
Performance improvements with the free-tip rotor
A82-26387
Flying qualities - A costly lapse in flight-control design
A82-28280
Advancing blade flight data gathered
A82-28312
The characteristics and detection of low level wind shear in the critical phases of flight
A82-28399

FLIGHT CONDITIONS
Communicating critical weather information to pilots --- (ZITLE)
[AIAA PAPER 82-0016] A82-27082
Meteorological impact on aviation fuel efficiency
N82-21140
The Joint Airport Weather Studies Project
N82-21152
Generic Test Bed (GTB) aircraft
[AD-A110335] N82-21176

FLIGHT CONTROL
Composite control tubes
A82-27423
Flying qualities - A costly lapse in flight-control design
A82-28280
Real-time failure detection of aircraft engine output sensors
A82-28403
Development of longitudinal equivalent system models for selected US Navy tactical aircraft
[AD-A109488] N82-20189
Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts
[AD-A109585] N82-20190

Integration of controls and displays in U.S. Army helicopter cockpits [AD-A109594] N82-20191
Operational procedures relative to severe weather N82-21142
Digital command augmentation for lateral-directional aircraft dynamics [AD-A110274] N82-21214

FLIGHT HAZARDS
Communicating critical weather information to pilots --- (TITLE) [AIAA PAPER 82-0016] A82-27082
The characteristics and detection of low level wind shear in the critical phases of flight A82-28349
Aircraft pitch attitude as a performance parameter A82-28519

FLIGHT MECHANICS
Air Force Academy aeronautics digest Fall/Summer 1980 [AD-A108338] N82-20139

FLIGHT OPERATIONS
The effects of weather on runway operations A82-27050
Operational procedures relative to severe weather N82-21142

FLIGHT OPTIMIZATION
Fuel optimal trajectory computation A82-26568

FLIGHT PATHS
Fuel optimal trajectory computation A82-26568
Design criteria for flightpath and airspeed control for the approach and landing of STOL aircraft [NASA-TP-1911] N82-20187

FLIGHT PLANS
Modernizing air traffic control in France A82-27048
Weather deterioration models applied to alternate airport criteria [AD-A108877] N82-20811
Meteorological impact on aviation fuel efficiency N82-21140
Ozone and aircraft operations N82-21145

FLIGHT SAFETY
Detection and tracking algorithm refinement [AD-A109517] N82-20164
Proceedings: Fifth Annual Workshop on Meteorological and Environmental Inputs to Aviation Systems [NASA-CP-2192] N82-21139
Operational procedures relative to severe weather N82-21142
Prototype Regional Observation and Forecast System (PROFS) N82-21150

FLIGHT SIMULATION
Aerial combat simulation in the U.S. Air Force A82-27920
Flying qualities - A costly lapse in flight-control design A82-28280
Effect of contrast on space perception in TV displays of the external scene observed by the pilot --- German book A82-28395
Simulation of the XV-15 tilt rotor research aircraft [NASA-TM-84222] N82-20174
Simulator study of a pictorial display for general aviation instrument flight [NASA-TP-1963] N82-20180
Design of a catadioptric VCASS helmet-mounted display [AD-A109431] N82-20181
Rotorcraft flight simulation computer program C81 with DATAMAP interface. Volume 1: User's manual [AD-A108246] N82-20194
Aerodynamics project. Significance and difficulties in the experimental and numerical simulation of complex flow processes with high Reynolds number as part of aircraft projects --- wind tunnel utilization [MBB-FE-120/S/PUB/33] N82-21162
The 1981 Image 2 Conference Proceedings [AD-A110226] N82-21223

FLIGHT SIMULATORS
Heavy rain penalties for a flight simulator [AIAA PAPER 82-0213] A82-27093
Study and design of high G augmentation devices for flight simulators [AD-A109127] N82-20195
Meteorological inputs to advanced simulators N82-21141
Computer generated images for aircraft pilot training --- MRCA aircraft [MBB-UA-551/80-OE] N82-21229

FLIGHT TEST VEHICLES
Generic Test Bed (GTB) aircraft [AD-A110335] N82-21176

FLIGHT TESTS
Experimental program for general aviation --- wing design, construction and flight testing A82-26542
One year flight testing of the Transonic Wing A82-26543
NOTAR A82-26822
Advanced medium scale real-time system --- for Army helicopter tests A82-27187
Flight service evaluation of advanced structures A82-27402
Advancing blade flight data gathered A82-28312
Preliminary airworthiness evaluation of the UH-1H with hot metal plus plume infrared suppressor and infrared jammer [AD-A110213] N82-21177
A preliminary comparison between the SR-3 propeller noise in flight and in a wind tunnel [NASA-TM-82805] N82-21998

FLIGHT TIME
Optimum three-dimensional flight of a supersonic aircraft A82-26039

FLIGHT VEHICLES
Problems in the automation of the thermal-stress analysis of flight vehicles A82-27509

FLIR DETECTORS
The 1981 Image 2 Conference Proceedings [AD-A110226] N82-21223

FLOW CHARACTERISTICS
The effect of induced sound on the flow around a rectangular body in a wind tunnel A82-26194

FLOW DISTORTION
Comments on 'Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery rotor noise' A82-26320

FLOW DISTRIBUTION
The vortex flow field generated by a hovering helicopter A82-26227
Numerical solution of Space Shuttle Orbiter flow field [AIAA PAPER 82-0028] A82-27083
Experimental study of the flowfield of an airfoil with deflected spoiler [AIAA PAPER 82-0126] A82-27086
Experimental methods for the prediction of the effect of viscosity on propeller performance [AD-A109846] N82-20472

FLOW GEOMETRY
Self streamlining wind tunnels without computers A82-26181
Determination of losses in a channel with a sudden expansion behind a diffusor A82-26492

FLOW MEASUREMENT
Experimental investigation of turbine endwall heat transfer. Volume 2: Linear and annular cascade summary data sets [AD-A110333] N82-21200

FLOW VELOCITY
An experimental study of steady and quasi-steady jet flaps A82-26222
The relative motion of a particle in the case of exponential changes of the velocity of the medium A82-26479

Helicopter rotor performance improvement by utilization of swept back parabolic blade tip
A82-26298
Torsional vibrations of non-uniform rotating blades with attachment flexibility
A82-26313
The Model 412 multi-bladed rotor system
A82-26376
The general purpose research rotor - Design features and considerations
A82-26379
CH-46 and CH-47 composite rotor blade lightning protection testing
A82-26381
A preliminary investigation of Individual Blade-control Independent of a Swashplate
A82-26382
Selection of some rotor parameters to reduce pitch-roll coupling of helicopter flight dynamics
A82-26383
CH-46 fiberglass rotor blade repair program
A82-26384
A survey of U.S. Army helicopter main and tail rotor blade obstacle strikes
A82-26385
Performance improvements with the free-tip rotor
A82-26387
Operational experience with the fiberglass rotor blade
A82-26388
ICOPTER KEVLAR
A82-26389
SH-60P Seahawk automatic blade fold system
A82-26391
The impact of missions on the preliminary design of an ABC rotor
A82-26392
Main rotor hub electromagnetic signature reduction
A82-26393
Evaluation of the effect of elastomeric damping material on the stability of a bearingless main rotor system
A82-26394
Rotor preliminary design trade-offs for the Advanced Scout Helicopter
A82-26395
Performance and aeroelastic tradeoffs on recent rotor blade designs
A82-26396
CH-47 fiberglass rotor blade design and fabrication
A82-26397
Black Hawk rotor de-icing
A82-26398
The Circulation Control Rotor /CCR/ control system
A82-26400
Helicopter vibration suppression using simple pendulum absorbers on the rotor blade
A82-26620
NOTAR
A82-26822
Design and production of fiberglass helicopter rotor blades
A82-27153
A surface singularity method for rotors in hover or climb
[AD-A109687] N82-20178
Application of the finite element method to rotary wing aeroelasticity
[NASA-CR-165854] N82-20561
Helicopter rotor loads using a matched asymptotic expansion technique
[NASA-CR-165742] N82-21156
Aeroelastic analysis of the elastic gimbal rotor
[NASA-CR-166287] N82-21157
Computation of wing-vortex interaction in transonic flow using implicit finite difference algorithm
[NASA-CR-166251] N82-21159
Rational production methods for the manufacture of helicopter rotor blades --- BO-105 helicopter
[MBB-UD-312/80-OE] N82-21188
Use of composite materials for helicopter rotor blades
[PB82-124041] N82-21191

ROTATING DISKS
Aeroelastic characteristics of a mistuned bladed-disc assembly
N82-20142
A retirement-for-cause study of an engine turbine disk
[AD-A109724] N82-20184

ROTOR AERODYNAMICS
Sensitivity of helicopter aeromechanical stability to dynamic inflow
A82-25773
The vortex flow field generated by a hovering helicopter
A82-26227
Helicopter rotor performance improvement by utilization of swept back parabolic blade tip
A82-26298
Design for the operating environment - Ring-fin tail rotor program
A82-26378
Performance improvements with the free-tip rotor
A82-26387
Design optimization of rotor systems for tilt-rotor aircraft that fold for shipboard compatibility
A82-26399
The Circulation Control Rotor /CCR/ control system
A82-26400
Advancing blade flight data gathered
A82-28312
A surface singularity method for rotors in hover or climb
[AD-A109687] N82-20178
Application of the finite element method to rotary wing aeroelasticity
[NASA-CR-165854] N82-20561

ROTOR BLADES
A generalized Hill's method for the stability analysis of parametrically excited dynamic systems
A82-25923
CH-46 fiberglass rotor blade repair program
A82-26384

ROTOR BLADES (TURBOMACHINERY)
Comments on 'Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery rotor noise'
A82-26320

ROTORCRAFT AIRCRAFT
NASA/Lewis Research Center Icing Research Program
N82-21148

ROTORS
Application of combined balancing methods to flexible rotors of aviation gas-turbine engines
A82-26491
Preliminary design of an advanced composite rotor hub for the UH-60A Black Hawk
A82-27154
Approach to the fatigue analysis of vertical-axis wind-turbine blades
[DE82-003193] N82-20573
Research on turbine rotor-stator aerodynamic interaction and rotor negative incidence stall
[AD-A110341] N82-21203

RUNWAY CONDITIONS
The effects of weather on runway operations
A82-27050
Weather deterioration models applied to alternate airport criteria
[AD-A108877] N82-20811

RUNWAYS
Overview of the O'Hare Runway configuration management system
[AD-A110137] N82-21224

S

SA-330 HELICOPTER
Industrial experience in the Anglo-French helicopter collaboration
[SNIAS-811-210-101] N82-21154

SAFETY DEVICES
Variable response load limiting device --- for aircraft seats
[NASA-CASE-LAR-12801-1] N82-20544

SANDWICH STRUCTURES
Impact resistance of graphite and hybrid configurations
A82-27141
SPF/DB titanium concepts for structural efficiency foi HC
N82-20154
SPF/DB titanium LFC porous panel concept
N82-20155

SCALING LAWS
Model helicopter rotor low frequency broadband noise
A82-25772
SEALS (STOPPERS)
Rub energetics of compressor blade tip seals
A82-27078
Service sensitivity of polysulfide sealants
A82-27407
SEARCH RADAR
Analysis of side-looking airborne radar /SLAR/ performance in the detection of search and rescue targets
A82-27641
SEAT BELTS
Evaluation of a proposed modified F/FB-111 crew seat and restraint system
[AD-A110168] N82-21167
SEATS
Variable response load limiting device --- for aircraft seats
[NASA-CASE-LAR-12801-1] N82-20544
Evaluation of a proposed modified F/FB-111 crew seat and restraint system
[AD-A110168] N82-21167
SELF ADAPTIVE CONTROL SYSTEMS
Self-tuning regulators for multicyclic control of helicopter vibration
[NASA-TP-1996] N82-20188
SELF INDUCED VIBRATION
The effect of induced sound on the flow around a rectangular body in a wind tunnel
A82-26194
SELF OSCILLATION
Suppression of self-oscillations in open wind tunnels
A82-25794
SENSORS
Real-time failure detection of aircraft engine output sensors
A82-28403
SEPARATED FLOW
Some remarks on buffeting --- of wings, wind tunnel models
[RAE-TM-STRUCT-980] N82-21216
SERVICE LIFE
Introduction to the principles of fracture mechanics
A82-25550
Evaluation of crack growth gages for service life tracking
A82-26652
Problems and options in advanced composite repair
A82-27145
SHEAR FLOW
High frequency sound emission from moving point multipole sources embedded in arbitrary transversely sheared mean flows
A82-26318
Unsteady response of rectangular wings in spanwise uniform shear flow
A82-26340
SHEAR STRENGTH
Compatibility of 350 deg curing honeycomb adhesives with phosphoric acid anodising
A82-27414
SHEAR STRESS
More than meets the eye - The oil dot technique
A82-27114
SHIELDING
Some applications of Hartmann-type sources in aircraft noise research --- airframe shielding
[RAE-TM-AERO-1877] N82-22007
SHOCK ABSORBERS
Variable response load limiting device --- for aircraft seats
[NASA-CASE-LAR-12801-1] N82-20544
SHOCK WAVES
Helicopter rotor performance improvement by utilization of swept back parabolic blade tip
A82-26298
SHORT TAKEOFF AIRCRAFT
US Navy begins slow shuffle towards V/STOL
A82-28311
A short takeoff performance computer program
[AD-A109861] N82-20179
Design criteria for flightpath and airspeed control for the approach and landing of STOL aircraft
[NASA-TP-1911] N82-20187
SIDE-LOOKING RADAR
Analysis of side-looking airborne radar /SLAR/ performance in the detection of search and rescue targets
A82-27641
SIGNAL FADING
Terrain reflection effects on data reception from airborne vehicles
A82-27231
SIGNAL PROCESSING
Integration of multi-sensor navigation data using optimal estimation techniques
A82-25577
SIGNAL RECEPTION
Terrain reflection effects on data reception from airborne vehicles
A82-27231
SIGNAL REFLECTION
UTD terrain reflection model with application to ILS glide slope
N82-20166
SIZE DETERMINATION
Rotor preliminary design trade-offs for the Advanced Scout Helicopter
A82-26395
SKIN (STRUCTURAL MEMBER)
Fracture control in ballistic-damaged graphite/epoxy wing structure
A82-26639
SLENDER WINGS
Vortex flow correlation --- water tunnel tests on thin slender wings
[AD-A108725] N82-20468
SLIDING FRICTION
Rub energetics of compressor blade tip seals
A82-27078
SOLAR FURNACES
Duplication of radome aerodynamic heating using the Central Receiver Test Facility solar furnace
A82-26468
SONIC BOOMS
Assessment of community response to high-energy impulsive sounds
[AD-A110110] N82-21777
SOUND PRESSURE
Model helicopter rotor low frequency broadband noise
A82-25772
Acoustic measurements of F-15 aircraft operating in hush house, NSN 4920-02-070-2721
[AD-A109828] N82-21042
Acoustic measurements of F-16 aircraft operating in hush house, NSN 4920-02-070-2721
[AD-A109829] N82-21043
SOUND PROPAGATION
High frequency sound emission from moving point multipole sources embedded in arbitrary transversely sheared mean flows
A82-26318
SOUND TRANSMISSION
Acoustic measurements of F-15 aircraft operating in hush house, NSN 4920-02-070-2721
[AD-A109828] N82-21042
SPACE PERCEPTION
Effect of contrast on space perception in TV displays of the external scene observed by the pilot --- German book

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering – A Continuing Bibliography* (NASA SP-7037) lists 362 reports, journal articles, and other documents originally announced in July 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes – subject, personal author, and contract number – are included.

An annual cumulative index will be published.

optimum of operational safety, and design and constructional details. The various types of operations for which the BK117 has been employed are discussed, giving attention to specific data regarding the weight relations in each case. G.R.

A82-29592 F-15 fighter abilities evaluated. R. R. Ropelewski. *Aviation Week and Space Technology,* vol. 116, Apr. 26, 1982, p. 39-43, 45, 46.

Modifications, features, and operations of the F-15 in an all weather air-to-ground capability configuration are described. The rear cockpit has been outfitted with four multifunction CRT displays, the mission computer memory has been expanded by 50%, updates in the inertial navigation are now high velocity, and integration of the FLIR and laser ranging system has been accomplished. The total program took a year and a half, and successful demonstration ground strikes are detailed. Specific attention is given to lock-on and forget radar systems and digital menus for calling up enlargements of displayed scenes on the CRT. Images lost during maneuvers could be restored by recycling the computer. The controlled maneuverability of the aircraft is stressed, as are necessities for calibrating the radar systems, proving the sensors, and testing a variety of munitions. M.S.K.

A82-29596 * Test methodology for evaluation of fireworthy aircraft seat cushions. D. A. Kourtides and J. A. Parker (NASA, Ames Research Center, Chemical Research Projects Office, Moffett Field, CA). *Journal of Fire and Flammability,* vol. 13, Jan. 1982, p. 56-76. 8 refs. FAA-sponsored research.

Aircraft seat materials were evaluated in terms of their thermal performance. The materials were evaluated using (a) thermogravimetric analysis, (b) differential scanning calorimetry, (c) a modified NBS smoke chamber to determine the rate of mass loss and (d) the NASA T-3 apparatus to determine the thermal efficiency. In this paper, the modified NBS smoke chamber will be described in detail since it provided the most conclusive results. The NBS smoke chamber was modified to measure the weight loss of materials when exposed to a radiant heat source over the range of 2.5 to 7.5 W/cm sq. This chamber has been utilized to evaluate the thermal performance of various heat blocking layers utilized to protect the polyurethane cushioning foam used in aircraft seats. Various kinds of heat blocking layers were evaluated by monitoring the weight loss of miniature seat cushions when exposed to the radiant heat. The effectiveness of aluminized heat blocking systems was demonstrated when compared to conventional heat blocking layers such as neoprene. All heat blocking systems showed good fire protection capabilities when compared to the state-of-the-art, i.e., wool-nylon over polyurethane foam. (Author)

A82-29597 An evaluation study of aluminide and chromoaluminide coatings on IN-100. R. Sivakumar (Defence Metallurgical Research Laboratory, Hyderabad, India). *Oxidation of Metals,* vol. 17, Feb. 1982, p. 27-41. 21 refs.

Aluminide and chromoaluminide diffusion coatings on IN-100, a cast Ni-base superalloy, have been investigated under laboratory conditions with reference to their structure and protective properties. The observed differences in the cyclic oxidation and hot corrosion behavior of the coatings are rationalized in terms of the coating chemistry, and in particular, Cr and Al contents in the outer layers. The results obtained provide a way to predict the performance of NiAl-base coatings on Ni-base alloys. V.L.

A82-29659 # Crossflow shock on the suction side of a flat delta wing with supersonic leading edges. S. Kubo and T. Fujimoto (Kyoto University, Kyoto, Japan). *(Asian Congress of Fluid Mechanics, Ist, Bangalore, India, Dec. 8-13, 1980). Japan Society for Aeronautical and Space Sciences, Transactions,* vol. 24, Feb. 1982, p. 211-221. 11 refs.

A theoretical investigation is made on the crossflow shock on the suction side of a flat delta wing with supersonic leading edges in a uniform supersonic flow. An extension of the analytic characteristic method is carried out for a three dimensional inviscid flow past a wing. Special care is taken in the treatment of the boundary conditions at the leading edge, at which there is a centered simple expansion wave. A crossflow shock is analyzed on the wing surface. It is found that a weak crossflow shock appears under every condition of the angle of attack and sweepback angle of the leading edge. The location and the strength of the shock are compared with those of available experimental and numerical results. They are compatible with each other within the accuracy of the present analysis. (Author)

A82-29714 Sea-based remotely piloted vehicles. I - Issues and concepts. C. Henderson (Institute for Defense Analyses, Alexandria, VA). *Military Electronics/Countermeasures,* vol. 8, Apr. 1982, p. 61-64.

Remotely piloted vehicles (RPVs) in the 10,000-15,000 lb class, equipped with radar and designed to operate from a variety of naval vessels, are proposed as long-range early warning platforms for carrier battle groups. Consideration is given to the inherent potential of RPVs for such missions as command, control and communications (C3), surface surveillance, anti-air warfare, antisubmarine warfare and electronic warfare. It is noted that the RPV payload weight plays an important role in determining the propulsion system thrust required, takeoff and landing modes, and the fuel volume needed for a mission of given duration. While C3 RPVs would be equipped with communication gear and early warning RPVs with powerful search radars, all RPVs would carry data link hardware for command and control and sensor data transmissions. Attention is given to the use of conformal radar arrays, which are shaped to the contour of the aircraft skin. O.C.

A82-29773 Computational aerodynamics - Its coming of age and its future. L. R. Miranda (Lockheed-California Co., Burbank, CA). *Lockheed Horizons,* Spring 1982, p. 14-24.

Current capabilities of computational aerodynamics are examined and an attempt is made to assess its future role in aircraft design. Computational aerodynamics is the numerical solution of equations of motion of fluids using digital computers and subsequent simulation of the corresponding aerodynamic flowfields. Simulations are noted to be significant for performance, design, and safety of aircraft. Fields of numerical analysis, aerodynamic theory, and computer technology are combined to produce the numerical simulation, with the projected flowfields being generated by solutions to the Navier-Stokes equations in the form of increasingly closer approximations. Panel methods, a simplified form of the full solution, are explored, and their ability to remain computationally efficient with complex geometries is stressed. Advances in computer technology are foreseen to enhance the option of using full Navier-Stokes equations for high-speed aerodynamic simulations. M.S.K.

A82-29774 Fuel efficient and Mach 0.8, too. W. E. Arndt (Lockheed-Georgia Co., Marietta, GA). *Lockheed Horizons,* Spring 1982, p. 26-34.

Principles of propfan technology and problems which must be solved for the introduction of propfans to production aircraft are discussed. The Hamilton-Standard concept, introduced in 1975, includes thin profile, swept-back multiple blades (8-10) suitable for cruise speeds of Mach 0.8 with 15-20% less fuel consumption than currently available with turbofans. Studies in loading fatigue are necessary to determine if the cyclic loading caused by high-speed swept back wings will adversely affect the integrity of composite-material propfans. Additional areas of concern are effects on the aerodynamic efficiency of aircraft induced by the presence of multibladed propfans, and the necessity of adding noise-reducing materials to maintain satisfactory cabin noise levels is a potential weight penalty factor. NASA trials on a converted Jetstar are described, along with possible techniques to reduce near- and farfield noise levels. M.S.K.

A82-29789 Aerodynamics at the 1981 Le Bourget show (L'aérodynamique au Salon du Bourget 1981). L. Rosenthal (Centre de Documentation de l'Armement, Paris, France). *L'Aéronautique et l'Astronautique,* no. 92, 1982, p. 37-56. 20 refs. In French.

Applications of the current state of the art in aircraft aerodynamics and general tendencies in the development of the field as manifested at the 23rd International Air and Space Show at Le Bourget in 1981 are considered. Among the new aircraft presented at the show, the most original include the Transavia T 300 Sky Farmer, the Edgley EA7 Optica three-seat observation plane and the NASA Bell XV-15 experimental STOL craft. Configurations receiving significant attention at the show were those with winglets, canards and strakes, especially on military aircraft, leading edge flaps, the remotely piloted HiMAT aircraft and aircraft with forward-swept wings. Developments in propulsion aerodynamics involved air intakes, streamlined and multi-bladed propellers and the prop-fan. The importance of developments in composite materials, propulsion and systems to the realization of these aerodynamic configurations is emphasized. A.L.W.

A82-29792 **Laser gyros - The guiding light.** J. Hecht. *High Technology*, vol. 2, May-June 1982, p. 24, 26-28.

The key advantages of laser gyros over mechanical gyroscopes are the absence of moving parts and lower cost. The laser gyro is a rotation sensor consisting of a rotating ring in which intense monochromatic light going in both directions is generated by the excitation of an active medium in an optical resonator defined by three or more mirrors. Rotating the ring laser changes the effective resonator length so that the frequency of one beam is upshifted and the other downshifted. Turning a typical ring laser by 10 degrees per hour will cause a detectable frequency shift of a few hertz. A number of approaches have been taken to solve the systems's main problem, the tendency of the beams to lock together at the same frequency when the rotation rate is very small. Optical fiber gyros may find use in systems where cost and compactness rather than accuracy are the chief consideration. C.D.

A82-29793 **Future auto engines - Competition heats up.** C. Rain. *High Technology*, vol. 2, May-June 1982, p. 39-47.

The conventional internal combustion engine will remain an important factor in future automobile engines because it is perfectly suited to the widely varying conditions of city and highway driving, and engineers continue to eke out design advances. Diesels will continue to make strong gains in the near term because of their fuel economy advantage, but their emissions and fuel requirement problems are serious. Stratified charge engines could challenge the diesel because they satisfy governmental goals and would require the lowest retooling costs. Their multifuel capability gives them long-term viability. The gas turbine and the Stirling offer the best fuel economies and are clean-burning, and both run on a wide range of fuels. The Stirling requires engineering to improve its power density and to cut costs, while the gas turbine needs a breakthrough in durable high-temperature ceramics. C.D.

A82-29800 **Handling air freight in the 1980s - Meeting the challenge.** P. L. Peoples and V. Sweetland (Boeing Commercial Airplane Co., Renton, WA). *Aircraft Engineering*, vol. 54, Mar. 1982, p. 7-10.

Flight hardware and ground system development areas which are necessary to meet the expected growth in air cargo in the 1980 decade are reviewed. Boeing has undertaken studies involving full-scale mock-ups of the 767 and 757 and various cargo loads to attempt optimization of cargo pallets, container shapes, and handling procedures in moving freight. The large cargo-handling capacity of the 747 is outlined, noting the commonality designed into the cargo configurations for the 767 and 747. Freight and baggage handling procedures have been observed to have divergent requirements, although the LD-4 pallet offers an opportunity for the most efficient loading of either. Cargo and baggage packaging within standardized modules for loading on pallets is asserted to offer 95-97% space utilization. M.S.K.

A82-29820 † **The stressed state of a parachute canopy during opening (Napriazhennoe sostoianie kupola parashiuta pri raskrytii).** G. N. Gaiubov (Tashkentskii Politekhnicheskii Institut, Tashkent, Uzbek SSR). *Akademiia Nauk Uzbekskoi SSR, Doklady*, no. 1, 1982, p. 12-14. 5 refs. In Russian.

A82-29826 † **Optimization of measurements in the state estimation of systems using the least squares method (Optimizatsiia sostava ispol'zuemykh izmerenii v zadachakh otsenivaniia sostoianiia sistem metodom naimen'shikh kvadratov).** L. G. Ambartsumov. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 3-6. 5 refs. In Russian.

Problems of the state estimation of aircraft systems are characterized by a large quantity of information to be processed. This results in an increase in the cost of computations, a decrease in the reliability of the results, and an increase in data processing time. For this reason it is necessary to limit the number of measurements. This paper gives a mathematical formulation and examines the characteristics of the optimization of the number and character of measurements made in the problem of state estimation using the least squares method in the case of an arbitrary matrix of measurements. B.J.

A82-29827 † **The stability of maneuverable flight vehicles (K ustoichivosti manevrennykh letatel'nykh apparatov).** A. B. Aminov. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 7-11. 5 refs. In Russian.

A method is developed for obtaining the region of asymptotic stability in the coefficient space of the nonlinear differential equations of the perturbed motion of a maneuverable flight vehicle. As an example, an analysis is presented of the stability of the longitudinal motion of a flight vehicle with large attack-angle deviations. B.J.

A82-29828 † **Comparison of light aircraft with strutted and cantilever wings (Sravnenie legkikh samoletov s podkosnym i svobodnonesushchim krylom).** A. A. Badiagin. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 11-17. 5 refs. In Russian.

A general formula for the analysis of the mass of strutted and cantilever wings of light aircraft is proposed. Optimal aspect ratio is analyzed, and a formula for determining the maximum flight velocity of a strutted-wing aircraft is presented. The strutted wing is found to be somewhat more cost effective than the cantilever wing. B.J.

A82-29829 † **Design principles of a computer-aided design system (Printsipy postroeniia sistemy mashinnogo konstruirovaniia).** Iu. V. Davydov, A. A. Zazhigin, and V. A. Osipov. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 17-22. 11 refs. In Russian.

The structure and basic features of a computer system for the design of flight vehicles are described. Particular attention is given to mathematical models for the description of wing contours, the determination of external loads, strength analyses, the determination of the geometric characteristics of the components, the graphics system, and the formation of control programs. The input and output parameters of each module of the system are discussed. B.J.

A82-29831 † **Investigation of the aerodynamic-contour method with control functions in the form of smooth constant-sign contours (Issledovanie metoda aerodinamicheskogo kontura s upravliaiushchimi funktsiiami v vide gladkikh obvodov postoiannogo znaka).** R. Kh. Akhatov and V. A. Osipov. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 27-31. In Russian.

A modified aerodynamic-contour method is developed which is based on the use of a control function in the form of smooth contours of constant sign. This makes it possible to obtain a mathematical model for a profile curve with normalized constancy of sign and a wide range of variation of the input information. The method is convenient for controlling profile shape and produces a considerable savings in machine time. B.J.

A82-29832 † **Estimation of the performance of nonstationary discontinuous control systems for flight vehicles (Otsenka effektivnosti nestatsionarnykh razryvnykh sistem upravleniia letatel'nykh apparatov).** E. A. Kuklev. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 37-41. In Russian.

The paper examines a linear dynamic system with discontinuous controls conditioned by changes in the operational modes of the system at random moments of time. An analytical method is proposed for determining the averaged values of the performance functionals of the system, with allowance for a finite number of discontinuities. B.J.

A82-29834 † **Analysis of a multihinged empennage with allowance for shear strain (Raschet mnogosharnirnogo opereniia s uchetom deformatsii sdviga).** V. A. Pavlov and V. A. Portnoi. *Aviatsionnaia Tekhnika*, no. 4, 1981, p. 46-51. In Russian.

A method for analyzing a multihinged empennage is presented, wherein the shear displacements included in the resolvent compatibility equations are determined by the Timoshenko method. Analysis results are presented on the empennage of an actual aircraft, and the necessity of taking into account shear strain of the control surface and stabilizer in their own plane is found to be confirmed. B.J.

Jan. 1982 9 p refs

Avail: NTIS HC A08/MF A01

An engine part retirement for cause (RFC) procedure is discussed which would allow safe utilization of the full life capacity of each individual component. Since gas turbine rotor components are prime candidates and are among the most costly of engine components, adoption of a RFC maintenance philosophy could result in substantial engine systems life cycle cost savings. Two major technical disciplines must be developed and integrated to realize these cost savings: fracture mechanics and nondestructive evaluation. The methodology and development activity required to integrate these disciplines that provide a viable RFC system for use on military gas turbine engines is discussed. The potential economic benefits of its application to a current engine system are also illustrated. M.G.

DEFECTS AND THEIR EFFECT ON THE BEHAVIOR OF GAS TURBINE DISCS
Robert H. Jeal *In* AGARD Maintenance in Serv. of High Temp. Parts Jan. 1982 15 p

Avail: NTIS HC A08/MF A01

Unless the method used to life fatigue critical components like gas turbine discs allows assessment of defect presence and behavior, the risk of serious failure is dramatically increased. A method is discussed where defect behavior can be assessed as part of a total life approach to disc behavior prediction and is explained together with the effects of differing defect types. Such an approach gives realistic manufacturing standards and controls and leads directly to an 'on condition life' approach. Author

THE INFLUENCE OF PROTECTIVE TREATMENT ON THE MECHANICAL PROPERTIES OF SUPERALLOY PARTS [INFLUENCE DES TRAITEMENTS DE PROTECTION SUR LES PROPRIETES MECANIQUES DES PIECES EN SUPERALLIAGE]
J. M. Hauser, C. Durat, and R. Pichoir *In* AGARD Maintenance in Serv. of High Temp. Parts Jan. 1982 11 p refs In FRENCH
Avail: NTIS HC A08/MF A01

The high temperature environment of aircraft turbine engines requires the use of protective coatings for engine parts. These coatings are particularly necessary when the composition of the superalloys used and associated heat treatment are chosen in order to obtain the best mechanical properties. The durability of these components is determined not only by the mechanical properties of the protected heat resistance alloys, but equally by the resistance of the coating to oxidation and corrosion. To restore this protection can pose diverse problems and, in certain cases, constitute an additional factor in reducing fatigue life. These aspects are considered and illustrated by results obtained from aluminium coatings applied to IN 100 and IN 738LC superalloys. Factors inherent i to t elaboration of the protection are also considered. Transl. by A.R.H.

REPAIR AND REGENERATION OF TURBINE BLADES, VANES AND DISCS
H. Huff and J. Wortmann *In* AGARD Maintenance in Serv. of High Temp. Parts Jan. 1982 7 p refs

Avail: NTIS HC A08/MF A01

The repair of incipiently cracked turbine components is essentially limited to non-rotating parts. Repairs to rotating parts are carried out on low-stressed areas, such as seals, only. In this case, weld build-up has proved to be a suitable process. Stator vanes can be high-temperature brazed following reduction annealing. However, problems are encountered when it comes to making sure of the complete removal of oxides. A highly promising method for increasing the reliability of turbine blades that have been in service lies in their regeneration by heat treatment or HIP-processing. Results to date are so positive that the use of regenerated blades may be a reality in the near future. However, a prerequisite for the use of these repair procedures is a guarantee of reliability and a knowledge of the stresses that occur during operation. A.R.H.

REVIEW OF PRACTICAL EXPERIENCE ON COMBAT AIRCRAFT MAÑEUVERABILITY
A. W. Henni *In* AGARD Combat Aircraft Maneuverability Dec. 1981 8 p
Avail: NTIS HC A11/MF A01

Based upon practical experience in both air to air and air to ground operations with F-84F, F-104G, and NF-5 fighter aircraft, an assessment is given of the importance of combat aircraft maneuverability. In air to ground operations the effect of limited maneuverability on tactics is treated in terms of speed/altitude and maneuverability requirements during ingress/egress and weapon delivery, in relation to attack effectiveness and survivability against enemy defenses. For air to air operations the parameters that influence the outcome of a maneuvering flight are identified. The relation between maneuverability and tactics is discussed. It is concluded that the impact of maneuveriabilty on mission effectiveness becomes less prominent at increasing total number of air to air capable aircraft, fighting in a limited airspace. Dependent on the type of operation, desirable improvements in maneuverability are discussed with emphasis on turn performance (at low speeds), rapid speed changes and direct force generation. In this context human tolerance limits are taken into account. It is stressed that the main problems confronting a fighter pilot in the Central European environment are not related to maneuverability but to the availability of military subsystems. M.G.

THE MILITARY FLYING QUALITIES SPECIFICATION, A HELP OR A HINDRANCE TO GOOD FIGHTER DESIGN

Ralph C. AHarrah and Robert J. Woodcock (AFWAL, Wright-Patterson AFB, Ohio) *In* AGARD Combat Aircraft Maneuverability Dec. 1981 13 p refs

Avail: NTIS HC A11/MF A01

Based on experience with Air Force and Naval aircraft, the current qualities specification is evaluated for application to a future fighter design. Analog and digital fly by wire flight control system having multiple redundancy levels and significant control law variation are discussed. Some specific observations are shared on the following topics with regard to the flying qualities in general and the specification in particular time delays, force commands, forward loop integration, high gains, signal blending, equivalent systems, pilot location, high angle of attack, roll performance, and systems integration. In addition, some general observations are made on the use of MIL-F-8785B, and a Navy conducted survey on the effectiveness of the flying qualities specification is discussed. M.G.

DEVELOPMENT OF A TENTATIVE FLYING QUALITIES CRITERION FOR AIRCRAFT WITH INDEPENDENT CONTROL OF SIX DEGREES OF FREEDOM: ANALYSIS AND FLIGHT TEST

Roger H. Hoh, Thomas T. Myers, and Irving L. Ashkenas *In* AGARD Combat Aircraft Maneuverability Dec. 1981 12 p refs

(Contract F33615-78-C-3616)

Avail: NTIS HC A11/MF A01

A tentative flying qualities specification for aircraft having direct force effectors that allow independent control over the horizontal and vertical degrees of freedom is presented. Since the primary problem with developing flying qualities for such aircraft is their unconventional responses as reflected in a very incomplete data base. A limited flight test of a direct force control (DFC) aircraft was performed. The requirements are based on fundamental aspects of DFC pilot/vehicle dynamics to insure universal applicability. A bandwidth hypothesis is described which makes the fundamental assumption that the primary factor in the pilot's evaluation of a DFC mode is his ability to exert tight control to minimize errors and thereby achieve improved closed loop tracking performance. The bandwidth is a measure of the maximum frequency at which such closed loop tracking can take place without threatening stability. It follows that airplanes capable of operating at a large value of bandwidth will have superior performance. M.G.

EXPERIMENTAL FLIGHT TEST PROGRAMS FOR IMPROVING COMBAT AIRCRAFT MANEUVERABILITY BY MANEUVER FLAPS AND PYLON SPLIT FLAPS

D. Jacob, D. Welte, and H. Wonnenberg *In* AGARD Combat Aircraft Maneuverability Dec. 1981 11 p refs

Avail: NTIS HC A11/MF A01

Two flight test programs with the Alpha-Jet as test vehicles are described. In the first program the standard wing of the aircraft was replaced by a transonic wing with maneuver flaps. Wind tunnel and flight test results are presented which show the increase in performance and maneuverability based on the improved drag polars and buffet limits. In the second program pylon split flaps were to provide flat turn and side step maneuvers by an alternating deflection of the four left or right split flaps. A drag modulation mode is ralized by symmetrical deflection of all eight flaps. M.G.

MULTIVARIABLE CLOSED LOOP CONTROL ANALYSIS AND SYNTHESIS FOR COMPLEX FLIGHT SYSTEMS

David K. Schmidt *In* AGARD Combat Aircraft Maneuverability Dec. 1981 13 p refs

(Grants NAG4-1; AF-AFOSR-0042-72)

Avail: NTIS HC A11/MF A01

A flight control system analysis and synthesis method is presented that is intended to be especially suitable for application to vehicles exhibiting complex dynamic characteristics. For such vehicles quantitative handling qualities specifications are not usually available. Howver, handling qualities objectives are specifically introduced in this method via the hypothesis of correlation between pilot ratings and the objective function of an optimal control model of the human pilot. Further, since augmentation and pilot operate in parallel, simultaneous determination of the augmentation and pilot model gains is required. Desirable augmented dynamics are obtained for a variety of complex systems and the method is experimentally verified in the case of simple pilot damper gain selection for optimum pitch tracking performance. M.G.

INTEGRATION OF AVIONICS AND ADVANCED CONTROL TECHNOLOGY

M. E. Waddoups and C. A. Anderson *In* AGARD Combat Aircraft Maneuverability Dec. 1981 4 p

Avail: NTIS HC A11/MF A01

Two seemingly exclusive requirements, low cost tactical fighters and night under the weather operations, are being merged by means of advanced technology. The key operational problem is forced by the extremely difficult timeline for low altitude, high speed, air to surface weapon delivery. The inherent economy of single seat operation can be developed by automation. The key technological problems are caused by the lack of volume in a small fighter. In order to achieve automation of the required tasks, flight path control and sensor interfaces must be developed. Based upon emerging hardware and software technology, flight control and avionic subsystems can be optimized and integrated to achieve capability previously unavailable to small fighters. R.J.F.

THE DEVELOPMENT OF CRYOGENIC WIND TUNNELS AND THEIR APPLICATION TO MANEUVERING AIRCRAFT TECHNOLOGY

E. C. Polhamus and R. F. Boyden *In* AGARD Combat Aircraft Maneuverability Dec. 1981 12 p refs

Avail: NTIS HC A11/MF A01

The cryogenic wind tunnel and its potential for advancing maneuvering aircraft technology is discussed. A brief overview of the cryogenic wind tunnel concept and the capabilities and status of the Langley cryogenic facilities is given, as is a review of the considerations leading to the selection of the cryogenic concept such as capital and operating costs of the tunnel, model and balance construction implications, and test condition. Typical viscous, compressibility and aeroelastic effects encountered by maneuvering aircraft are illustrated and the unique ability of the cryogenic wind tunnels to isolate and investigate these parameters while simulating full scale conditions is discussed. The status of the Langley cryogenic wind tunnel facilities is reviewed and their operating envelopes described in relation to maneuvering aircraft research and development requirements. The status of cryogenic testing technology specifically related to aircraft maneuverability studies including force balances and buffet measurement techniques is discussed. Included are examples of research carried out in the Langley 0.3 meter transonic cryogenic wind tunnel to verify the various techniques. R.J.F.

THE 1983 NASA AUTHORIZATION, VOLUME 1

Washington GPO 1982 114 p Hearing before the Subcomm. on Transportation, Aviation and Mater. of the Comm. on Sci. and Technol., 97th Congr., 2nd Sess., No. 71, 17 Feb. 1982
(GPO-91-488-Vol-1) Avail: Subcommittee on Transportation, Aviation and Materials

The status of NASA systems technology programs which provide focused technology applications principally to civil aviation is addressed in light of the cost effectiveness of NASA's partnership with the aircraft industry and the economic impact of the reduction of NASA's roll in promoting advanced aeronautical technology. Progress made in research and technology programs encompassing aerodynamics, propulsion, materials and structures as well as controls and guidance, human factors, and low speed and high speed aircraft technology is reported. The six elements of the Aircraft Energy Efficiency program are highlighted. These are: engine component improvement, energy efficient engine, advanced turboprop, energy efficient transport, composite primary aircraft structures, and laminar flow control. The budget request for these programs is presented. N.W.

RESEARCH AND DEVELOPMENT AT MBB. TECHNICAL AND SCIENTIFIC PUBLICATIONS, 1981 [FORSCHUNG UND ETWICKLUNG. TECHNISCH-WISSENSCHAFTLICHE VEROEFFENTLICHUNGEN 1981]

1981 193 p refs Partly in ENGLISH and GERMAN
Avail: NTIS HC A09/MF A01

Research and development work carried out during 1981 at Messetschmitt-Bolkow-Blohm GmbH, Ottobrunn, FRG is presented. Aerodynamics, materials science, infrared imagery, aircraft and spacecraft design, and production engineering are discussed. Calculation methods, mathematical and scale models, and computer aided design are treated. Solar energy and high speed trains were investigated.

EXPERIENCE WITH HIGH PERFORMANCE V/STOL FIGHTER PROJECTS AT MBB

Felix Aulehla and Gerhard K. Kissel *In its* Res. and Develop. at MBB. Tech. and Sci. Publ., 1981 1981 16 p refs Presented at AIAA/NASA Ames V/STOL Conf., Palo Alto, Calif. 7-9 Dec. 1981
(MBB-FE-124/S/PUB/50) Avail: NTIS HC A09/MF A01

Experience gained with V/STOL aircraft having the capability to reach Mach 2 and to take off at after-burning temperatures is described. The German project VJ 101 C and the U.S./FRG project AVS as well as the joint U.S./FRG V/STOL Technology Program serve as examples. Guidance and control systems are depicted, including hover and transition control. Jet interference aspects, e.g., hot gas ingestion during take off with reheated jets are described. Author (ESA)

APPLICATION OF A STRUCTURAL OPTIMIZATION PROCEDURE FOR ADVANCED WINGS

Heinrich Goedel and Guenter Schneider *In its* Res. and Develop. at MBB. Tech. and Sci. Publ., 1981 1981 15 p refs Presented at 51st AGARD Meeting on Struct. and Mater. Panel, Aix-en-Provence, France, 14-19 Sep. 1981

(MBB-FE-171/S/PUB/49; AGARD-691) Avail: NTIS HC A09/MF A01

A finite element method optimization program was applied to: the sizing of a simplified metal wing for strength and flutter constraints; aeroelastic efficiency calculations for fin and rudder; and the structural layout of a carbon fiber composite delta wing. A flutter speed is calculated for the initial fully stressed design being 700 kt. After 5 iterations the desired flutter speed of 900 kt is reached with an increase < 3% total weight. Good correlation with more sophisticated analyses, e.g., NASTRAN is achieved. The aeroelastic deformation of a fin and rudder are calculated statisfactorily without iteration using the aerodynamic influence matrix produced by a separate program module. A 5% weight saving is achieved for the delta wing. Aileron aeroelastic efficiency is above specification for a supersonic roll. Author (ESA)

FLUID DYNAMICS OF JETS WITH APPLICATIONS TO V/STOL

Jan. 1982 433 p refs Proceedings of Symp. held at Lisbon, 2-5 Nov. 1981
(AGARD-CP-308; ISBN-92-835-0308-2) Avail: NTIS HC A19/MF A01

The fluid dynamics of vertical and short take-off and landing aircraft which employ thrust vectoring or lift augmentation were discussed. Jet interactions with neighboring surfaces, jet structure and development, wind tunnel simulation, injection and thrust augmentation, and theoretical models were considered.

N82-23151# Surrey Univ., Guildford (England). Dept. of Mechanical Engineering.

SOME ASPECTS OF JET DYNAMICS AND THEIR IMPLICATIONS FOR VTOL RESEARCH

L. J. S. Bradbury *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 26 p refs

Avail: NTIS HC A19/MF A01

Some of the problems associated with jet interference on VTOL aircraft are discussed. The jet interference that arises in hovering both in and out of ground effect is considered first and the factors that influence the entrainment that is responsible for the interference are discussed. In particular, it is shown that the flow in the initial region of a jet is strongly affected by circumferential variations in the jet nozzle flow angle and that this might account for some of the anomolous results for the decay of jets issuing from VTOL models. The possible use of Reichardt's method for studying the behavior of nonuniform jets is also discussed. The problem of jet interference in transition is next examined and the basis on which model tests are currently carried out is briefly reviewed. The dynamics of jet interference in transition are then considered in more detail and it is suggested that unlike interference in hovering, transition interference might well be accounted for on the basis of a potential flow model of the jet in a cross flow. Some experimental evidence in support of this notion is examined and a few examples of comparisons between predicted and experimental pressure distributions around a single jet issuing from a flat plate are given. AN EXPERIMENTAL AND THEORETICAL INVESTIGATION OF THE INTERACTION BETWEEN THE ENGINE JET AND THE SURROUNDING FLOW FIELD WITH REGARD TO THE PRESSURE DRAG ON AFTERBODIES

A. Zacharias *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 22 p refs

Avail: NTIS HC A19/MF A01

In order to clarify the interaction between rotationally symmetric engine jets and afterbody configurations, the dependence of the jet characteristics (i.e., the plume effect and the entrainment) and the afterbody pressure drag on the jet parameters, the free stream Mach number, and the afterbody geometry was analyzed. Extensive tests were carried out in the high subsonic Mach number range on three different afterbodies at Reynolds numbers from 500,000 to 1,300,000. The nozzle pressure ratio and the temperature ratio of the model jets were varied in the range (1.0) 1.2 to 2.4 and 1.0 to 2.86 respectively. Measurements were then carried out to determine the static pressure and temperature distribution as well as the boundary layer profiles over the surface of the models. At the same time, the pressure and temperature profiles in the jet were determined in several planes behind the jet exhaust plane. Empirical equations are presented which show the dependence of the plume effect, the entrainment, and the afterbody pressure drag on the jet parameters, the free stream Mach number, and the afterbody geometry. With the aid of a finite element method and theoretical potential flow model for jet simulation, a numerical procedure was developed which allows the pressure drag on rotationally symmetric afterbodies to be calculated with due allowance for the effects of the engine jets. Comparison of the theoretical and experimental results shows satisfactory agreement. J.D.

FLOWFIELD AND NOISE SOURCES OF JET IMPINGEMENT OF FLAPS AND GROUND SURFACE

Guenther Neuwerth *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 7 p refs

Avail: NTIS HC A19/MF A01

On the basis of experimental results it is shown that, in an undisturbed free jet of high subsonic speed as well as in a jet deflected by externally blown flaps (EBF), there are ordered turbulence structures. First, a feedback mechanism which develops at small distances between nozzle and stagnation point on the flaps and which amplifies the turbulence structures is explained. It is subsequently shown that the interaction of the jets and EBF generates a strong noise. Even without feedback both the undisturbed free jet and the jet deflected by EBF have the maximum levels in the noise spectrum at the Strouhal numbers of the natural ordered turbulence structures. JET V/STOL WIND-TUNNEL SIMULATION AND GROUND-PLANE EFFECTS

Richard J. Margason *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 21 p refs

Avail: NTIS HC A19/MF A01 CSCL 01A

The pretest preparation necessary to define the objectives of an appropriate investigation into the jet V/STOL wind tunnel simulation and ground plane effects were examined. Low speed wind tunnel testing of V/STOL aircraft concepts to determine the aerodynamic propulsion interaction effects during the transition between hover and wingborne flight is a necessary step in the development cycle of this type of aircraft. Powered models are normally used to determine the aerodynamic performance characteristics. Several factors which influence the selection of the model concept and the engine simulator are discussed. Some of the test techniques important for this class of aircraft model are examined. Wind tunnel wall effects important to this aircraft testing with special emphasis on groundplane effects are reviewed. E.A.K.

THE MODELING AND PREDICTION OF MULTIPLE JET VTOL AIRCRAFT FLOW FIELDS IN GROUND EFFECT

Donald R. Kotansky *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 20 p refs

(Contracts NAS2-9646; NAS2-10184; N62269-76-C-0086; N00014-79-C-0130)

Avail: NTIS HC A19/MF A01 CSCL 01A

An engineering methodology based on an empirical data base and analytical fluid dynamic models was developed for the prediction of propulsive lift system induced aerodynamic effects for multiple lift jet VTOL aircraft operating in the hover mode in and out of ground effect. The effects of aircraft geometry, aircraft orientation (pitch, roll) as well as height above ground are considered. Lift jet vector and splay directions fit the airframe, lift jet exit flow conditions, and both axisymmetric and rectangular nozzle exit geometry are also accommodated. The induced suckdown flows are computed from the potential flowfield induced by the turbulent entrainment of both the free jets and wall jets in ground effect and from the free jets alone out of ground effect. The methodology emphasized geometric considerations, computation of stagnation lines and fountain upwash inclination, fountain upwash formation and development, and fountain impingement on the airframe. E.A.K.

EVALUATION OF THE EFFECTS OF MODEL SCALE AND TEST TECHNIQUE ON JET-INDUCED EFFECTS

Stanley G. Kalemaris *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 11 p

Avail: NTIS HC A19/MF A01

The effects of model scale and test technique on the jet induced of a twin turbofan V/STOL aircraft were evaluated. The smallest mode was 2.1% as large as the full scale model. It is found that the two most important items to be modeled are fuselage shape and the coannular nature of a typical turbofan exhaust. Lift enhancing strakes are effective in enhancing the ground cushion and eliminating a possible source of scale effect. E.A.K.

JET EFFECTS ON FORCES AND MOMENTS OF A VSTOL FIGHTER TYPE AIRCRAFT

B. Haftmann *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 13 p refs

Avail: NTIS HC A19/MF A01

Results of jet effects on forces and moments of the VAK-191 B were compiled. The jet induced effects were investigated during the Vertical/Short Take-Off and Landing (VSTOL) mode in and out of ground effect, in yawed flight, during hover and transition right up to aerodynamic flight. The flight test results were compared with wind tunnel measurements performed during the VAK-191 B development phase and used for preparation of simulation and automatic flight control system development. Trends and deviations between aircraft and model test results are verified. The adequacy of wind tunnel data preparation are questioned. The practicability of wind tunnel data for the assessment of VSTOL aircraft design and determination of flight characteristics and performances are discussed. Recommendations for the measurements of jet induced forces and moments on VSTOL aircraft are outlined. E.A.K.

THRUST AUGMENTING EJECTORS: A REVIEW OF THE APPLICATION OF JET MECHANICS TO V/STOL AIRCRAFT PROPULSION

Brian Quinn *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 14 p refs

Avail: NTIS HC A19/MF A01

The fundamental role played by the fluid dynamics of jets within thrust augmenting ejectors that are designed as propulsive units for V/STOL aircraft were reviewed. Energy transfer efficiency and its impact on the production of thrust is discussed. It is explained why propellor like devices more effectively convert available energy to thrust and that overall ejector performance is very sensitive to losses sustained by individual components. The most important loss mechanism is incomplete mixing between the ejector's primary and entrained streams. An experimental data base that provides insight into interactions between turbulent mixing and other factors and improving mixing and ejector performance are reviewed. Free mixing and mixing in a confined environment are contrasted and it is concluded that the development of theoretical methods that successfully predict the performance of V/STOL ejectors must await the results of new experiments that measure turbulence intensities and Reynolds stresses in confined regions. E.A.K.

THEORETICAL OPTIMISATION AND EXPERIMENTAL VERIFICATION OF AN INJECTOR

A. Mignosi *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 12 p refs In FRENCH; ENGLISH summary

Avail: NTIS HC A19/MF A01

A modelization of induction systems, which could be used for thrust augmentation or more generally constitute a fluid drive system, is proposed for the steady regime case. A simple scheme in which a rapid mixing of the flows is assumed, allows to solve the basic equations and express the main parameters influence. Its verification is effected, using a set of experimental data obtained during the study of an induction driven wind-tunnel.

Gas turbine engines used in aviation: Design and construction of components /5th revised and enlarged edition/ --- Russian book
A82-30697
Chem-Braze abradable seal practical
A82-31048
Effect of operating life on the mechanical properties of the materials and load-bearing capacity of the rotor elements of gas-turbine engines
A82-31643
Maintenance in Service of High Temperature Parts
[AGARD-CP-317] N82-22172
Military maintenance policies and procedures for high-temperature parts. Will they be adequate?
N82-22173
Engine depot maintenance repair technology
N82-22174
Maintenance problems in gas turbine components at the Royal Naval Aircraft Yard, Fleetlands --- helicopter and marine gas turbines
N82-22175
Maintenance experience with civil aero engines
N82-22176
Engine component retirement for cause
N82-22177
Defects and their effect on the behavior of gas turbine discs
N82-22178
Repair and regeneration of turbine blades, vanes and discs
N82-22185
The contribution of thermal barrier coatings to improvements in the life and performance of gas turbine components
[PNR-90076] N82-22271
Advanced turbine study --- airfoil coling in rocket turbines
[NASA-CR-162003] N82-23249

ENGINE TESTS
New processes and methods of technical diagnostics and prognostics in the case of the engine NK-8-4. II
A82-29925

EPOXY MATRIX COMPOSITES
Effects of moisture on the mechanical properties of glass/epoxy composites
A82-29036

EQUATIONS OF MOTION
Computational aerodynamics - Its coming of age and its future
A82-29773
Planar equations of rollout motion for an aircraft with free or steerable landing gears
[NASA-TP-1984] N82-23244

ERROR ANALYSIS
The reliability of height and identity data --- secondary surveillance radar error analysis
A82-30312
Technical approaches for measurement of human errors
[NASA-CR-166314] N82-22249

ESCAPE SYSTEMS
Finite element analysis of through the canopy emergency crew escape from the T-38 aircraft
[AIAA 82-0705] A82-30096

EVACUATING (TRANSPORTATION)
Special investigation report: Evacuation of United Airlines DC-8-61, Sky Harbor International Airport, Phoenix, Arizona, December 29, 1980
[PB82-115619] N82-22236

EVALUATION
Experience with high performance V/STOL fighter projects at MBB
[MBB-FE-124/S/PUB/50] N82-23140

EXHAUST EMISSION
The effect of swirl burner aerodynamics on NOx formation
A82-28658

EXHAUST GASES
Calculation of the contributions of air traffic and road traffic to air pollution in the region of Schiphol airport in 1974
[NLR-TR-77100-U] N82-22808

EXHAUST NOZZLES
Energy efficient engine exhaust mixer model technology
[NASA-CR-165459] N82-22264

EXHAUST SYSTEMS
Energy efficient engine exhaust mixer model technology
[NASA-CR-165459] N82-22264
Turboprop and turbojet ejector optimisation
N82-23174
Computer modeling of fan-exit-splitter spacing effects on F100 response to distortion
[NASA-CR-167879] N82-23246

EXHAUST VELOCITY
Evaluation of the effects of model scale and test technique on jet-induced effects
N82-23167

EXTERNAL STORE SEPARATION
Design of dynamically-scaled, asymmetrical wind tunnel models
[NIAST-78/18] N82-22285

EXTERNAL STORES
Dynamic Environmental Qualification Techniques --- conference
[AGARD-CP-318] N82-22154
Development and use of dynamic qualification standards for Air Force stores
N82-22155
Qualification of equipment for gunfire induced vibration
N82-22158
Aircraft fuel tank slosh and vibration test
N82-22164
Approach in dynamic qualification of light helicopter stores and equipments
N82-22166
The dynamic qualification of equipment and external stores for use with rotary winged aircraft
N82-22167
Application of modal synthesis techniques for the dynamic qualification of wings with stores
N82-22168

EXTRAVEHICULAR ACTIVITY
Extravehicular Activity/Air Traffic Control (EVA/ATC) test report --- communication links to the astronaut
[NASA-CR-167600] N82-23381

F

F-4 AIRCRAFT
An electronic control for an electrohydraulic active control landing gear for the F-4 aircraft
[NASA-CR-3552] N82-22252

F-15 AIRCRAFT
F-15 fighter abilities evaluated
A82-29592
Pressure measurements on twin vertical tails in buffeting flow
[AIAA 82-0641] A82-30138
Development of vibration qualification test spectra for the F-15 aircraft
N82-22160
Analysis of rotary balance data for the F-15 airplane including the effect of conformal fuel tanks
[NASA-CR-3479] N82-22213
Integrated flight and fire control demonstration on an F-15B aircraft: System development and ground test results
N82-23185

F-16 AIRCRAFT
Dynamic qualification testing of F-16 equipment
N82-22159
Integration of avionics and advanced control technology
N82-22194

F-106 AIRCRAFT
The 1981 direct strike lightning data --- utilizing the F-106 aircraft [NASA-TM-83273] N82-22848
FABRICATION
Development of a homebuilt powered sailplane A82-29416
Development and demonstration of manufacturing processes for fabricating graphite/LARC 160 polyimide structural elements [NASA-CR-165809] N82-22315
FAIL-SAFE SYSTEMS
Damage tolerant design using collapse techniques [AIAA 82-0710] A82-30168
FAILURE ANALYSIS
Production Verification Testing (PVT) of guidance and control systems for high reliability N82-23187
FAILURE MODES
Defects and their effect on the behavior of gas turbine discs N82-22178
FAIRINGS
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft [NASA-CR-165841] N82-22316
FAN BLADES
Mechanical properties of a fiberglass prepreg system at cryogenic and other temperatures [AIAA 82-0708] A82-30099
Bird impact analysis package for turbine engine fan blades [AIAA 82-0696] A82-30162
FASTENERS
A multidimensional-crack-growth prediction methodology for flaws originating at fastener holes A82-28932
FATIGUE (MATERIALS)
Review of aeronautical fatigue investigations in the Netherlands, March 1979 - February 1981 [NLR-MP-81006-U] N82-22153
FATIGUE LIFE
On the characterization of damages in graphite-epoxy composites [AIAA 82-0757] A82-30117
Engine component retirement for cause N82-22177
Defects and their effect on the behavior of gas turbine discs N82-22178
Engineering property comparisons of 7050-T73651, 7010-T7651 and 7010-T73651 aluminum alloy plate --- for aircraft construction [NLR-MP-80047-U] N82-22360
FATIGUE TESTS
Production weldbonding on the A-10 aircraft A82-28995
Fatigue behavior of adhesively bonded joints A82-29032
A comparison of properties of single overlap tension joints prepared by ultrasonic welding and other means [AIAA 82-0661] A82-30091
FAULT TOLERANCE
Analysis of computing system configurations for highly integrated guidance and control systems N82-23189
FEEDBACK CONTROL
Active control of aeroelastic divergence [AIAA 82-0684] A82-30151
Feedback control of a cantilever wing in steady airflow [AIAA 82-0729] A82-30177
Multivariable closed loop control analysis and synthesis for complex flight systems N82-22193
FIBER COMPOSITES
Processing and uses of carbon fibre reinforced plastics --- Book A82-28643
Tailor-made structures; today, and tomorrow: New materials, an exploratory investigation into their potential use --- in aircraft [DAB-SDW-65/A/104/005] N82-22253
FIBER ORIENTATION
Damping and stiffness of aligned discontinuous fiber reinforced polymer composites [AIAA 82-0712] A82-30102
Shape optimization of fiber reinforced composites [AIAA 82-0719] A82-30169
FIBER REINFORCED COMPOSITES
Damping and stiffness of aligned discontinuous fiber reinforced polymer composites [AIAA 82-0712] A82-30102
Shape optimization of fiber reinforced composites [AIAA 82-0719] A82-30169
FIGHTER AIRCRAFT
Flight qualification of composite structures at AMD-BA [AIAA 82-0755] A82-30116
Aircraft fuel tank slosh and vibration test N82-22164
Combat Aircraft Manoeuvrability [AGARD-CP-319] N82-22187
A review of recent AGARD Symposia on the Angle of Maneuverability of Combat Aircraft N82-22188
Review of practical experience on combat aircraft maneuverability N82-22189
The military flying qualities specification, a help or a hindrance to good fighter design --- flight control systems N82-22190
Enhanced piloting control through cockpit facilities and A.C.T. N82-22195
The development of cryogenic wind tunnels and their application to maneuvering aircraft technology N82-22196
State of the art and recent perspectives on the study of the loss of control and spin N82-22197
Application of the theory of bifurcations to the study of the loss of control in combat aircraft N82-22198
Tail configurations for highly maneuverable combat aircraft N82-22201
Evaluation of aircraft in simulated combat: Computer against computer or computer against human pilot N82-22202
The assessment of aircraft combat effectiveness using a new computational method N82-22203
Evaluation of direct force mode fighters by combat simulation N82-22204
The study of combat aircraft maneuverability by air to air combat simulation N82-22205
Wind-tunnel investigation of the powered low-speed longitudinal aerodynamics of the Vectored-Engine-Over (VEO) wing fighter configuration [NASA-TM-83263] N82-22207
Multi-mission V/STOL with vectored thrust engines --- bombing, air superiority [PNR-90086] N82-22270
Experience with high performance V/STOL fighter projects at MBB [MBB-FE-124/S/PUB/50] N82-23140
Validation of zero-order feedback strategies for medium range air-to-air interception in a horizontal plane [NASA-TM-84237] N82-23237
FILLETS
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft [NASA-CR-165841] N82-22316
FILM COOLING
Advanced turbine study --- airfoil coling in rocket turbines [NASA-CR-162003] N82-23249

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

A82-29836 † The stability of monocoque panels under bending (Ustoichivost' panelei kessona pri izgibe). V. I. Shalashilin, O. B. Lozhkin, and V. A. Nagaev. *Aviatsionnaia Tekhnika,* no. 4, 1981, p. 60-65. In Russian.

An analysis is presented of the elastic stability of cylindrical monocoque panels under bending. The critical loading conditions are investigated, and the selection of parameter values for the discrete transverse reinforcement is considered. B.J.

A82-29837 † Application of a dimensionless criterion of transport efficiency in evaluating aircraft modifications (O primenenii bezrazmernogo kriteriia transportnoi effektivnosti v otsenkakh modifikatsii samoletov). V. N. Sheptunov. *Aviatsionnaia Tekhnika,* no. 4, 1981, p. 65-70. 6 refs. In Russian.

A dimensionless criterion of transport efficiency (defined as the ratio of aircraft performance to energy consumed in cruising flight) is proposed, and its possible applications are considered. The relationship between transport efficiency and cost efficiency is established, and a method is developed for estimating the cost efficiency of aircraft design solutions and modifications on the basis of the relationship between the dimensionless criterion and transport costs. A numerical example is discussed. B.J.

A82-29838 † Zone loading of flight-vehicle structures (Zonnoe nagruzhenie konstruktsii letatel'nykh apparatov). V. S. Azarin and B. L. Patsenker. *Aviatsionnaia Tekhnika,* no. 4, 1981, p. 71-73. 5 refs. In Russian.

A82-29841 † Analysis of shells of straight-wing type (K raschetu obolochek tipa priamogo kryla). S. N. Bulatov and P. N. Kurochka. *Aviatsionnaia Tekhnika,* no. 4, 1981, p. 80-83. In Russian.

Obraztsov's (1966, 1973) approach is used to develop a method for the analysis of variable-thickness shells of arbitrary cross section. The resolvent system is obtained by means of the Lagrange variational principle. The solutions are obtained in the form of expansions whose first terms correspond to the hypothesis of plane sections, while the other terms take into account displacements caused by warping. B.J.

A82-29844 † Thermal stability analysis for conical shells with variable parameters (Raschet termoprochnosti konicheskikh obolochek s peremennymi parametrami). V. R. Kotel'nikov. *Aviatsionnaia Tekhnika,* no. 4, 1981, p. 90-93. In Russian.

A method based on an approximate solution of an integral elasticity equation is proposed for analyzing, at an early design stage, thermoelastic stress-strain state of thin-walled conical shells with variable parameters. The proposed method is demonstrated in a case involving analysis of the effect of the wall thickness profile on the stress-strain state of a shell for specified temperature distributions. It is shown that thinning of the shell in the direction of the larger base results in increased stresses and shifting of the maximum stresses to the region of higher temperatures. It is therefore recommended that the wall increase in thickness toward the larger base. V.L.

A82-29845 † Determination of an optimal control program for an aircraft power plant during climb (Opredelenie optimal'noi programmy upravleniia silovoi ustanovkoi samoleta na uchastke razgona-nabora vysoty). O. K. Iugov. *Aviatsionnaia Tekhnika,* no. 4, 1981, p. 96-98. In Russian.

The paper examines the development of an optimal control program for an aircraft power plant during climb on the basis of a criterion of minimum fuel consumption. Theoretical results obtained using this approach are presented, and attention is given to the validity of the assumption of the constant flight weight of aircraft at subsonic and supersonic speeds in calculating longitudinal acceleration loading during climb. B.J.

A82-29871 # Sudden changes in wind velocity - Their effect on aircraft and means of reducing hazard. I (Uskok wiatru - Dzialanie na samolot, srodki zmniejszajace zagrozenie. I). J. M. Morawski and T. Smolicz (Instytut Lotnictwa, Warsaw, Poland). *Technika Lotnicza i Astronautyczna,* vol. 37, Apr. 1982, p. 5, 6. In Polish.

The effect of abrupt changes in wind velocity and direction on the trajectory and aerodynamic stability of aircraft are examined and possible counter measures, including flying techniques and the use of special devices, are suggested. Expressions are presented for calculating the downward drift angle and the effect of horizontal wind currents. V.L.

A82-29872 # Analysis of changes in the gas-dynamic parameters of a gas-turbine helicopter engine during acceleration (Analiza przebiegu parametrow gazodynamicznych i mocy turbinowego silnika smiglowcowego podczas przyspieszania). E. Jaworski. *Technika Lotnicza i Astronautyczna,* vol. 37, Apr. 1982, p. 13-17. In Polish.

Changes in the gas-dynamic parameters of a gas-turbine engine during acceleration are analyzed using the results of a mathematical model for the engine transients. The parameters examined include compressor and rotor rpm, compression ratio and air flow rate, margin of stability, turbine inlet temperature, excess air ratio, turbine pressure drop, and engine power. The effects of the working medium inertia and mass and heat accumulation on the transient processes in the engine are also discussed. V.L.

A82-29880 † Numerical study of vibrational relaxation in the turbulent mixing of jets in a supersonic nozzle (Chislennoe issledovanie kolebatel'noi relaksatsii pri turbulentnom smeshenii strui v sverkhzvukovom sople). A. V. Lavrov and V. A. Pospelov (Leningradskii Politekhnicheskii Institut, Leningrad, USSR). *Inzhenerno-Fizicheskii Zhurnal,* vol. 42, Apr. 1982, p. 586-592. 23 refs. In Russian.

The turbulent boundary layer equations are used to examine gasdynamic and physical processes in the nozzle and resonator of a CO2 gasdynamic laser with selective thermal excitation. In order to verify the adequacy of the proposed mathematical model of the laser, a comparison is made with experimental data for various values of stagnation temperature and pressure; good agreement between theoretical and experimental results is found. The effects of the composition of the secondary jet, and stagnation temperature and pressure on specific energy output are investigated. It is shown that, at high pressures and temperatures, sufficiently high specific outputs can be obtained only in the case of optimal CO2 concentration in the secondary jet. B.J.

A82-29923 Air Traffic Flow Management and Air Traffic Flow Control (Air Traffic Flow Management und Air Traffic Flow Control). R. Küttner (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt,* vol. 17, no. 4, 1981, p. 172-177. 7 refs. In German.

The growth in the volume of air traffic and the concentration of air traffic in certain areas and during certain time periods have caused operational difficulties for a number of area control centers (ACC) and approach control offices (APP) in the German Democratic Republic. These difficulties are related to an insufficient capacity of ACC and APP to cope with peak traffic demands, because, in connection with economic considerations, it is often not possible to design installations for peak demands. Two approaches are used to reduce the considered difficulties as much as possible. The approach of Air Traffic Flow Management (ATFM) involves the assignment of a certain flight to a specific time slot. There are generally no delays, if the resulting requirements are met. The approach of Air Traffic Flow Control is only employed if the ATFM process is unsuitable. Air Traffic Flow Control specifies the number of aircraft which can enter per unit of time. G.R.

A82-29924 Flight simulators (Flugsimulatoren). G. Westphal (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt,* vol. 17, no. 4, 1981, p. 180-189. 5 refs. In German.

Simulation involves the employment of models. A 'model' is a material or a conceptual system which corresponds to the object to be simulated on the basis of certain analogies. Flight simulators are concerned with the simulation of conditions and events occurring during the flight of an aircraft. With respect to their employment, the simulators can be divided into devices for research and for training. Research simulators make it possible to achieve an optimum design for the man-machine system in the cockpit of modern aircraft. The reasons for the employment of flight simulators in the training programs for the pilots of airlines are discussed, taking into account also the various subsystems used in the simulator. Particular attention is given to the cockpit, the computer, and the system providing a simulation of the visual scene. G.R.

A82-29925 **New processes and methods of technical diagnostics and prognostics in the case of the engine NK-8-4. II (Neue Verfahren und Methoden der technischen Diagnostik und Prognostik beim Triebwerk NK-8-4. II).** S. Jung (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt,* vol. 17, no. 4, 1981, p. 193-195. In German.

A82-30004 **Composite bonds improve thermal integrity.** A. Kleider (U.S. Army, Avionics Laboratory, Fort Monmouth, NJ), J. T. Johnson (Westinghouse Defense and Electronic Systems Center, Baltimore, MD), and R. L. Kolek (Westinghouse Electric Corp., Marine Div., Sunnyvale, CA). *ManTech Journal,* vol. 6, no. 3, 1981, p. 37-41. Army-supported research.

Production process considerations which, once solved, permitted fabrication of 1000 parts/yr of stabilized line-of-sight gimbals for aircraft electrooptical systems and sensors are discussed. A thermal sample was fabricated of composites to evaluate the expansion characteristics for mating bearings to the bore with resultant constant friction and stiffness values over the operating temperature range. Titanium rings were chosen to interface with the outer bearing race, and a series of thermal cycles were performed in order to test the bonds. Procedures of a design change and implementation are outlined, noting the final design called for 121 parts, some formed with expandable internal mandrels. Curing conditions for the fiber composite structures are detailed, including formation of the base plate stiffener ring. The gimbal produced features a 33% weight savings over previous gimbals. M.S.K.

A82-30076 **Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1 - Structures and materials. Part 2 - Structural dynamics and design engineering.** Conference sponsored by AIAA, ASME, ASCE, and AHS. New York, American Institute of Aeronautics and Astronautics, 1982. Pt. 1, 532 p.; pt. 2, 646 p. Price of two parts, members, $100.; nonmembers, $125.

An integration scheme to determine the dynamic response of a launch vehicle with several payloads is considered along with aeroelastic characteristics of the Space Shuttle external tank cable trays, the structural design of integral tankage for advanced space transportation systems, and optimum damping locations for structural vibration control. Attention is given to a damage induced aeroelastic failure mode involving combination and parametric resonant instabilities of lifting surfaces, passive damping mechanisms in large space structures, an automated technique for improving modal test/analysis correlation, pressure measurements on twin vertical tails in buffeting flow, and a wind-tunnel study of the aerodynamic characteristics of a slotted versus smooth-skin supercritical wing. Other topics explored are related to the active control of aeroelastic divergence, stress constraints in optimality criteria design, and damage tolerant design using collapse techniques. G.R.

A82-30087 * # **Effects of 50,000 hours of thermal aging on graphite/epoxy and graphite/polyimide composites.** J. R. Kerr and J. F. Haskins (General Dynamics Corp., Convair Div., San Diego, CA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 101-108. Contract No. NAS1-12308. (AIAA 82-0657)

Thermal effects on tensile strengths of advanced composite systems have been determined for exposure times of 100 to 50,000 hours (5.7 years). Exposures were conducted at both ambient and reduced pressures at two temperatures for each composite. At the completion of the various aging periods, specimens were removed from the specially constructed aging furnaces, visually examined, and tensile tested at elevated temperature. After tensile testing, many of the thermal aging specimens were examined using a scanning electron microscope. Results of these studies are presented, and the changes in properties and the degradation mechanisms during high-temperature aging are discussed and illustrated using metallographic techniques. (Author)

A82-30091 # **A comparison of properties of single overlap tension joints prepared by ultrasonic welding and other means.** T. Renshaw, K. Wongwiwat, and A. Serrantonio (Fairchild Republic Co., Farmingdale, NY). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 137-144. (AIAA 82-0661)

An employment of the ultrasonic welding process in aircraft assembly operations might possibly lead to an achievement of very significant cost and weight reductions. A development program has been in progress with the objective to realize the potentials of the ultrasonic welding process for aircraft production. The present investigation represents an extension of studies reported by Renshaw and Serrantonio (1980). It had been found that large, single overlap joints made with ultrasonic spotwelds could be loaded to sheet stresses above the yield strength. Tests conducted in the current investigation cover series of interlayer situations which can exist in the assembly of aircraft. Fatigue data are also reported for the joints. Other types of joints than ultrasonically welded ones were also prepared and tested in order to develop directly comparable static and fatigue properties. Weight and cost comparisons are included. G.R.

A82-30096 # **Finite element analysis of through the canopy emergency crew escape from the T-38 aircraft.** R. E. McCarty and R. A. Smith (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 197-205. 15 refs. (AIAA 82-0705)

The nonlinear static response to a concentrated load on the inner surface of the student pilot canopy for the T-38 aircraft has been predicted using the MAGNA (Materially and Geometrically Nonlinear Analysis) finite element computer program. The analyses conducted were intended to simulate the impingement on the canopy inner surface of a breaker located on the student pilot ejection seat. Criteria for defining fracture of the canopy were selected and work required to fracture the canopy was then determined from computed nonlinear load-displacement curves. The static load and work required to fracture two proposed bird-resistant designs for the T-38 student canopy were compared to those required to fracture the current design. It is concluded that transparency penetration for emergency crew escape via ejection seat breaker impingement on the T-38 student canopy is probably not feasible for a 0.68 in. thick monolithic stretched acrylic bird-resistant design. The same mode of transparency penetration might prove feasible for a 0.40 in. thick monolithic polycarbonate bird resistant design. (Author)

A82-30099 * # **Mechanical properties of a fiberglass prepreg system at cryogenic and other temperatures.** P. J. Klich and C. E. Cockrell (NASA, Langley Research Center, Systems Engineering Div., Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 223-230. 9 refs. (AIAA 82-0708)

The compressor driving the flow in the National Transonic Facility, which is nearing completion at the Langley Research Center, has 25 fiberglass blades. E-glass cloth with a pre-impregnated epoxy resin has been selected as the material for the fan blades because of its low cost, high damping, and fatigue resistance. A complete characterization is presented of this fan blade fiberglass system at temperatures of 367 K, room temperature, and 89 K. The characterization test results suggest that the material follows the general trends of metals and other glass-reinforced plastics at cryogenic temperatures. A slight diminution in strength was observed at the elevated temperature. The tests included the following: tensile, compression, fatigue, inplane shear, interlaminar shear, thermal expansion, creep, and thermal cycle. C.R.

A82-30102 # **Damping and stiffness of aligned discontinuous fiber reinforced polymer composites.** R. F. Gibson, C. T. Sun, and S. K. Chaturvedi (Florida, University, Gainesville, FL). In:

Aerospatiales, Paris (France).

APPLICATION OF THE THEORY OF BIFURCATIONS TO THE STUDY OF THE LOSS OF CONTROL IN COMBAT AIRCRAFT [APPLICATION DE LA THEORIE DS BIFURCATIONS A L'ETUDE DES PERTES DE CONTROLE SUR AVION DE COMBAT]

Phillipe Guichetsau *In* AGARD Combat Aircraft Maneuverability Dec. 1981 13 p refs In FRENCH

Avail: NTIS HC A11/MF A01

Aircraft motion can be described in a rigorous manner by a nonlinear differential system, depending on parameters, joining variables of state (incidence, side-slip, speed ...) and variable control (positioning of rudders) by means of equations of flight mechanics and an aerodynamic model. The proposed method consists of determining the stability limits of the system, and of predicting the evolution of that which becomes unstable. It is based on the theory of bifurcation of nonlinear differential systems. A.R.H.

PREDICTIONS OF AERODYNAMIC CHARACTERISTICS OF HIGHLY MANEUVERABLE CONFIGURATIONS

W. B. Brooks and T. D. Beatty *In* AGARD Combat Aircraft Maneuverability Dec. 1981 6 p refs

Avail: NTIS HC A11/MF A01

The ability of a variety of currently available methods to predict the lateral/directional characteristics of arbitrary configurations is discussed. The programs surveyed generally had either nonlinear or arbitrary body capability, but not both. Published comparisons between the hypersonic arbitrary body program and experimental data suggested a direct extension of the commonly used Allen-Jorgenson cross flow analogy to arbitrary bodies. Though useful, this extension of the Allen-Jorgenson method did not include dynamic pressure losses on aft lifting surfaces. An examination of a nonlinear approach which computes the forces on a combined body/separated region contour and corrects these forces by an empirical momentum deficit in the separated region was begun. For axisymmetric bodies the method reduces to the standard Allen-Jorgenson cross flow approach. Two potentially major advantages over the Allen-Jorgenson method are that the method does provide a model for predicting body fin interaction and that the method is extendable to arbitrary bodies. R.J.F.

AEROELASTIC TAILORING FOR CONTROL AND PERFORMANCE: ARE REQUIREMENTS COMPATIBLE?

D. Booker *In* AGARD Combat Aircraft Maneuverability Dec. 1981 4 p refs

Avail: NTIS HC A11/MF A01

The variations of camber and twist along a wing required for optimum performance in low 'g' (cruise) and high 'g' (combat) flight are discussed. It is shown that a wing with active leading edge and trailing edge maneuverer devices scheduled with angle of attack, and structurally tailored to control aeroelastic bending and torsion, can approach optimum performance. However the torsional stiffness of such a wing may be too low for satisfactory roll control at high airspeeds in supersonic flight. Some compromise to performance is implied if torsional stiffness has to be increased to provide adequate control capability. Author

TAIL CONFIGURATIONS FOR HIGHLY MANEUVERABLE COMBAT AIRCRAFT

W. E. Fellers, W. S. Bowman, and P. T. Wooler *In* AGARD Combat Aircraft Maneuverability Dec. 1981 18 p

Avail: NTIS HC A11/MF A01

The drag due to lift, maximum lift, and stability and control characteristics of tailless, canard, and aft tail configurations of highly maneuverable combat aircraft, using both aerodynamic surfaces and vectored thrust for pitch control are evaluated. The same low aspect ratio wing planform was used on all the configurations. Control configured vehicle concepts were employed. Variable wing camber employing leading edge and trailing edge flaps was used to reduce profile drag. The center of gravity was located as far aft as allowed by the stability and control criteria, in order to reduce subsonic and supersonic trim drag. The critical pitch control criterion was found to be the providing of adequate nose down pitch acceleration in the angle of attack region near maximum lift. The aft center of gravity limits for both tailless and canard configurations without pitch thrust vectoring were required to be forward of the optimum location for minimum subsonic maneuver trim drag. The aft tail configuration was not limited in this manner. In addition it could attain a higher subsonic maximum lift. It also had a greater design flexibility since the aft center of gravity limit could be influenced by the tail area. For these reasons it was the preferred configuration. B.W.

EVALUATION OF AIRCRAFT IN SIMULATED COMBAT: COMPUTER AGAINST COMPUTER OR COMPUTER AGAINST HUMAN PILOT [EVALUATION D'AVIONS EN COMBAT SIMULE CALCULATEUR CONTRE CALCULATEUR OU CALCULATEUR CONTRE PILOTE HUMAIN]

J. Pedotti and Y. Hignard (Centre Electronique de l'Armement) *In* AGARD Combat Aircraft Maneuverability Dec. 1981 14 p refs In FRENCH

Avail: NTIS HC A11/MF A01

A program was developed for simulating one aircraft in combat with another. The adaptive logic of aerial maneuvers (LAMA) program was validated by theoretical studies and by pilot/model tests on the CELAR simulator. The program permits either an entirely numerical model or a simulation of interactive hostility against a pilot on a simulator. Not only does the program provide a means for studying new weapons systems, it also provides a hostile performer for training pilots. A.R.H.

THE ASSESSMENT OF AIRCRAFT COMBAT EFFECTIVENESS USING A NEW COMPUTATIONAL METHOD

Michael Falco and Gilbert Carpenter *In* AGARD Combat Aircraft Maneuverability Dec. 1981 11 p refs Sponsored in part by Army Aviation Research and Development Command

Avail: NTIS HC A11/MF A01

A computational method for the assessment of aircraft combat effectiveness in the design concept phase is discussed. The approach employs a stochastic learning method, in conjunction with dynamic simulation, to derive aircraft maneuver strategies in the form of a feedback control based upon a discretized set of threat visual or warning system cues. The derived strategies maximize either survival probability of kill probability in the one on one setting. Computational results are presented for selected aircraft designs in missile and gun combat. B.W.

EVALUATION OF DIRECT FORCE MODE FIGHTERS BY COMBAT SIMULATION

C. H. Guthrie *In* AGARD Combat Aircraft Maneuverability Dec. 1981 13 p

Avail: NTIS HC A11/MF A01

Advanced fighter concepts which have been significantly influenced by air combat simulation are discussed. Both man in the loop and digital combat simulation are excellent tools for developing and screening advanced fighter concepts. One important application is the evaluation of fighters with high authority aerodynamic and propulsive controls. Manned and digital air combat simulations showed that high authority controls substantially increase combat effectiveness when used both for enhance large scale maneuverability and for automatic pointing of the fuselage. Digital simulation showed that fighters with high authority direct force modes require lower sustained load factors than conventional designs for a constant level of effectiveness in close in combat. Therefore, fighters with direct force modes can be lighter and less expensive than conventional aircraft. In a manned simulation of close in combat, single fighters with several levels of aerodynamic and propulsion control authority were flown against two threat fighters of equal instantaneous sustained turn rate capability and with identical avionics and armament. For the fighter configured with the highest authority controls, many measures of engagement control and effectiveness were double those of the conventional (baseline) fighter. B.W.

THE STUDY OF COMBAT AIRCRAFT MANEUVERABILITY BY AIR TO AIR COMBAT SIMULATION
A. G. Barnes *In* AGARD Combat Aircraft Maneuverability Dec. 1981 9 p
Avail: NTIS HC A11/MF A01

Air to air combat by ground based simulation and its contribution to the design, development and operational use of combat aircraft is evaluated. The merits of different aircraft/missile combinations can be assessed under controlled conditions with pilot involvement. Parameters which influence maneuverability, such as sustained turn rate, attained turn rate, and SEP can be easily varied, and translated into combat success. The relative importance of these parameters are discussed in the light of experimental results. B.W.

AERODYNAMIC PERFORMANCE OF SLENDER WINGS WITH SEPARATED FLOWS Technical Report, period ending 31 Dec. 1981
C. Subba Reddy Mar. 1982 64 p refs
(Grant NsG-1561)
(NASA-CR-168768; NAS 1.26:168768) Avail: NTIS HC A04/MF A01 CSCL 01A

The aerodynamic performance of low aspect ratio sweptback wings with vortex flows was numerically investigated using the free vortex sheet method. The models studied included flat, cambered, strake, and leading edge flapped wings of different planforms. The theoretical results predicted by the method were compared with the existing experimental data wherever available; and the code capabilities and limitations were explored. Also the effects of the wing thickness, fuselage, leading edge flap and multiple vortex modeling on the aerodynamic characteristics were studied. Author

WIND-TUNNEL INVESTIGATION OF THE POWERED LOW-SPEED LONGITUDINAL AERODYNAMICS OF THE VECTORED-ENGINE-OVER (VEO) WING FIGHTER CONFIGURATION
John W. Paulson, Perry D. Whitten (General Dynamics Corp., Fort Worth, Tex.), and Stephen C. Stumpfl (AFWAL) Mar. 1982 274 p refs
(NASA-TM-83263; NAS 1.15:83263) Avail: NTIS HC A12/MF A01 CSCL 01A

A wind-tunnel investigation incorporating both static and wind-on testing was conducted in the Langley 4- by 7-Meter Tunnel to determine the effects of vectored thrust along with spanwise blowing on the low-speed aerodynamics of an advanced fighter configuration. Data were obtained over a large range of thrust coefficients corresponding to takeoff and landing thrust settings for many nozzle configurations. The complete set of static thrust data and the complete set of longitudinal aerodynamic data obtained in the investigation are presented. These data are intended for reference purposes and, therefore, are presented without analysis or comment. The analysis of the thrust-induced effects found in the investigation are not discussed. INVESTIGATION OF PASSIVE SHOCK WAVE-BOUNDARY LAYER CONTROL FOR TRANSONIC AIRFOIL DRAG REDUCTION Final Report, 1 Oct. 1979 - 30 Sep. 1981
H. T. Nagamatsu, W. B. Brower, Jr., L. Bahi, and J. Ross Apr. 1982 204 p refs
(Grant NsG-1624)
(NASA-CR-168844; NAS 1.26:168844) Avail: NTIS HC A10/MF A01 CSCL 01A

The passive drag control concept, consisting of a porous surface with a cavity beneath it, was investigated with a 12-percent-thick circular arc and a 14-percent-thick supercritical airfoil mounted on the test section bottom wall. The porous surface was positioned in the shock wave/boundary layer interaction region. The flow circulating through the porous surface, from the downstream to the upstream of the terminating shock wave location, produced a lambda shock wave system and a pressure decrease in the downstream region minimizing the flow separation. The wake impact pressure data show an appreciably drag reduction with the porous surface at transonic speeds. To determine the optimum size of porosity and cavity, tunnel tests were conducted with different airfoil porosities, cavities and flow Mach numbers. A higher drag reduction was obtained by the 2.5 percent porosity and the 1/4-inch deep cavity. T.M.

AERODYNAMIC ANALYSIS OF VTOL INLETS AND DEFINITION OF A SHORT, BLOWING-LIP INLET Final Report
J. Syberg and A. L. Jones Apr. 1982 81 p refs
(Contract NAS3-22389)
(NASA-CR-165617; NAS 1.26:165617; D6-51418) Avail: NTIS HC A04/MF A01 CSCL 01A

The results indicated that, without boundary layer control, either a very long inlet or an inlet with a very high contraction ratio lip will be required to meet the stringent design requirements. It is shown that active boundary layer control is an effective means of preventing separation and that a significant reduction in inlet size can be achieved by removing only a small amount of bleed in the throat region of the inlet. A short, blowing-lip model was designed and fabricated. This model features an adjustable, blowing slot located near the hilite on the windward side of the inlet. T.M.

AERODYNAMIC CHARACTERISTICS OF THE EXTERNAL USB POWERED LIFT SYSTEM USING SIDE FENCES FOR ENHANCEMENT OF COANDA FLOW ATTACHMENT
Masataka Maita, Hirotoshi Fujieda, and Shigemi Shindo Oct. 1981 20 p refs
(NAL-TR-686T; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

The fundamental aspects concerning the effect of side fences on powered lift augmentation for the external upper surface blowing (USB) propulsive-lift configuration, as ascertained by wind tunnel experiment, are presented. From the comparisons of aerodynamic performances made of configurations using side fences and of those using either vortex generators or using no special devices, it is concluded that the USB propulsive-lift concept using side fences for enhancement of engine exhaust flow attachment has promising potential for attaining very high and efficient powered lift performances. M.G.

N82-22213*# Bihrle Applied Research, Inc., Jericho, N. Y.
ANALYSIS OF ROTARY BALANCE DATA FOR THE F-15 AIRPLANE INCLUDING THE EFFECT OF CONFORMAL FUEL TANKS
Billy Barnhart Washington NASA Apr. 1982 71 p refs
(Contract NAS1-16205)
(NASA-CR-3479; NAS 1.26:3479) Avail: NTIS HC A04/MF A01 CSCL 01A

F-15 rotary balance data was analyzed, and the influence of control deflections, Reynolds number and airplane components, i.e., body, wing, horizontal and vertical tails, as well as conformal tanks, on the aerodynamics up to 90 degrees angle of attack are discussed. Steady state spin mode predictions using these data are presented, which show excellent correlation with spin tunnel and flight test results. Generally, the data shows damped yawing moment slopes with rotation at all angles of attack, and good control effectiveness. Differences in the rotary aerodynamics due to the addition of conformal tanks are minimal. The small differences in the region of the flat spin do, however, indicate that the resulting spin mode would be slightly flatter and faster for a conformal tank equipped airplane. The addition of conformal tanks make the airplane more departure susceptible. S.L.

EFFECT OF NACELLES ON AERODYNAMIC CHARACTERISTICS OF AN EXECUTIVE-JET MODEL WITH SIMULATED, PARTIAL-CHORD, LAMINAR-FLOW-CONTROL WING GLOVE
Richard L. Campbell Apr. 1982 104 p refs
(NASA-TM-83271; L-14982; NAS 1.15:83271) Avail: NTIS HC A06/MF A01 CSCL 01A

Tests were conducted in the Langley High-Speed 7- by 10-Foot Tunnel using a 1/10-scale model of an executive jet to examine the effects of the nacelles on the wing pressures and model longitudinal aerodynamic characteristics. For the present investigation, each wing panel was modified with a

Various parameters (are ratio between injected and driven flows, Mach number, pressure and temperature ratios) are studied. The injector configuration also appears to be very important, in particular as to pressure fluctuations produced at injection and the corresponding aerodynamic noise in the wind tunnel. Author

UNSTEADY EJECTORS
Herman Viets *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 12 p refs

(Grant AF-AFOSR-0025-81)
Avail: NTIS HC A19/MF A01

Ejectors are examined by introducing a time dependency into the flow to increase the mixing rate and hence improve the performance of very short devices. Past studies of unsteady flows related to ejectors are reviewed and a device is proposed which has the potential to increase the mixing by means of both an unsteady flow and also acoustic interaction between the frequencies generated by the jet and the ejector shroud. Standing acoustic waves are identified in the ejector and, it is found that the short unsteady ejector performance is superior to that of a slot jet geometry. E.A.K.

IMPROVEMENT OF EJECTOR THRUST AUGMENTATION BY PULSATING OR FLAPPING JETS
G. Binder and H. Didelle *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 11 p refs Sponsored in part by Minstere de la Defense

Avail: NTIS HC A19/MF A01

The influence of pulsating or flapping motions forced on the primary jet on the performance of thrust augmenting ejectors was investigated. The effect of the frequency and the amplitude of the forced perturbations was determined for various mixing duct lengths and diffusor geometries. In constant area ejectors the improvement in thrust augmentation ratio over the performance obtained with a steady jet in the same geometry increases with decreasing duct length. Thrust augmentation further improved by the gain in diffusor pressure recovery produced by the unsteady jets. Maximum augmentations of 1.9 and 1.65 were obtained with pulsating and flapping jets respectively as compared to 1.35 and 1.5 in the steady case. These improvements in ejector performance are mainly due to the faster mixing produced by these jets. E.A.K.

EXPERIMENTAL STUDY OF A JET DEFLECTOR [ETUDE EXPERIMENTALE D'UN DEVIATEUR DE JET]
M. Lepretre and C. Portier *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 20 p refs In FRENCH; ENGLISH summary Sponsored in part by Delegation Generale pour l'Armement
Avail: NTIS HC A19/MF A01

A provisional model of an aerodynamic device for orienting the thrust vector of a jet engine was set up by exploiting the reattachment properties of a sonic or slightly supersonic jet on a flat or curved deflector conveniently positioned downwards from the nozzle outlet. A parametric study shows that it would be possible to obtain important reverse rates without a drastic loss of the resultant thrust. Such a device can be of benefit in improving controllability during combat or in designing a STOL. The arrangement defined is characterized by great simplicity, the jet reattachment is spontaneous over all the explored area, and no extra systems are required for blowing or suction.

TURBOPROP AND TURBOJET EJECTOR OPTIMISATION

V. P. Riviello, A. Murolo, and G. Torella (Italian Air Force Academy) *In* AGARD Fluid Dyn. of Jets with Appl. to V/STOL Jan. 1982 13 p refs
Avail: NTIS HC A19/MF A01

The off design performance of turboprop and turbojet engine with ejector exhaust ducts was investigated during the AR 318 turboprop engine development and certification program. The optimization of the matching between angle and exhaust duct system is developed. A theoretical approach is used by a synthesis program the appropriate numerical simulation of the ejector, both in the case of subsonic condition at the engine exhaust station and in a sonic station, with supersonic development of the flow through the ejector. To study the supersonic flow through the ejector a set of available experimental results is examinated to evaluate the reliability of theoretical methods for the secondary flow and for conditions. Hot condition experimental tests were performed and was compared with theoretical calculations. The next step concerns the installation of a suitable ejector system on the AR 180.10 turbojet engine, which is a derived version of the AR 318 turboprop. E.A.K.

INTEGRATED NAVIGATION-TF/TA-SYSTEM BASED ON STORED TERRAIN DATA PROCESSING
Horst-Dieter Lerche *In* AGARD Guidance and Control Technol. for Highly Integrated Systems Feb. 1982 13 p

Avail: NTIS HC A09/MF A01

A method to improve the reliability and optimization of terrain following flight is discussed. The terrain parameter comparison (TERPAC) system is described in which the main source of information is a terrain data base aboard the aircraft. The comparison is done in the position-fix-mode by matching the measured terrain signatures against terrain reference signatures stored in the mass memory. A hardware and software design of the combined navigation and terrain following/avoidance flight control system was developed and adapted to a modem avionic system architecture. M.G.

OPTIMAL INERTIAL NAVIGATION USING TERRAIN CORRELATION: AN ATTRACTIVE SOLUTION TO THE GROUND ATTACK AIRCRAFT NAVIGATION PROBLEM

L. Camberlein, M. deCremiers, and D. Chermette *In* AGARD Guidance and Control Technol. for Highly Integrated Systems Feb. 1982 15 p In FRENCH; ENGLISH summary

Avail: NTIS HC A09/MF A01

The use of terrain correlation for all-weather penetration and ground attack aircraft is discussed. Positioning by terrain correlation is briefly reviewed. For the ground attack aircraft application special algorithms allow large heading freedom over the updating area. The parameter sensitivity of the updating accuracy is analysed. This includes the terrain characteristics, the cartography accuracy, and the altitude measurement accuracy. The main operational features for ground attack aircraft are summarized: tri-dimensional updating; high accuracy facilitated by low altitude flight; self-contained, secure, jam-resistant, automated operation; a low level of heading constraint to and over the updating area; savings in weight, volume, electrical power and cost using sensors already needed on the aircraft. The principle of inertial system optimal updating is also briefly discussed. Temporal carryover from position and velocity updates can be crucial for accurate horizontal terrain following and weapon delivery initialization and in-flight alignment of tactical missiles. The possibility of integrating correlation and optimal filtering in the inertial unit is shown. A typical all weather ground attack mission scenario is described. This includes the extensive mission preparation, the nominal flight plan and possible alternatives, update area selection using ground based equipment and map data bases, and the data assembly and cassette loading. A possible operational systems architecture is described with the necessary equipment. M.G.

INTEGRATED FLIGHT AND FIRE CONTROL DEMONSTRATION ON AN F-15B AIRCRAFT: SYSTEM DEVELOPMENT AND GROUND TEST RESULTS
R. J. Landy, C. A. Scolatti, and J. F. Hunter (AFWAL) *In* AGARD Guidance and Control Technol. for Highly Integrated Systems Feb. 1982 17 p refs

Avail: NTIS HC A09/MF A01

An integrated flight and fire control (IFFC) system is described which utilizes an automatic coupler and modified flight control system to steer out tracking errors calculated by a director fire control system using information from an ATLIS 2 electro-optical tracker. The F-15B aircraft is the test bed aircraft. Simulation and analysis results indicate that the IFFC system has excellent air-to-air gunnery accuracy with decreased pilot workload. These results also indicate that attacker survivability in air-to-ground gunnery and bombing encounters can be increased by using maneuvering approaches without compromising air-to-ground weapon delivery accuracy. Extensive ground testing of IFFC hardware and software is described. Details of the flight test program plan are presented. M.G.

PRODUCTION VERIFICATION TESTING (PVT) OF GUIDANCE AND CONTROL SYSTEMS FOR HIGH RELIABILITY

Paul J. Logus *In* AGARD Guidance and Control Technol. for Highly Integrated Systems Feb. 1982 11 p refs

Avail: NTIS HC A09/MF A01

The testing of equipment for highly integrated guidance and control systems is addressed. A departure to the usual acceptance testing is discussed by examining in some detail a technique called production verification testing (PVT). Some of the recent literature and experience is reviewed. Computer simulation are used to examine various facets of PVT. Particular emphasis is directed toward the implementation of 100% testing of all systems prior to delivery through the use of N sequential failure-free cycles. Finally, conclusions drawn from computer simulations are presented. The number of N sequential failure free cycles that may be necessary is suggested, providing insight into interpreting the results. Simulation results suggest a means for determining not only expected operational reliability but also process control problems during manufacturing. R.J.F.

A FLIGHT INVESTIGATION OF BLADE-SECTION AERODYNAMICS FOR A HELICOPTER MAIN ROTOR HAVING RC-SC2 AIRFOIL SECTIONS
Charles E. K. Morris, Jr. Mar. 1982 163 p refs
(NASA-TM-83298; NAS 1.15:83298) Avail: NTIS HC A08/MF A01 CSCL 10A

Pressure data at 90 percent blade radius for a helicopter main rotor with RC-SC2 blade sections was obtained. Concurrent measurements were made of vehicle flight state, performance and some rotor loads. The test envelope included hover, level flight from about 65 to 144 knots, climb and descent, and collective fixed maneuvers. Airfoil pressure distributions obtained in flight agree with those theoretical calculations for two dimensional, steady flow. S.L.

APPLICATION OF A TRANSONIC POTENTIAL FLOW CODE TO THE STATIC AEROELASTIC ANALYSIS OF THREE-DIMENSIONAL WINGS
Woodrow Whitlow, Jr. and Robert M. Bennett Apr. 1982 12 p refs Presented at the AIAA/ASME/ASCE/AHS 23rd Struct., Structural Dyn. and Mater. Conf., New Orleans, 10-12 May 1982
(NASA-TM-83296; NAS 1.15:83296; AIAA-PAPER-82-0689) Avail: NTIS HC A02/MF A01 CSCL 01A

Since the aerodynamic theory is nonlinear, the method requires the coupling of two iterative processes - an aerodynamic analysis and a structural analysis. A full potential analysis code, FLO22, is combined with a linear structural analysis to yield aerodynamic load distributions on and deflections of elastic wings. This method was used to analyze an aeroelastically-scaled wind tunnel model of a proposed executive-jet transport wing and an aeroelastic research wing. The results are compared with the corresponding rigid-wing analyses, and some effects of elasticity on the aerodynamic loading are noted. T.M.

AN ACCURATE METHOD FOR EVALUATING THE KERNEL OF THE INTEGRAL EQUATION RELATING LIFT TO DOWNWASH IN UNSTEADY POTENTIAL FLOW
Robert N. Desmarais Apr. 1982 15 p refs Presented at the AIAA/ASME/ASCE/AHS 23rd Struct., Structural Dyn. and Mater. Conf., New Orleans, 10-12 May 1982 10-12 May 1982
(NASA-TM-83281; NAS 1.15:83281; AIAA-PAPER-82-687) Avail: NTIS HC A02/MF A01 CSCL 01A

The method is capable of generating approximations of arbitrary accuracy. It is based on approximating the algebraic part of the nonelementary integrals in the kernel by exponential functions and then integrating termwise. The exponent spacing in the approximation is a geometric sequence. The coefficients and exponent multiplier of the exponential approximation are computed by least squares so the method is completely automated. Exponential approximates generated in this manner are two orders of magnitude more accurate than the exponential approximation that is currently most often used for this purpose. The method can be used to generate approximations to attain any desired trade-off between accuracy and computing cost. T.M.

Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 247-255. 24 refs. Research supported by the University of Florida. (AIAA 82-0712)

This paper describes recent analytical and experimental efforts to determine the effects of fiber aspect ratio, fiber spacing, and the visco-elastic properties of constituent materials on the damping and stiffness of aligned discontinuous fiber reinforced polymer matrix composites. This includes the analysis of trade-offs between damping and stiffness as the above parameters are varied. Two different analytical models show that there is an optimum fiber aspect ratio for maximum damping, and that the predicted optimum aspect ratios lie in the range of actual aspect ratios for whiskers and microfibers. Experimental data for E-glass/epoxy specimens is presented for comparison with predictions. (Author)

A82-30107 # **Integrity analyses of surface-flawed aircraft attachment lugs - A new, inexpensive, 3-D alternating method.** T. Nishioka and S. N. Atluri (Georgia Institute of Technology, Atlanta, GA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 287-300. 24 refs. Grant No. AF-AFOSR-81-0057. (AIAA 82-0742)

A new alternating method for the analysis of a quarter-elliptical corner crack is developed. The completely general analytical solution for an embedded crack, in an infinite solid, subject to arbitrary crack-face tractions, is implemented in the present alternating method. The present finite element alternating method results in an inexpensive procedure for routine evaluation of accurate stress intensity factors for flawed structural components. The present alternating method is applied to the analyses of various shapes of quarter-elliptical corner cracks (1) in a brick subject to remote tension, (2) emanating from a hole in finite-thickness plates, subject to remote tension as well as bearing pressure, and (3) emanating from a pin hole in aircraft attachment lugs subject to simulated pin loading. The results for the problem (1) and (2) are compared with those available in literature. For the problem (3) the stress intensity factors, and their parametric variations for the corner cracks of various shapes are presented. (Author)

A82-30109 # **737 graphite-epoxy horizontal stabilizer certification.** J. E. McCarty, R. W. Johnson, and D. R. Wilson (Boeing Commercial Airplane Co., Seattle, WA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 307-322. 12 refs. (AIAA 82-0745)

The 737 graphite-epoxy horizontal stabilizer was developed as part of the NASA/ACEE Advanced Composite Structures Program, which was initiated in July 1977. Certification requirements were completed in February 1982. The 737 graphite-epoxy horizontal stabilizer, which represents a weight savings of 21.6 percent, will be the first major component of aircraft primary structure to be certified for commercial airline service. The approach taken to obtain certification is considered. This approach complies with FAA regulations while maintaining the philosophy that commercial aircraft structures are certified by structural analysis and supporting test evidence. G.R.

A82-30114 * # **Experimental stress analysis of a thin-walled pressurized torus loaded by contact with a plane.** D. E. Hill (Deere and Co., Moline, IL) and J. R. Baumgarten (Iowa State University of Science and Technology, Ames, IA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 369-373. 6 refs. Grant No. NsG-1605. (AIAA 82-0753)

It is pointed out that pneumatic tires have a large effect on the overall landing characteristics of an aircraft. The dynamic response upon landing and steering are crucial to the safety of the vehicle and the occupants. The present investigation has the objective to compare experimentally determined strains on an inner tube in contact with a flat plate with numerical values obtained on the basis of a finite element prediction, taking into account an employment of the Structural Analysis of General Shells (STAGS). The obtained results suggest that the clamped boundary condition utilized in the STAGS calculation is not exactly simulated by the employed test setup. G.R.

A82-30116 # **Flight qualification of composite structures at AMD-BA.** D. Chaumette (Avions Marcel Dassault-Breguet Aviation, Saint-Cloud, Hauts-de-Seine, France). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 381-390. (AIAA 82-0755)

A brief description is provided of the different programs conducted in a French aerospace company, taking into account composite materials employed in the Mirage III rudder, the Mirage F1 horizontal stabilizer, the Mir F1 aileron, the Falcon 50 aileron, and the fin, the rudder, and the elevons of the Mirage 2000. Attention is also given to the introduction of a very new technology in connection with the development of the Super-Mirage 4000, an experimental Alpha Jet empennage, and the Falcon 10 wing. The design of the Falcon 10 wing utilizes integrally stiffened carbon-fiber panels. G.R.

A82-30117 # **On the characterization of damages in graphite-epoxy composites.** S. V. Hanagud and R. G. Clinton, Jr. (Georgia Institute of Technology, Atlanta, GA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 391-404. 39 refs. (AIAA 82-0757)

Flaws are created in graphite-epoxy composites when they are exposed to an environment of high moisture and elevated temperature. The possibility of nondestructively identifying these flawed states and quantitatively estimating the flaws have been attempted by the measurement and analysis of acoustic emission events, counts per events and amplitude distribution. In particular cross ply woven composite laminates have been studied in undamaged and damaged states. Techniques and methods of standardizing the test procedures have also been discussed. (Author)

A82-30118 * # **Environmental and high strain rate effects on composites for engine applications.** C. C. Chamis and G. T. Smith (NASA, Lewis Research Center, Cleveland, OH). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 405-419. 9 refs. (AIAA 82-0758)

The complex environmental and loading conditions experienced by many turbine engine components impose severe durability and damage tolerance requirements for component materials. Programs are being conducted to establish the structural performance of composite materials under anticipated engine operating environments. A description is presented of the results obtained in connection with several of these programs. A comparison of predicted and measured hygrothermal effects is considered along with hygrothermal effects on defect growth, high strain rate effects on composite mechanical properties, dynamic stress intensity factors for composites, and the indentation laws for composite impact analysis. G.R.

A82-30119 # **A computerized system for the application of fracture tracking data to aircraft management for the C-5A military airlift transport.** D. V. Finkle and J. S. Wilson (Lockheed-Georgia Co., Marietta, GA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 429-434. USAF-supported research. (AIAA 82-0760)

The Aircraft Operational Suitability Program (AOSP) is a computerized system which provides the United States Air Force a means by which to assess the impact of day-to-day aircraft operations on structural inspection schedules and structural life reserve hours for the C-5A. The AOSP uses data generated by the C-5A individual aircraft fracture tracking system and features operations via remote computer terminal hookups. Specific operations of the AOSP include evaluations of the relative severity of proposed missions and the impact of proposed missions on established structural inspection and modification schedules. A82-30125 # **High temperature, short term tensile strength of C6000/PMR-15 graphite polyimide.** P. R. DiGiovanni and D. Paterson (Raytheon Co., Missile Systems Div., Bedford, MA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1. New York, American Institute of Aeronautics and Astronautics, 1982, p. 487-492. 5 refs. (AIAA 82-0711)

Tensile tests were conducted on 0 deg unidirectionally reinforced Celion 6000 graphite fibers in PMR 15 polyimide matrix. Tensile strengths for coupons subjected to short and long term uniform temperatures were obtained. Thick coupons, heated on one side to produce significant transient through thickness temperature gradients, were tested and compared to the strength of specimens with uniform temperature distributions. All coupons were radiantly heated and reached maximum test temperatures within 15 sec. Tensile loads were applied to the coupons after 15 sec of elevated temperature exposure. Loading rates were selected so that specimen failures occurred within a maximum of 45 sec after reaching the test temperature. Results indicate that significant tensile strength remains beyond the material post cure temperature. (Author)

A82-30137 # **An automated technique for improving modal test/analysis correlation.** D. T. Grossman (McDonnell Aircraft Co., St. Louis, MO). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 68-76. 7 refs. (AIAA 82-0640)

An automated technique for adjusting individual mass and stiffness elements to improve the correlation of analytical frequency and mode shape data with ground vibration test results is described. Perturbation formulae are used to calculate derivatives of a 'correlation coefficient' representing the overall similarity of the analytical and experimental results. A special iterative routine is developed to maximize this quantity and thus improve the overall correlation. The technique allows the user to take advantage of engineering judgment, produces physically realizable answers, and does not require the starting values of the variables to be near the final answers. Sample results are given. (Author)

A82-30138 # **Pressure measurements on twin vertical tails in buffeting flow.** W. E. Triplett (McDonnell Aircraft Co., St. Louis, MO). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 77-83. USAF-sponsored research. (AIAA 82-0641)

Buffeting pressures were measured on the vertical tail surfaces of a 13 percent F-15 model in a low-speed wind tunnel. Test variables included dynamic pressure, aircraft angle-of-attack, vertical tail incidence and rudder deflection. Pressure transducers were flush mounted on rigid and flexible tails. Steady and unsteady pressures were obtained from the transducers at levels as low as 0.1 percent full scale. The steady pressures were integrated for aerodynamic coefficients and the unsteady pressures were reduced to spectral densities. The pressures are maximum at approximately 22 deg angle-of-attack and are significantly affected by tail flexibility. (Author)

A82-30139 # **A wind-tunnel study of the aerodynamic characteristics of a slotted versus smooth-skin supercritical wing.** W. F. Grosser (Lockheed-Georgia Co., Marietta, GA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 84-93. (AIAA 82-0642)

Wind-tunnel research test data indicate that flutter characteristics at transonic speeds may be different for each supercritical airfoil configuration. Therefore, high-speed flutter testing for limited structural parameters may be inadequate. Models with sectionalized airfoils provide an economical construction method for easily varying important flutter parameters, while testing smooth-skin models is an expensive and difficult way to conduct parametric studies. A wind-tunnel test was performed to evaluate the effects of sectionalized model construction on aerodynamic behavior in the transonic speed range. The results indicate that sectionalized airfoils may not significantly affect supercritical flutter aerodynamics. (Author)

A82-30140 * # **Evaluation of four subcritical response methods for on-line prediction of flutter onset in wind-tunnel tests.** C. L. Ruhlin, J. J. Watson, R. H. Ricketts, and R. V. Doggett, Jr. (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 94-101. 7 refs. (AIAA 82-0644)

Four subcritical response methods were evaluated for on-line use in transonic wind-tunnel tests where the flutter model is excited solely by airstream turbulence. The methods were: randomdec, power-spectral-density, peak-hold, and cross-spectrum. Subcritical response data were obtained during tests in the Langley Transonic Dynamics Tunnel of a cantilevered flutter model wing. The test procedure was to maintain a constant Mach number and increase the dynamic pressure (q) in incremental steps. The four methods provided damping trends by which the flutter mode could be tracked and extrapolated to a flutter-onset q. A hard flutter point was obtained at M = 0.82. The peak-mold and cross-spectrum methods gave reliable results and could be most readily used for on-line testing. (Author)

A82-30141 # **Test demonstration of digital control of wing/store flutter.** E. H. Johnson, C. Hwang, W. S. Pi, D. F. Kesler, D. S. Joshi (Northrop Corp., Aircraft Div., Hawthorne, CA), and C. A. Harvey (Honeywell, Inc., Minneapolis, MN). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 102-110. 8 refs. Contract No. F33615-80-C-3217. (AIAA 82-0645)

Methods of digital control have been applied to the demonstration of the suppression of wing/store flutter. Digital control laws were developed by applying a modified Jordan canonical transformation to a state variable formulation of a control law synthesized originally for an analog system. After performing a real time simulation of the digital control system at Northrop's Hawthorne facilities, the system was tested in the Transonic Dynamics Tunnel at the NASA Langley Research Center. The results of the test showed that the performance of the digital controller was comparable to that of analog controllers. Attention during the test was focused on the insertion of adequate antialiasing filters, the effects of sample time and on the compensation for phase lags introduced by the digital control process. (Author)

A82-30142 # **Flutter of forward swept wings, analyses and tests.** T. A. Weisshaar, T. A. Zeiler (Purdue University, West Lafayette, IN), T. J. Hertz, and M. H. Shirk (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 111-121. 20 refs. (AIAA 82-0646)

The forward swept wing bndy-freedom flutter phenomenon and the Flight Dynamics Laboratory test program to investigate this phenomenon are discussed. Subsonic wind tunnel flutter tests of a variable sweep, forward swept wing model incorporating the rigid body fuselage pitch degree of freedom are conducted, and results illustrate the effects of flutter speed of static margin, wing sweep and composite wing stiffness. The phenomenon occurs well below the fixed root wing divergence speed, and the primary cause of instability is found to be a coupling between the short period and the wing fundamental bending mode. At the onset of body freedom flutter, significant amounts of pitch, plunge and bending motion are present in the aeroelastic and flight mechanics modes. Both decreasing aircraft static margin and decreasing the streamwise angle of attack in the fundamental wing bending mode tend to increase the body-freedom flutter speed. D.L.G.

simulated, partial-chord, laminar-flow-control glove. Horizontal-tail effects were also briefly examined. The tests covered a range of Mach numbers from 0.40 to 0.82 and lift coefficients from 0.20 to 0.55. Oil-flow photographs of the wing at selected conditions are included. Author

DRAG REDUCTION USING PNEUMATIC TURBULATORS

Karl-Heinz Horstmann and Armin Quast Sep. 1981 54 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-743)
(DFVLR-FB-81-33) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 11,40

Reduction of the additional drag, caused by laminar separation bubbles in airfoils and fuselages at Reynolds numbers below 5 million, was investigated theoretically and experimentally. By blowing from a row of holes located at the separation line, the laminar bubble is destroyed and drag is reduced considerably. Drag reduction due to blowing is naturally smaller at lower Reynolds numbers, the bubbles being smaller. The Reynolds number range with low section drag increases if pneumatic turbulators are used in the profile design. Author (ESA)

AEROELASTIC PROPERTIES OF WINGS IN TRANSONIC FLOW

R. J. Zwaan 24 Feb. 1981 51 p refs Presented at Lecture Ser. on Unsteady Airloads and Aeroelastic Probl. in Separated and Transonic Flow, Rhode-St.-Genese, Belgium, 9-13 Mar. 1981
(NLR-MP-81005-U) Avail: NTIS HC A04/MF A01

Literature on transonic flutter characteristics of wings, especially the transonic dip phenomenon in the flutter boundaries, was reviewed. The transonic dip occurs most distinctly with sweptback wings. The dip is caused by the phase lag of the lift due to the fundamental wing bending mode and corresponds to a single-mode flutter mechanism. The dip can be predicted qualitatively using methods for inviscid transonic unsteady air loads. Quasi-steady transonic methods are not wholly reliable. The dip becomes relatively deeper with increasing wing-to-air mass ratio. The dip can become more pronounced for a supercritical wing than for a conventional wing. The dip occurs at design conditions as well as off-design conditions. In case of flow separation, a narrow dip which depends strongly on boundary layer conditions and the spatial distribution of the separated flow can occur. Author (ESA)

AEROSPATIALE SURVEY OF WIND TUNNEL TESTING OF SMALL AND LARGE SCALE ROTORS

J. P. Silvani and A. Vuillet Paris 1981 17 p refs Presented at the 7th European Rotocraft And Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany 8-11 Sep. 1981; sponsored by DFVLR, Cologne
(SNIAS-821-210-107) Avail: NTIS HC A02/MF A01

Wind tunnel tests on Mach scaled rotors (1/10 and 1/3) capable of a wide range of shaft angle settings are summarized. The 1/3 model hub is fitted with a swashplate, general and cyclic inputs. Continuous conversion of a tilt rotor was achieved. Speeds > 500 km/hr were attained with conventional rotors. During autorotation high lift coefficients are obtained without major drag penalties. The OA family 2-D airfoils characteristic improvements were checked. Results show good behaviour throughout the entire rotor flight envelope; a 3% improvement on the rotor figure of merit at nominal thrust in hover; a 9% power improvement at nominal thrust and 300 km/hr in level fight; and 12% maximum thrust improvement at stall. TRANSPORT AIRCRAFT ACCIDENT DYNAMICS Final Technical Report, 11 Feb. 1980 - Mar. 1982

A. Cominsky Atlantic City FAA Mar. 1982 178 p
(Contract NAS1-16111)
(NASA-CR-165850; FAA-RD-74-12; NAS 1.26:165850) Avail: NTIS HC A09/MF A01 CSCL 01C

A study was carried out of 112 impact survivable jet transport aircraft accidents (world wide) of 27,700 kg (60,000 lb.) aircraft and up extending over the last 20 years. This study centered on the effect of impact and the follow-on events on aircraft structures and was confined to the approach, landing and takeoff segments of the flight. The significant characteristics, frequency of occurrence and the effect on the occupants of the above data base were studied and categorized with a view to establishing typical impact scenarios for use as a basis of verifying the effectiveness of potential safety concepts. Studies were also carried out of related subjects such as: (1) assessment of advanced materials; (2) human tolerance to impact; (3) merit functions for safety concepts; and (4) impact analysis and test methods. SPECIAL INVESTIGATION REPORT: EVACUATION OF UNITED AIRLINES DC-8-61, SKY HARBOR INTERNATIONAL AIRPORT, PHOENIX, ARIZONA, DECEMBER 29, 1980
9 Sep. 1981 29 p refs
(PB82-115619; NTSB-SIR-81-4) Avail: NTIS HC A03/MF A01 CSCL 01B

On December 29, 1980, United Airlines Charter Flight 5820, a DC-8-61, with 238 passengers and a crew of 9, was evacuated at Sky Harbor International Airport, Phoenix, Arizona, when the failure of the rear landing gear bogie beam resulted in a fire in the aircraft's right main landing gear. The cockpit crew was erroneously advised of an engine fire by the airport tower and began emergency shutdown procedures. The captain initiated the evacuation after all electrical power had been shut down and the public address and cabin interphone systems were without power. Therefore, the second officer had to give the evacuation orders to passengers and flight attendants by 'word of mouth'. As a result of its special investigation and its previous work on the subject of evacuations, the Safety Board has made recommendations to the Federal Aviation Administration to improve the availability of emergency communication equipment and to promote its use.

A TACTUAL DISPLAY AID FOR PRIMARY FLIGHT TRAINING Final Report, 1 Jul. 1976 - 15 Dec. 1978
Richard D. Gilson Jul. 1979 76 p refs
(Contract NAS2-8954)
(NASA-CR-166242; NAS 1.26:166242) Avail: NTIS HC A05/MF A01 CSCL 01D

A means of flight instruction is discussed. In addition to verbal assistance, control feedback was continously presented via a nonvisual means utilizing touch. A kinesthetic-tactile (KT) display was used as a readout and tracking device for a computer generated signal of desired angle of attack during the approach and landing. Airspeed and glide path information was presented via KT or visual heads up display techniques. Performance with the heads up display of pitch information was shown to be significantly better than performance with the KT pitch display. Testing without the displays showed that novice pilots who had received tactile pitch error information performed both pitch and throttle control tasks significantly better then those who had received the same information from the visual heads up display of pitch during the test series of approaches to landing. AIRFIELD VISUAL AIDS RESEARCH AT THE ROYAL AIRCRAFT ESTABLISHMENT
A. J. Smith 2 Oct. 1981 29 p refs Presented at the 1981 Aviation Lighting Sen., Williamsburg, Virginia, 9-13 Nov. 1981; Sponsored by Illuminating Engineering Society of North America
(RAE-TM-FS-431; BR80893) Avail: NTIS HC A03/MF A01

The precision approach path indicator (PAPI) is described and helicopter lighting aids are discussed. The PAPI system indicates correct glide slope at ranges > 10 km under good visibility conditions and provides information up to 300 m from touchdown. Two color light projector units, consisting of three simple optical projectors side by side in a box, tell the pilot if he is too high, too low, or on slope by the combination of red and white lights. Trials show that it can be used by a wide range of civil and military aircraft, e.g., the VC-10, small private airplanes, or helicopters. A mathematical model which predicts what pilots can see when landing in fog was used in order to optimize proposed approach lighting patterns for helicopters. If the lighting pattern is 730 m long, initial contact is possible at altitudes > 100 m. Lighting trials show that red stop bar lighting and green taxiway centerline need further improvement.

ANALYSIS AND FLIGHT EVALUATION OF A SMALL, FIXED-WING AIRCRAFT EQUIPPED WITH HINGED PLATE SPOILERS
John W. Olcott, Edward Seckel, and David R. Ellis Sep. 1981 161 p refs
(Contract NAS2-6589)
(NASA-CR-166247; NAS 1.26:166247) Avail: NTIS HC A08/MF A01 CSCL 01C

The results of a four phase effort to evaluate the application of hinged plate spoilers/dive brakes to a small general aviation aircraft are presented. The test vehicle was a single engine light aircraft modified with an experimental set of upper surface spoilers and lower surface dive brakes similar to the type used on sailplanes. The lift, drag, stick free stability, trim, and dynamic response characteristics of four different spoiler/dive brake configurations were determined. Tests also were conducted, under a wide range of flight conditions and with pilots of various experience levels, to determine the most favorable methods of spoiler control and to evaluate how spoilers might best be used

AIAA/ASME/ASCE/AHS Struct., Structural Dyn. and Mater. Conf., New Orleans, 10-12 May 1982
(NASA-TM-83295; NAS 1.15:83295; AIAA-PAPER-82-0685)
Avail: NTIS HC A02/MF A01 CSCL 01A

Transonic aeroelastic solutions based upon the transonic small perturbation potential equation were studied. Time-marching transient solutions of plunging and pitching airfoils were analyzed using a complex exponential modal identification technique, and seven alternative integration techniques for the structural equations were evaluated. The HYTRAN2 code was used to determine transonic flutter boundaries versus Mach number and angle-of-attack for NACA 64A010 and MBB A-3 airfoils. In the code, a monotone differencing method, which eliminates leading edge expansion shocks, is used to solve the potential equation. When the effect of static pitching moment upon the angle-of-attack is included, the MBB A-3 airfoil can have multiple flutter speeds at a given Mach number. T.M.

A NUMERICAL INVESTIGATION OF TWO-DIMENSIONAL, SUBSONIC, LINEAR, WIND TUNNEL INTERFERENCE THEORY
N. Pollock Jun. 1981 40 p refs
(ARL/AERO-NOTE-403; AR-002-294) Avail: NTIS HC A03/MF A01

An investigation of two-dimensional, subsonic, linear wind tunnel interference using the computer program TSFOIL as a numerical tunnel was carried out for solid, open, porous and slotted walls. The use of a computer code rather than physical experiment has the advantage that test parameters such as wall characteristics and model chord can be varied widely at low cost. The aim was to determine the relative merits of the various walls and to establish the limits of applicability of linear interference theory. The most favorable wall type was found to be an ideal slotted wall with the slot parameter appropriate for zero solid blockage (F = 1.1844). For this wall type linear interference theory accurately predicted lift and pitching moment corrections for tunnel height to chord ratios greater than 2 and supersonic region height to tunnel height ratios less than 0.2. UNSTEADY PRESSURE MEASUREMENTS AT STALL AND BUFFETING
Peter Bublitz Apr. 1979 52 p refs In GERMAN; ENGLISH summary Translation was announced as N81-21041
(DFVLR-Mitt-79-09) Avail: NTIS HC A04/MF A01

The fluid dynamic phenomena of stall and buffeting, as well as the marked effects on elastic structures are described. By applying the generalized form of the equations of motion and the Fourier transforms, the governing equation of the dynamic response problem is concisely derived. Quantities needed to treat the problem under consideration are determined. Then the test installation and the relevant test method are depicted to some extent, in which the direct pressure measuring method and the statistical evaluation method are the main topics. A trapezoidal stalled wing with and without strake are tested. The efficiency of the test procedure is shown and some insight into the dynamic behavior of the stall is provided. S.L.

APPROXIMATE METHOD FOR PREDICTING SUPERSONIC NORMAL FORCE COEFFICIENT VERY-LOW-ASPECT-RATIO LIFTING SURFACES
E. F. Lucero 14 May 1981 32 p refs Sponsored in part by NAVSEA 62R
(AD-A111770) Avail: NTIS HC A03/MF A01 CSCL 20/4

A simple, empirical method has been developed for predicting at supersonic speeds the normal force coefficient, C(N), (including carryover) of very-low-aspect ratio lifting surfaces mounted on bodies of revolution. Predicted values of C(N) using this method are shown to be in good agreement with test data obtained on both thick and thin surfaces, at Mach numbers from about 2.5 to 7.7 and angles of attack to 24 degrees. WIND TUNNEL INVESTIGATIONS OF SAILPLANE FUSELAGES WITH DIFFERENT LACINGS AND WING SETTINGS [WINDKANALUNTERSUCHUNGEN AN SEGELFLUGZEUG-RUEMPFEN MIT VERSCHIEDENER EINSCHNUERUNG UND FLUEGELANORDNUNG]
Rolf Radespiel 1981 14 p In GERMAN
Avail: NTIS HC A02/MF A01

The parameter fuselage lacing, sailplane wing setting and fuselage nose radius of nine glider configurations were investigated in a wind tunnel. Laminar peeling off blisters were found on strongly laced fuselages. These in the transition between fuselage and wing are essential for the harmful aerodynamic resistance. Resistance reduction was measured for increasing lacing and wing setting in the rear. These results are only valid for undisturbed flow on the fuselage front part, a condition which is not yet fulfilled for original sailplanes. Author (ESA)

COMMERCIAL JET TRANSPORT CRASHWORTHINESS
E. Widmayer and Otto B. Brende Apr. 1982 255 p refs
(Contract NAS1-16076)
(NASA-CR-165849; NAS 1.26:165849; DOT-FAA-CT-82-86)
Avail: NTIS HC A12/MF A01 CSCL 01C

The results of a study to identify areas of research and approaches that may result in improved occupant survivability and crashworthiness of transport aircraft are given. The study defines areas of structural crashworthiness for transport aircraft which might form the basis for a research program. A 10-year research and development program to improve the structural impact resistance of general aviation and commercial jet transport aircraft is planned. As part of this program parallel studies were conducted to review the accident experience of commercial transport aircraft, assess the accident performance of structural components and the status of impact resistance technology, and recommend areas of research and development for that 10-year plan. The results of that study are also given. R.J.F.

HELICOPTER HANDLING QUALITIES
Apr. 1982 243 p refs Proceedings of the special meeting held at Moffett Field, Calif., 14-15 Apr. 1982; sponsored by the American Helicopter Society
(NASA-CP-2219; A-8891; NAS 1.55:2219) Avail: NTIS HC A11/MF A01 CSCL 01C

Helicopters are used by the military and civilian communities for a variety of tasks and must be capable of operating in poor weather conditions and at night. Accompanying extended helicopter operations is a significant increase in pilot workload and a need for better handling qualities. An overview of the status and problems in the development and specification of helicopter handling-qualities criteria is presented. Topics for future research efforts by government and industry are highlighted.

VTOL AND VSTOL HANDLING QUALITIES SPECIFICATIONS, AN OVERVIEW OF THE CURRENT STATUS
Kevin W. Goldstein *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 1-7 refs

Avail: NTIS HC A11/MF A01 CSCL 01C

The highlights of a comparative analysis between the current helicopter and VSTOL specifications and four representative rotary wing aircraft are presented. Longitudinal, lateral, and directional control power and dynamic stability characteristics were analyzed for hovering conditions. Forward flight static and dynamic stability were analyzed for the longitudinal and lateral-directional axes. Results of the analyses in terms of the applicability/utility of the MIL-H-8501A criteria are presented for each of the above areas. The review of the MIL-H-8301A criteria against those in MIL-F-83300 and AGARD 577 indicate many areas in which MIL-H-8501A does not give adequate design guidance. T.M.

BOEING 234 FLIGHT CONTROL DEVELOPMENT
James J. Morris *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 15-22

Avail: NTIS HC A11/MF A01 CSCL 01C

The Boeing 234 is the commercially certified derivative of the CH-47 Chinook. The automatic flight control system and flight director with coupler were designed to reduce pilot work-load for missions of approximately six hour duration during VFR, IFR, day and night conditions. The AFCS system for the 234 is essentially the same system as developed for the CH-47D, which has airspeed hold, attitude hold, and maneuver enhancement in all three axes. The system also has the capability to couple to the Sperry Helcis flight director system which provides for enroute navigation and landing approaches. Certification testing was completed, by both the FAA and CAA, to FAR Part 29 for Transport Category Rotorcraft and BCAR Section G: Rotorcraft. The aircraft was certified for civil operation in June 1981. Author

INFLUENCE OF MANEUVERABILITY ON HELICOPTER COMBAT EFFECTIVENESS
Michael Falco and Roger Smith (Army Aviation Research and Development Command, St. Louis, Mo.) *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 23-33 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

A computational procedure employing a stochastic learning method in conjunction with dynamic simulation of helicopter flight and weapon system operation was used to derive helicopter maneuvering strategies. The derived strategies maximize either survival or kill probability and are in the form of a feedback control based upon threat visual or warning system cues. Maneuverability parameters implicit in the strategy development include maximum longitudinal acceleration and deceleration, maximum sustained and transient load factor turn rate at forward speed, and maximum pedal turn rate and lateral acceleration at hover. Results are presented in terms of probability of skill for all combat initial conditions for two threat categories. T.M.

FLIGHT TESTS FOR THE ASSESSMENT OF TASK PERFORMANCE AND CONTROL ACTIVITY
Heinz-Juergen Pausder and Dieter Hummes *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 35-46 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

The tests were performed with the helicopters BO 105 and UH-1D. Closely connected with tactical demands the six test pilots' task was to minimize the time and the altitude over the obstacles. The data reduction yields statistical evaluation parameters describing the control activity of the pilots and the achieved task performance. The results are shown in form of evaluation diagrams. Additionally dolphin tests with varied control strategy were performed to get more insight into the influence of control techniques. From these test results recommendations can be derived to emphasize the direct force control and to reduce the collective to pitch crosscoupling for the dolphin. T.M.

UNIFIED RESULTS OF SEVERAL ANALYTICAL AND EXPERIMENTAL STUDIES OF HELICOPTER HANDLING QUALITIES IN VISUAL TERRAIN FLIGHT
Robert T. N. Chen *In its* Helicopter Handling Qualities Apr. 1982 p 59-74 refs

Avail: NTIS HC A11/MF A01 CSCL 01C

The studies were undertaken to investigate the effects of rotor design parameters, interaxis coupling, and various levels of stability and control augmentation on the flying qualities of helicopters performing low-level, terrain-flying tasks in visual meteorological conditions. Some unified results are presented, and the validity and limitations of the flying-qualities data obtained are interpreted. Selected results, related to various design parameters, provide guidelines for the preliminary design of rotor systems and aircraft augmentation systems. T.M.

N82-23216*# Boeing Vertol Co., Philadelphia, Pa.
AN ASSESSMENT OF VARIOUS SIDE-STICK CONTROLLER/STABILITY AND CONTROL AUGMENTATION SYSTEMS FOR NIGHT NAP-OF-EARTH FLIGHT USING PILOTED SIMULATION
Kenneth H. Landis and Edwin W. Aiken (Army Research and Technology Labs., Moffett Field, Calif.) *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 75-96 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

Several night nap-of-the-earth mission tasks were evaluated using a helmet-mounted display which provided a limited field-of-view image with superimposed flight control symbology. A wide range of stability and control augmentation designs was investigated. Variations in controller force-deflection characteristics and the number of axes controlled through an integrated side-stick controller were studied. In general, a small displacement controller is preferred over a stiffstick controller particularly for maneuvering flight. Higher levels of stability augmentation were required for IMC tasks to provide handling qualities comparable to those achieved for the same tasks conducted under simulated visual flight conditions. T.M.

DEFINITION OF DISPLAY/CONTROL REQUIREMENTS FOR ASSAULT TRANSPORT NIGHT/ADVERSE WEATHER CAPABILITY
R. Joseph Milelli, Gary W. Mowery, and Carmen Pontelandolfo (Naval Air Development Center, Warminister, Pa.) *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 97-107 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

A Helicopter Night Vision System was developed to improve low-altitude night and/or adverse weather assult transport capabilities. Man-in-the-loop simulation experiments were performed to define the minimum display and control requirements for the assult transport mission and investigate forward looking infrared sensor requirements, along with alternative displays such as panel mounted displays (PMD) helmet mounted displays (HMD), and integrated control display units. Also explored were navigation requirements, pilot/copilot interaction, and overall cockpit arrangement. Pilot use of an HMD and copilot use of a PMD appear as both the preferred and most effective night navigation combination. M.D.K.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discusion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 151)

AUGUST 1982

IAA ENTRIES

A82-[illegible] Occurrence of fretting fatigue failures in practice. P. J. E. Forsyth (Royal Aircraft Establishment, Materials Dept., Farnborough, Hants., England). In: Fretting fatigue. London, Applied Science Publishers, Ltd., 1981, p. 99-125.

The basic characteristics of fretting fatigue are identified and practical engineering situations where fretting fatigue problems can arise are discussed. The discussion includes both commonly observed cases, such as flanges and loaded holes, and less common cases such as that of an aircraft lift strut stabilizing point where aerodynamic vibrations are developed in the member. It is pointed out that once a fretting fatigue failure has occurred in service, remedial measures can be found which will eliminate the problem. However, difficulties still arise in applications where the possibilities of fretting have not been identified at the design stage, and in pinning combinations where the engineering variables are difficult to control and where anti-fretting compounds are difficult to maintain in situ. V.L.

A82-[illegible] * Finite element thermal analysis of convectively-cooled aircraft structures. A. G. Wieting (NASA, Langley Research Center, Hampton, VA) and E. A. Thornton (Old Dominion University, Norfolk, VA). In: Numerical methods in heat transfer. Chichester, Sussex, England and New York, Wiley-Interscience, 1981, p. 431-443. 8 refs.

The design complexity and size of convectively-cooled engine and airframe structures for hypersonic transports necessitate the use of large general purpose computer programs for both thermal and structural analyses. Generally, thermal analyses are based on the lumped-parameter finite difference technique, and structural analyses are based on the finite element technique. Differences in these techniques make it difficult to achieve an efficient interface. It appears, therefore, desirable to conduct an integrated analysis based on a common technique. A summary is provided of efforts by NASA concerned with the development of an integrated thermal-structural analysis capability using the finite element method. Particular attention is given to the development of conduction/forced-convection finite element methodology and applications which illustrate the capabilities of the developed concepts. G.R.

A82-[illegible] The gas turbine engine. D. Driver, D. W. Hall, and G. W. Meetham (Rolls-Royce, Ltd., Derby, England). In: The development of gas turbine materials. London, Applied Science Publishers, 1981, p. 1-30. [illegible] refs.

An historical account is given of the developments in gas turbine engine mechanical design which, by increasing operating temperature requirements in their evolution towards greater thrust and lower fuel consumption, have strongly affected the choice of component materials. The desire to reduce powerplant weight, and especially the weight of rotating components, has also been a significant factor in the development of materials. Compressor materials, which were largely aluminum alloy in the earliest gas turbine engines, were supplemented by steels as temperatures rose above [illegible] C in the early 1950s; the development of high specific strength titanium alloys led to their application in compressor blades and casings after [illegible]. Combustion chamber and turbine materials have been [illegible] increasingly corrosion-resistant nickel-based superalloys. Attention is also given to drive shafts and bearings. O.C.

A82-[illegible] Composite materials. R. H. Turner, A. W. Johnson, and C. G. Hannah (Rolls-Royce, Ltd., Derby, England). In: The development of gas turbine materials. London, Applied Science Publishers, 1981, p. 121-140. 16 refs.

Since the development of the RB 162 engine, composite materials such as glass fiber/epoxy, glass fiber/polyimide, and carbon or graphite fiber/epoxy have displaced conventional metallic components in aircraft gas turbines through a combination of lower weight and superior performance. Applications of such composites include compressor blades and casings, fan blades, nacelle components and thrust reversers. Emphasis is put on the development of pressure-assisted resin injection and the associated molding resin system for the successful application of carbon fiber reinforced plastics. The prospective development of high-temperature, metal-matrix composites able to operate above the polymer limit of 300 C is also considered. Such composites will employ alumina, carbon and silicon carbide fibers in the reinforcement of aluminum and titanium alloy matrices. O.C.

A82-[illegible] Sheet materials - Fabrication and joining. [illegible] Hicks (Lucas Aerospace, Ltd., Fabrication Div., Burnley, Lancs., England). In: The development of gas turbine materials. London, Applied Science Publishers, 1981, p. 229-258. 47 refs.

Aircraft gas turbine engine sheet-fabricated components include fan casings, combustion chambers, and bypass and exhaust ducts of often complex shape which must be produced to high standards. Their production sequence typically entails (1) making sheet metal parts by bending, drawing, stretchforming, spinning and roll forming, after free-edge trimming and cleaning; (2) the machining of those forgings and castings which are to become an integral part of the fabricated assembly; (3) degreasing, pickling and descaling of the parts in preparation for welding; (4) tungsten inert gas or resistance welding; and (5) stress-relieving of the welded assembly and final heat treatment. [illegible] given to the properties of such sheet alloys as Nimonic 75, Hastelloy X, and Jethete M 152. [illegible]

A82-[illegible] Processing and uses of carbon fiber reinforced plastics. [illegible] Verarbeitung und Anwendung kohlenstoff[illegible] Kunststoffe, Stuttgart, [illegible] VDI-Verlag GmbH, 1981, [illegible]

After an introductory paper on the processing and uses of carbon fiber reinforced plastics (CFRP), consideration is given to high-strength carbon fibers based on polyacrylonitrile, high-modulus carbon fibers made from pitch, the surface treatment of carbon fibers, the nondestructive testing of CFRP, and [illegible] Also discussed are CFRP [illegible] the CFP design and construction of the Alpha-Jet elevator unit, the design and [illegible] analysis of the Airbus CFP rudder [illegible] components of CFP [illegible] and the use of [illegible] reinforced [illegible]

A82-[illegible] [illegible] for the Airbus [illegible] carbon-fiber reinforced plastic. H. Conen and H. Kolesnik (Dornier GmbH, Friedrichshafen, West Germany). In: Processing and uses of

A82-30143 * # **Measured and calculated effects of angle of attack on the transonic flutter of a supercritical wing.** E. C. Yates, Jr., E. C. Wynne, and M. G. Farmer (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 122-144. 19 refs. (AIAA 82-0647)

The effects of angle of attack between 0 and 4 degrees were studied. The results indicate that increasing angle of attack from zero can produce substantial changes in the transonic flutter characteristics that are favorable or unfavorable depending on Mach number and angle of attack. The bottom of the transonic flutter-boundary 'bucket' is shown to occur at lower Mach number as angle of attack increases. These flutter results correlate well with the effects of Mach number and angle of attack on aerodynamic behavior, especially on the development of transonic flow phenomena. The calculated flutter characteristics are in good agreement with the experimental data at zero angle of attack, but at nonzero angles of attack the experiments show sharply declining and backward-turning transonic flutter boundaries that are not indicated by the calculations. These may be caused by variations in static aeroelastic deformation. C.D.

A82-30144 # **Integrated structural analysis and design support for advanced launch vehicles.** D. G. Wong, R. D. Bousquet, and C. R. Fuller (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 145-150. 5 refs. (AIAA 82-0675)

The paper discusses a system incorporating the latest developments in computer hardware and software, conceived in accordance with a five year plan initiated to support future advanced launch vehicle programs at the Lockheed Missiles and Space Company. Engineering requirements for the integrated system forming the basis for the department upgrades are presented. Software attributes are discussed, including program modularity, data management, and programming standards. Hardware attributes are also presented, and include system definition and design, communication network links, and various graphical capabilities. D.L.G.

A82-30145 # **Bonded aluminum honeycomb - Aircraft flight surface primary structure application.** T. R. Logan (Boeing Commercial Airplane Co., Seattle, WA) and U. Soudak (Israel Aircraft Industries, Ltd., Tel Aviv, Israel). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 151-156. 9 refs. (AIAA 82-0676)

The first phase is discussed of a detail design and testing program undertaken to establish cost and weight data for a point-design application and to provide a basis for full-scale development and certification of a bonded aluminum honeycomb empennage structural box. The baseline design is a built-up, mechanically fastened skin/stringer configuration. Structural design goals, inherent advantages and principal constraints of the bonded design are given. Design allowables, optimum design, and substructure arrangement are discussed in detail. A preliminary study demonstrates a significant 9.9 to 14.7 percent weight saving and a 20 percent part count reduction. Potential overall manufacturing cost reduction is estimated at 40 percent. C.D.

A82-30146 * # **Design considerations and experiences in the use of composite material for an aeroelastic research wing.** C. V. Eckstrom (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA) and C. V. Spain (Kentron Technical Center, Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 157-165. 15 refs. (AIAA 82-0678)

Experiences in using composite skin material on an aeroelastic research wing used in flight flutter testing are described. Significant variations in skin shear modulus due to stress and temperature were encountered with the original fiberglass laminate skin designed to minimize wing torsional stiffness. These variations along with the sensitivity of wing torsional stiffness to the skin-to-frame attachment method complicated the structural model vibration mode predictions. A wing skin redesign with different fiber orientation and a reduction in the amount of skin-to-frame bonding resulted in more predictable modal characteristics without sacrificing design objectives. Design and modeling considerations for future applications are discussed. (Author)

A82-30147 # **Durability and damage tolerance control plans for USAF aircraft.** M. A. Landy and O. L. Smithers (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 166-174. 20 refs. (AIAA 82-0679)

A set of disciplined, integrated procedures involving a number of a contractor's functional organizations is necessary if the requirements for a durable and damage tolerant structure are to be met. To this end, the Air Force requires that Durability and Damage Tolerance Control Plans (DADTCPs) be developed and implemented during aircraft development and manufacturing. DADTCPs define all tasks necessary to ensure that the final product meets Air Force durability and damage tolerance requirements. Various aspects to DADTCPs will be discussed in this paper. The foundation for a generalized model outlining the tasks in a DADTCP will be presented. Examples from existing DADTCPs will be used to illustrate elements of the generalized model. (Author)

A82-30150 # **Rigid body-structural mode coupling on a forward swept wing aircraft.** G. D. Miller, J. H. Wykes, and M. J. Brosnan (Rockwell International Corp., El Segundo, CA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 201-208. 10 refs. (AIAA 82-0683)

Physical causes of rigid/body wing bending flutter of forward swept wing (FSW) aircraft are discussed, and potential solutions to the phenomenon for a Rockwell design of an FSW demonstrator are considered. The use of active controls technology to design a flutter suppression system in controling the flutter on the demonstrator is discussed, including the integration of the active system with the complete aircraft design to obtain lightweight structure while maintaining strength requirements, structural dynamic stability, and rigid body stability. Improvements in flying qualities, ride qualities and reduction in the gust loads as a result of the active control system are demonstrated. Inertial coupling in addition to wind sweep is found to be a dominant variable causing the phenomenon. D.L.G.

A82-30151 # **Active control of aeroelastic divergence.** R. R. Chipman, A. M. Zislin, and C. Waters (Grumman Aerospace Corp., Bethpage, NY). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 209-219. 15 refs. (AIAA 82-0684)

On forward-swept-wing aircraft, aerodynamic destiffening of the primary wing-bending mode can cause coupling with the short-period mode, potentially resulting in a low-frequency dynamic instability. For a clamped wing, this coupled mechanism degenerates into conventional static wing divergence. Studies of a fundamental analytical model of this mechanism show that active control of the clamped wing is possible only through the use of displacement feedback. Control laws for the clamped wing are evaluated and also assessed when body freedom is restored. Additionally, control laws are synthesized directly for a more refined representation of the unrestrained vehicle. CCV configurations are not considered. (Author)

A82-30153 * # **Static and unsteady pressure measurements on a 50 degree clipped delta wing at M = 0.9.** R. W. Hess, E. C. Wynne, and F. W. Cazier (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2.

New York, American Institute of Aeronautics and Astronautics, 1982, p. 234-242. 7 refs. (AIAA 82-0686)

Static and unsteady pressures were measured on a 50.45 degree clipped delta wing in the Langley Transonic Dynamics Tunnel with Freon as the test medium. Data taken at M = 0.9 is presented for static and oscillatory deflections of the trailing edge control surface and for the wing in pitch. Comparisons of the static measured data are made with results computed using the Bailey-Ballhaus small disturbance code. (Author)

A82-30155 # Transonic time-response analysis of three D.O.F. conventional and supercritical airfoils. T. Y. Yang (Purdue University, West Lafayette, IN) and J. T. Batina. In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 256-266. 30 refs. (AIAA 82-0688)

Aeroelastic time-response analyses are performed for two conventional airfoils, NACA 64A006 and NACA 64A010, and one supercritical airfoil MBB A-3, in small disturbance transonic flow. Response results for forces and displacements were obtained by simultaneously integrating the structural equations of motion with the unsteady aerodynamic forces computed using two transonic codes: LTRAN2-NLR (improved version of LTRAN2 by Houwink and van der Vooren of NLR, the Netherlands) and USTS (Unsteady Transonic Small Perturbation code by Isogai of NAL, Japan). Three d.o.f.'s, plunge, pitch, and aileron pitch, are considered. Flutter analyses are first performed and the results are used as a guideline for time-response parameter selection. Time-response results are presented showing that for each case the flight speed used to obtain neutrally stable responses is either exactly or nearly the same as the flutter speed determined in the separate flutter analysis. Effect of response amplitudes is investigated. Applicability and limitations of the two transonic codes are evaluated, compared, and discussed. Transonic time-response behavior of these airfoils is physically interpreted, discussed, and comparisons are made. (Author)

A82-30156 * # Application of a transonic potential flow code to the static aeroelastic analysis of three-dimensional wings. W. Whitlow, Jr. and R. M. Bennett (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 267-276. 12 refs. (AIAA 82-0689)

A method for including elastic effects in steady, transonic wing analysis is presented. Since the aerodynamic theory is nonlinear, the method requires the coupling of two iterative processes - an aerodynamic analysis and a structural analysis. A full potential analysis code, FL022, is combined with a linear structural analysis to yield aerodynamic load distributions on and deflections of elastic wings. This method was used to analyze an aeroelastically-scaled wind tunnel model of a proposed executive-jet transport wing and an aeroelastic research wing. The results are compared with the corresponding rigid-wing analyses, and some effects of elasticity on the aerodynamic loading are noted. (Author)

A82-30157 * # Comparison between computations and experimental data in unsteady three-dimensional transonic aerodynamics, including aeroelastic applications. P. Guruswamy (Informatics, Inc., Palo Alto, CA) and P. M. Goorjian (NASA, Ames Research Center, Moffett Field, CA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 277-289. 20 refs. (AIAA 82-0690)

Comparisons were made of computed and experimental data in three-dimensional unsteady transonic aerodynamics, including aeroelastic applications. The computer code LTRAN3, which is based on small-disturbance aerodynamic theory, was used to obtain the aerodynamic data. A procedure based on the U-g method was developed to compute flutter boundaries by using the unsteady aerodynamic coefficients obtained from LTRAN3. The experimental data were obtained from available NASA publications. All the studies were conducted for thin, unswept, rectangular wings with circular-arc cross sections. Numerical and experimental steady and unsteady aerodynamic data were compared for a wing with an aspect ratio of 3 and a thickness ratio of 5% at Mach numbers of 0.7 and 0.9. Flutter data were compared for a wing with an aspect ratio of 5. Two thickness ratios, 6% at Mach numbers of 0.715, 0.851, and 0.913, and 4% at Mach number of 0.904, were considered. Based on the unsteady aerodynamic data obtained from LTRAN3, flutter boundaries were computed; they were compared with those obtained from experiments and the code NASTRAN, which uses linear aerodynamics. (Author)

A82-30161 # Analysis of aircraft dynamic behavior in a crash environment. G. Wittlin (Lockheed-California Co., Burbank, CA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 316-325. 20 refs. Army-sponsored research. (AIAA 82-0694)

Differences in the crash environments and design aspects which influence occupant survivability in military and commercial aircraft are discussed. Available analytical techniques for assessing structural behavior during a crash are described. The application of a hybrid technique in assessing aircraft structural behavior and trends in crash environments is provided. Representative mathematical simulations of aircraft crash tests and correlation with light fixed-wing and rotary-wing aircraft test results are shown. The results of a recent FAA/NASA sponsored research program involving the review of transport accidents from 1964-79 and the formulation of potential crash scenarios to be considered with future analysis and test verification are presented. Current and future analytical model studies to ascertain the crash dynamics of large transports are also discussed. (Author)

A82-30162 * # Bird impact analysis package for turbine engine fan blades. M. S. Hirschbein (NASA, Lewis Research Center, Cleveland, OH). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 326-334. 8 refs. (AIAA 82-0696)

A computer program has been developed to analyze the gross structural response of turbine engine fan blades subjected to bird strikes. The program couples a NASTRAN finite element model and modal analysis of a fan blade with a multi-mode bird impact analysis computer program. The impact analysis uses the NASTRAN blade model and a fluid jet model of the bird to interactively calculate blade loading during a bird strike event. The analysis package is computationaly efficient, easy to use and provides a comprehensive history of the gross structual blade response. Example cases are presented for a representative fan blade. (Author)

A82-30168 * # Damage tolerant design using collapse techniques. R. T. Haftka (Virginia Polytechnic Institute and State University, Blacksburg, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 383-386. 13 refs. Grant No. NAG1-168. (AIAA 82-0718)

A new approach to the design of structures for improved global damage tolerance is presented. In its undamaged condition the structure is designed subject to strength, displacement and buckling constraints. In the damaged condition the only constraint is that the structure will not collapse. The collapse load calculation is formulated as a maximization problem and solved by an interior extended penalty function. The design for minimum weight subject to constraints on the undamaged structure and a specified level of the collapse load is a minimization problem which is also solved by a penalty function formulation. Thus the overall problem is of a nested or multilevel optimization. Examples are presented to demonstrate the difference between the present and more traditional approaches. (Author)

A82-30169 # Shape optimization of fiber reinforced composites. S. V. Hanagud, A. Chattapadhyay, and L. Karlovitz (Georgia Institute of Technology, Atlanta, GA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2.

during the approach and landing task. The effects of approach path angle, approach airspeed, and pilot technique using throttle/spoiler integrated control were investigated for day, night, VFR, and IFR approaches and landings. The test results indicated that spoilers offered significant improvements in the vehicle's performance and flying qualities for all elements of the approach and landing task, provided a suitable method of control was available. CONCEPTUAL DESIGN STUDY OF A VISUAL SYSTEM FOR A ROTORCRAFT SIMULATOR AND SOME ADVANCES IN PLATFORM MOTION UTILIZATION Final Report
John B. Sinacori Aug. 1980 33 p refs
(Contract NAS2-10278)
(NASA-CR-166322; NAS 1.26:166322) Avail: NTIS HC A03/MF A01 CSCL 14B

A conceptual design of a visual system for a rotorcraft flight simulator is presented. Also, drive logic elements for a coupled motion base for such a simulator are given. The design is the result of an assessment of many potential arrangements of electro-optical elements and is a concept considered feasible for the application. The motion drive elements represent an example logic for a coupled motion base and is essentially an appeal to the designers of such logic to combine their washout and braking functions. Author

A LINEAR DECOMPOSITION METHOD FOR LARGE OPTIMIZATION PROBLEMS. BLUEPRINT FOR DEVELOPMENT
Jaroslaw Sobieszczanski-Sobieski Feb. 1982 61 p refs
(NASA-TM-83248; NAS 1.15:83248) Avail: NTIS HC A04/MF A01 CSCL 01C

A method is proposed for decomposing large optimization problems encountered in the design of engineering systems such as an aircraft into a number of smaller subproblems. The decomposition is achieved by organizing the problem and the subordinated subproblems in a tree hierarchy and optimizing each subsystem separately. Coupling of the subproblems is accounted for by subsequent optimization of the entire system based on sensitivities of the suboptimization problem solutions at each level of the tree to variables of the next higher level. A formalization of the procedure suitable for computer implementation is developed and the state of readiness of the implementation building blocks is reviewed showing that the ingredients for the development are on the shelf. The decomposition method is also shown to be compatible with the natural human organization of the design process of engineering systems. The method is also examined with respect to the trends in computer hardware and software progress to point out that its efficiency can be amplified by network computing using parallel processors. The NASA Ames Research Center proposed a man-vehicle systems research facility to support flight simulation studies which are needed for identifying and correcting the sources of human error associated with current and future air carrier operations. The organization of research facility is reviewed and functional requirements and related priorities for the facility are recommended based on a review of potentially critical operational scenarios. Requirements are included for the experimenter's simulation control and data acquisition functions, as well as for the visual field, motion, sound, computation, crew station, and intercommunications subsystems. The related issues of functional fidelity and level of simulation are addressed, and specific criteria for quantitative assessment of various aspects of fidelity are offered. Recommendations for facility integration, checkout, and staffing are included. A.R.H.

A THEORY OF HUMAN ERROR Final Report
Duane T. McRuer, Warren F. Clement, and R. Wade Allen May 1980 91 p refs
(Contract NAS2-10400)
(NASA-CR-166313; NAS 1.26:166313; STI-TR-1156-1) Avail: NTIS HC A05/MF A01 CSCL 01C

Human error, a significant contributing factor in a very high proportion of civil transport, general aviation, and rotorcraft accidents is investigated. Correction of the sources of human error requires that one attempt to reconstruct underlying and contributing causes of error from the circumstantial causes cited in official investigative reports. A validated analytical theory of the input-output behavior of human operators involving manual control, communication, supervisory, and monitoring tasks which are relevant to aviation operations is presented. This theory of behavior, both appropriate and inappropriate, provides an insightful basis for investigating, classifying, and quantifying the needed cause-effect relationships governing propagation of human error. PERFORMANCE TESTING OF A MAIN ROTOR SYSTEM FOR A UTILITY HELICOPTER AT 1/4 SCALE
John D. Berry (Army Aviation Research and Development Command, Langley, Va.) Apr. 1982 49 p refs
(DA Proj. 1L1-61102-AH-45)
(NASA-TM-83274; L-15015; NAS 1.15:83274; AVRADCOM-TR-82-B-3) Avail: NTIS HC A03/MF A01 CSCL 01C

Two rotor systems for the UH-1 helicopter were tested in hover and forward flight. The baseline system was a dynamically scaled model of the current rotor system, while the other system was designed for advanced performance. In hover out of ground effect, the advanced rotor system shows improvements up to 10 percent in the figure of merit and improvements in thrust up to 7 percent. In forward flight, the advanced rotor system demonstrated reductions in required torque throughout the range of conditions tested, with reductions up to 17 percent occurring at the higher advance ratios and higher lift values tested. T.M.

TAILOR-MADE STRUCTURES; TODAY, AND TOMORROW: NEW MATERIALS, AN EXPLORATORY INVESTIGATION INTO THEIR POTENTIAL USE
W. J. Bird 16 Apr. 1980 48 p
(BAe-SDW-85/A/104/005) Avail: NTIS HC A03/MF A01

The use of fiber/matrix combinations, e.g. in a nonmetallic airplane, is discussed. The development of fiber/matrix structures is hindered by an absence of design experience, designers whose experience is in metallics rather than textiles, the conservative structures employed, and production times for fiber components. A modular tooling system is proposed. The structural feasibility of the aircraft is established by examining the possibility of constructing VC-10 components in fiber/matrix materials. Author (ESA)

A COMPLETE METHOD FOR COMPUTATION OF BLADE MODE CHARACTERISTICS AND RESPONSES IN FORWARD FLIGHT
J. P. Lefrancq and B. Masure Paris 1981 10 p refs Presented at 7th European Rotorcraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany 8-11 Sep. 1981; sponsored by DFVLR, Cologne
(SNIAS-821-210-101) Avail: NTIS HC A02/MF A01

The model approach to rotor dynamic behavior is outlined, and an azimuth method is presented. The azimuth method applies to stabilized flights, in particular those in which rotor configuration is considered repeatable after one revolution. Excitation occurs at rotor frequency (R+F) or at multiples of it. Rotor behavior is developed in a Fourier series of which basic frequency is R+F. The series terms are considered negligible beyond the nth harmonic. Development coefficient counts show that (2n+1) successive positions (azimuths), regularly spread over the revolution, can describe rotor behavior. Accuracy depends on the number n of harmonics retained. The n number selection depends on computer capacity. Author (ESA)

CONCEPT STUDIES OF AN ADVANCED COMPOSITE HELICOPTER FIN
A. Desmonceaux and M. Torres Paris 1981 13 p Presented at the 7th European Rotorcraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany, 8-11 Sep. 1981; sponsored by DFVLR, Cologne
(SNIAS-821-210-106) Avail: NTIS HC A02/MF A01

A composite fin and fan in fin assembly was developed for the Dauphin 2. The structure is made of epoxy resin preimpregnated Kevlar or graphite, single or two direction fiber cloths. A single block construction is used in heavily loaded areas or areas stabilized through a sharp curvature. A sandwich construction with Nomex honeycomb filler is used where loads are less. Static tests and theoretical studies show that maximum thrust is increased by 40% compared with a similar weight metal structure. Production costs are reduced by eliminating a great number of parts and assemblies. Operating costs are lowered by abolishing corrosion risks and improving maintenance through the simpler design. The fail safe composites increase safety. Author (ESA)

TAIL ROTOR STUDIES FOR SATISFACTORY PERFORMANCE: STRENGTH AND DYNAMIC BEHAVIOR
G. Blachere and F. dAmbra Paris 1981 13 p refs Presented at 7th European Rotocraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany 8-11 Sep. 1981; sponsored by DFVLR, Cologne
(SNIAS-821-210-108) Avail: NTIS HC A02/MF A01

Flexbeam, teetered, cantilevered and semirigid two bladed rotors were studied in flight, on whirl test stands and theoretically. The blades are compared with conventional helicopter blades. For 2 ton helicopters, the tested blades have fewer parts, and weigh less than conventional ones. Blade life is increased, manufacturing and maintenance costs are lowered. For 8 ton helicopters, similar improvements were achieved, but at the expense of larger control forces and limited lifetime for the flexbeam. Author (ESA)

APPLICATION OF KALMAN FILTERING TO THE KINEMATIC RECONSTRUCTION OF FREE FLIGHT OF CATAPULTED AIRCRAFT MODELS IN THE LABORATORY [APPLICATION DU FILTRAGE DE KALMAN A LA RESTITUTION DE LA CINEMATIQUE DES MAQUETTES D'AVION CATAPULTEES EN VOL LIBRE EN LABORATOIRE]
P. Coton 30 Jun. 1980 15 p In FRENCH
(IMFL-80-28; IMFL-8214) Avail: NTIS HC A02/MF A01

A Kalman filtering procedure was developed in order to improve results obtained with a catapult and aircraft model. Application of this procedure is criticized. It is concluded that the procedure as it stands is unreliable. Reconfiguration of the in the NAE Airborne Simulator, a modified, variable stability Bell 205 A is described, as is the development of various control systems for use with them. The results of two experiments are presented indicating both the feasibility and acceptability of such systems for a wide variety of tasks in a conventional single rotor helicopter, with a minimum of stability augmentation. Areas of future research are indicated. Author

RESULTS OF NASA/FAA GROUND AND FLIGHT SIMULATION EXPERIMENTS CONCERNING HELICOPTER IFR AIRWORTHINESS CRITERIA
J. Victor Lebacqz, Robert T. N. Chen, Ronald M. Gerdes, Jeanine M. Weber, and Raymond D. Forrest (FAA, Moffett Field, Calif.) *In its* Helicopter Handling Qualities 1 Apr. 1982 p 121-138 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

A sequence of ground and flight simulation experiments was conducted to investigate helicopter instrument-flight-rules airworthiness criteria. The first six of these experiments and major results are summarized. Five of the experiments were conducted on large-amplitude motion base simulators. The NASA-Army V/STOLAND UH-1H variable-stability helicopter was used in the flight experiment. Artificial stability and control augmentation, longitudinal and lateral control, and in pitch and roll attitude augmentation were investigated. M.D.K.

STATE-OF-THE-ART COCKPIT DESIGN FOR THE HH-65A HELICOPTERS
Daniel E. Castleberry and Marsha Y. McElreath *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 139-143 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

In the design of a HH-65A helicopter cockpit, advanced integrated electronics systems technology was employed to achieve several important goals for this multimission aircraft. They were: (1) integrated systems operation with consistent and simplified cockpit procedures; (2) mission-task-related cockpit displays and controls, and (3) reduced pilot instrument scan effort with excellent outside visibility. The integrated avionics system was implemented to depend heavily upon distributed but complementary processing, multiplex digital bus technology, and multifunction CRT controls and displays. This avionics system was completely flight tested and will soon enter operational service with the Coast Guard. M.D.K.

PERFORMANCE EVALUATION OF A KINESTHETIC-TACTUAL DISPLAY
Richard J. Jagacinski, John M. Flach, Richard D. Gilson, and Richard S. Dunn (Army Research and Technology Lab., Moffett Field, Calif.) *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 145-150 refs

(Grant NsG-2179)
Avail: NTIS HC A11/MF A01 CSCL 01C

Simulator studies demonstrated the feasibility of using kinesthetic-tactual (KT) displays for providing collective and cyclic command information, and suggested that KT displays may increase pilot workload capability. A dual-axis laboratory tracking task suggested that beyond reduction in visual scanning, there may be additional sensory or cognitive benefits to the use of multiple sensory modalities. Single-axis laboratory tracking tasks revealed performance with a quickened KT display to be equivalent to performance with a quickened visual display for a low frequency sum-of-sinewaves input. In contrast, an unquickened KT display was inferior to an unquickened visual display. Full scale simulator studies and/or inflight testing are recommended to determine the generality of these results. Author

COCKPIT INTEGRATION FROM A PILOT'S POINT OF VIEW
David L. Green *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 171-181

Avail: NTIS HC A11/MF A01 CSCL 01C

Extensive experience in both operational and engineering test flight was used to suggest straightforward changes to helicopter cockpit and control system design that would improve pilot performance in marginal and instrument flight conditions. Needed control system improvements considered include: (1) separation of yaw from cyclic force trim; (2) pedal force proportional to displacement rate; and (3) integration of engine controls in collective stick. Display improvements needed include: (1) natural cuing of yaw rate in attitude indicator; (2) collective position indication and radar altimeter placed within primary scan; and (3) omnidirectional display of full range airspeed data. M.D.K.

INTEGRATED COCKPIT FOR A-129
Filippo Reina, James J. Gracia (Harris Government Information Systems Div.), and Bryce W. Koth (Harris Government Information Systems Div.) *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 183-192

Avail: NTIS HC A11/MF A01

Weight, size, and mission requirements for the A-129 mandated an integrated system approach for the crew/cockpit interface design. Instead of the usual multitude of cockpit controls, indicators, gauges, and lights, the primary crew interface is a single multifunction keyboard and one or more multifunction CRT display units. This cockpit design approach imposed unusual constraints upon the system architecture to overcome the inherent information access limitations of a data input/output window that was restricted by the available space. The conceptual approach and resulting design of the A-129 cockpit with the intent to enhance the development of cockpit standardization are described. Author

HELICOPTER SIMULATION TECHNOLOGY: AN AMES RESEARCH CENTER PERSPECTIVE

Richard S. Bray *In its* Helicopter Handling Qualities Apr. 1982 p 199-208 refs
Avail: NTIS HC A11/MF A01 CSCL 01C

The total experience for evidence regarding the levels of motion and visual cueing fidelity required for handling-qualities research in ground-based simulators is reviewed. Positive contributions of cockpit motion were identified, but much remains to be learned regarding the sensitivities of individual control modes to cueing attenuation. A firmer understanding of the pilot's utilization of visual and motion cues is the key to more efficient use of simulation in helicopter control-systems research. Author

A PILOT IN THE LOOP ANALYSIS OF HELICOPTER ACCELERATION/DECELERATION MANEUVERS

Robert K. Heffley *In* NASA. Ames Research Center Helicopter Handling Qualities Apr. 1982 p 221-232 refs

Avail: NTIS HC A11/MF A01 CSCL 01C

Helicopter flight acceleration/deceleration maneuvers are quantified and put to use in the fields of handling qualities, flight training and evaluation of simulator fidelity. The three specific cases include the normal speed change maneuver, the nap-of-the-Earth dash/quickstop, and the decelerating approach to hover. All of these maneuvers share common generic features in terms of pilot adaptation and mathematical description: yet each differs in terms of the essential feedback loop structure, implications for handling qualities requirements, and simulator fidelity criteria. APPLICATIONS OF SYSTEM IDENTIFICATION METHODS TO THE PREDICTION OF HELICOPTER STABILITY, CONTROL AND HANDLING CHARACTERISTICS

G. D. Padfield (RAE, Bedford, England) and R. K. DuVal *In its* Helicopter Handling Qualities Apr. 1982 p 233-247 refs

Avail: NTIS HC A11/MF A01 CSCL 01C

A set of results on rotorcraft system identification is described. Flight measurements collected on an experimental Puma helicopter are reviewed and some notable characteristics highlighted. Following a brief review of previous work in rotorcraft system identification, the results of state estimation and model structure estimation processes applied to the Puma data are presented. The results, which were obtained using NASA developed software, are compared with theoretical predictions of roll, yaw and pitching moment derivatives for a 6 degree of freedom model structure. Anomalies are reported. The theoretical methods used are described. A framework for reduced order modelling is outlined. Author

SUN SENSING GUIDANCE SYSTEM FOR HIGH ALTITUDE AIRCRAFT Patent

Robert D. Reed, Principal Investigator Issued 27 Apr. 1982 7 p Filed 12 Mar. 1980 Supersedes N80-20249 (18 - 11, p 1375)
(NASA-Case-FRC-11052-1; US-Patent-4,326,685; US-Patent-Appl-SN-129783; US-Patent-Class-244-175; US-Patent-Class-244-188; US-Patent-Class-244-190; US-Patent-Class-318-580) Avail: US Patent and Trademark Office CSCL 17G

A sun sensing guidance system for high altitude aircraft is described. The system is characterized by a disk shaped body mounted for rotation aboard the aircraft in exposed relation to solar radiation. The system also has a plurality of mutually isolated chambers: each chamber being characterized by an opening having a photosensor disposed therein and arranged in facing relation with the opening for receiving incident solar radiation and responsively providing a voltage output. Photosensors are connected in paired relation through a bridge circuit for providing heading error signals in response to detected imbalances in intensities of solar radiation.

ANALYSIS AND MONTE CARLO SIMULATION OF NEAR-TERMINAL AIRCRAFT FLIGHT PATHS

James R. Schiess and Christine G. Matthews (Computer Sciences Corp.) Apr. 1982 39 p refs
(NASA-TP-1997; L-15062; NAS 1.60:1997) Avail: NTIS HC A03/MF A01 CSCL 17G

The flight paths of arriving and departing aircraft at an airport are stochastically represented. Radar data of the aircraft movements are used to decompose the flight paths into linear and curvilinear segments. Variables which describe the segments are derived, and the best fitting probability distributions of the variables, based on a sample of flight paths, are found. Conversely, given information on the probability distribution of the variables, generation of a random sample of flight paths in a Monte Carlo simulation is discussed. Actual flight paths at Dulles International Airport are analyzed and simulated. E.L.

DETERMINATION OF WIND TUNNEL CONSTRAINT EFFECTS BY A UNIFIED PRESSURE SIGNATURE METHOD. PART 1: APPLICATIONS TO WINGED CONFIGURATIONS Final Report, Oct. 1980 - Nov. 1981

J. E. Hackett, S. Sampath, and C. G. Phillips Jun. 1981 185 p refs 2 Vol.
(Contract NAS2-9883)
(NASA-CR-166186; NAS 1.26:166186; LG81ER0166-Pt-1) Avail: NTIS HC A09/MF A01 CSCL 01C

A new, fast, non-iterative version of the 'Wall Pressure Signature Method' is described and used to determine blockage and angle-of-attack wind tunnel corrections for highly-powered jet-flap models. The correction method is complemented by the application of tangential blowing at the tunnel floor to suppress flow breakdown there, using feedback from measured floor pressures. This tangential blowing technique was substantiated by subsequent flow investigations using an LV. The basic tests on an unswept, knee-blown, jet flapped wing were supplemented to include the effects of slat-removal, sweep and the addition of unflapped tips. C sub mu values were varied from 0 to 10 free-air C sub l's in excess of 18 were measured in some cases. Application of the new methods yielded corrected data which agreed with corresponding large tunnel 'free air' resuls to within the limits of experimental accuracy in almost all cases. A program listing is provided, with sample cases. Author

DETERMINATION OF WIND TUNNEL CONSTRAINT EFFECTS BY A UNIFIED PRESSURE SIGNATURE METHOD. PART 2: APPLICATION TO JET-IN-CROSSFLOW Final Report, Oct. 1980 - Nov. 1981

J. E. Hackett, S. Sampath, C. G. Phillips Jun. 1981 186 p refs 2 Vol.
(Contract NAS2-9883)
(NASA-CR-166187; NAS 1.26:166187; LG81ER0167-Pt-2) Avail: NTIS HC A09/MF A01 CSCL 01C

The development of an improved jet-in-crossflow model for estimating wind tunnel blockage and angle-of-attack interference is described. Experiments showed that the simpler existing models fall seriously short of representing far-field flows properly. A new, vortex-source-doublet (VSD) model was therefore developed which employs curved trajectories and experimentally-based singularity strengths. The new model is consistent with existing and new experimental data and it predicts tunnel wall (i.e. far-field) pressures properly. It is implemented as a preprocessor to the wall-pressure-signature-based tunnel interference predictor. The supporting experiments and theoretical studies revealed some new results. Comparative flow field measurements with 1-inch 'free-air' and 3-inch impinging jets showed that vortex penetra-

carbon fibre reinforced plastics. Düsseldorf, VDI-Verlag GmbH, 1981, p. 151-166. Translation.

A detailed description is given of the design and construction of a carbon fiber-reinforced plastic (CRP) elevator structure for the Alpha-Jet trainer aircraft. The spar box of the elevator unit consists of two continuous CRP shells and 11 metal ribs, and the remainder of the assembly consists of CRP, or glass reinforced plastic, or a combination of the two. Attention is given to comparisons of structural complexity and production costs for the conventional metallic and CRP elevator units, laminate construction details, the stiffening of the spar box shells by means of a supporting sandwich, and preparation of the spar box for autoclaving. A weight saving of 18% has been demonstrated for the CRP structure, which in fatigue tests has exhibited a 20,000 flying hours capability. O.C.

A82-28659 **The effect of swirl burner aerodynamics on NOx formation.** T. C. Claypole and N. Syred (University College, Cardiff, Wales). In: Symposium /International/ on Combustion, 18th, Waterloo, Ontario, Canada, August 17-22, 1980, Proceedings. Pittsburgh, PA, Combustion Institute, 1981, p. 81-89. 17 refs. Research supported by the Science Research Council.

When swirl is applied to the combustion air of a burner, a complex, highly turbulent flow field is established which produces very stable flames. There is currently little information available regarding the effect of the swirl on pollutant formation. The current investigation is concerned with the influence of the levels of swirl on the aerodynamics and NOx emissions at constant load. The instantaneous velocities in the experiments are measured by dual beam laser anemometry. The flame is sampled with the aid of a quartz probe. It is found that to establish the source of pollutants in a swirl combustor, it is essential to consider the pollutant mass flow profiles. The recirculation zone, despite elevated temperatures, does not appear to play a major role in the formation of NOx. G.R.

A82-28660 **NOx formation in flat, laminar, opposed jet methane diffusion flames.** W. A. Hahn and J. O. L. Wendt (Arizona, University, Tucson, AZ). In: Symposium /International/ on Combustion, 18th, Waterloo, Ontario, Canada, August 17-22, 1980, Proceedings. Pittsburgh, PA, Combustion Institute, 1981, p. 121-129; Comments, p. 129-131. 18 refs. U.S. Environmental Protection Agency Grant No. R-803715; Contract No. 68-02-2631.

Diffusion flames can play a useful role in the study of the kinetic mechanisms of pollutant formation. A laminar diffusion flame which has a number of useful attributes is the flat laminar opposed jet diffusion flame. Such a flame is established between two coaxial opposed jets, one being fuel only and the other being oxidizer only, impinging on one other. This flame is strained in its own plane, and it can be envisioned as a prototype model for laminar flamelets in turbulent diffusion flames. It is shown that the considered flame, having a given stretching rate, is one dimensional in temperature, concentration, and axial, but not radial, velocity profiles, provided the correct boundary conditions are employed for the velocities of the two incoming jets. G.R.

A82-28692 **The combustion of a fuel jet in a stream of lean gaseous fuel-air mixtures.** G. A. Karim, I. Wierzba, M. Metwally, and K. Mohan (Calgary, University, Calgary, Alberta, Canada). In: Symposium /International/ on Combustion, 18th, Waterloo, Ontario, Canada, August 17-22, 1980, Proceedings. Pittsburgh, PA, Combustion Institute, 1981, p. 977-990; Comments, p. 990, 991. 8 refs. Research supported by the National Research Council of Canada, Imperial Oil, Ltd., and University of Calgary.

The purpose is to establish the way in which the presence of a fuel vapor homogeneously dispersed in the surrounding air influences the burning characteristics of the jet flame and the corresponding flammability limits for both co-flowing and contra-flowing surrounding streams in the presence of a pilot jet diffusion flame. A wide range of jet diameters and discharge velocities is employed involving methane or hydrogen at ambient temperature and pressure. Both laminar and turbulent co-flowing streams are considered; the streams involve a range of gaseous fuel-air mixtures and include methane, hydrogen, propane and ethylene. It is shown that the presence of very small concentrations of fuel in the surroundings of the jet flame tends to increase the flame thickness and height and to considerably enhance its stabilization. It is also found that the detected flame spread lean limit of the fuels is essentially independent of the type of jet fuel and the initial jet discharge velocity. C.R.

A82-28738 **The relaxation oscillation in ramjet combustion.** N. Huang (Beijing Institute of Aeronautics and Astronautics, Beijing, People's Republic of China). In: Symposium /International/ on Combustion, 18th, Waterloo, Ontario, Canada, August 17-22, 1980, Proceedings. Pittsburgh, PA, Combustion Institute, 1981, p. 1891-1897. 20 refs.

A mechanism of low frequency relaxation oscillation in ramjet combustion is proposed. Initial pressure disturbances induce combustion instability which results in periodic heat release. Acting as feedback, the periodic heat release boosts the pressure pulsations. The complex shock wave system separating the supersonic and subsonic flows may be replaced by a virtual normal shock which shifts back and forth in the diffuser duct in response to the pulsating pressure. The cold gas column expands or contracts like a buffer plug between the virtual normal shock and the flame front in accordance with the pulsating combustion downstream. This chain of actions and reactions results in a self-excited nonlinear relaxation oscillation with irregular frequency. The proposed mechanism explains quite well the oscillograph obtained from the rig testing of a 220 mm ramjet engine in a free jet of Mach No. 1.94 from a blowdown tunnel. (Author)

A82-28808 **Applications of structural adhesives in production.** W. J. Charles and S. J. Palmer (3M United Kingdom, Ltd., Adhesives, Coatings and Sealants Div., Swansea, Wales). In: Adhesion 5; Proceedings of the Eighteenth Annual Conference on Adhesion and Adhesives, London, England, March 1980. London, Applied Science Publishers, Ltd., 1981, p. 119-131.

A82-28826 **Instruments and installations for meteorological measurements at airports (Pribory i ustanovki dlia meteorologicheskikh izmerenii na aerodromakh).** Edited by L. P. Afinogenov and E. V. Romanov. Leningrad, Gidrometeoizdat, 1981. 296 p. In Russian.

A description is given of the systems and devices which are employed to provide the meteorological information which is needed for the conduction of the flight operations of civil aviation according to the established standards of safety, efficiency, and reliability, taking into account the meteorological conditions at the airport and its environment. Problems and organizational aspects concerning the conduction of meteorological measurements at airports are discussed, giving attention also to the accuracy requirements. The various approaches for determining visibility characteristics are examined along with the equipment employed in the measurements. The determination of wind parameters, atmospheric pressure, temperature, and humidity is also considered. A description is provided of an automatic system which was developed in 1971 for the utilization of automatic procedures in connection with the acquisition, the processing, and the distribution of meteorological data. G.R.

A82-28873 **Tool use in cutting operations involving integral structural components in aircraft construction (Werkzeugeinsatz bei der Zerspanung von Integralbauteilen im Flugzeugbau).** H. Grasmann (Messerschmitt-Bölkow-Blohm GmbH, Augsburg, West Germany). In: Cutting operations for metals (Zerspanung der Metalle). Oberursel, West Germany, Deutsche Gesellschaft für Metallkunde, 1981, p. 97-104. In German.

In connection with the desirability to use lighter and stiffer structural units in aircraft designs, integral constructional approaches have been adopted in the aircraft industry during the last few years. The change involves a replacement of a multitude of small individual sheet metal parts by a few complex integral structural components, which are obtained by suitable machining operations from forgings or plates. The materials used for the production of integral structural components include, in addition to aluminum, also titanium and high-strength steels. However, a number of problems arise in connection with the required metal-cutting operations. Problems related, in particular, to the use of titanium are solved by making use of a new cutting concept involving the use of multiple-spindle machines and special tools. Attention is given to the selection of suitable cutting tools. G.R.

A82-28875 1 **Cascade converter of dc voltage to ac voltage**

of higher frequency with voltage and frequency stabilization devices (Kaskadnyi preobrazovatel' postoiannogo napriazheniia v peremennoe povyshennoi chastoty s ustroistvami dlia stabilizatsii napriazheniia i chastoty). M. M. Krasnoshapka and I. P. Tereshkov (Vysshee Inzhenerno-Aviatsionnoe Voennoe Uchilishche VVS, Kiev, Ukrainian SSR). *Tekhnicheskaia Elektrodinamika*, Jan.-Feb. 1982, p. 59-62. In Russian.

A dc-to-ac cascade converter is presented which consists of a dc motor and an asynchronous motor with a three-phase stator winding and a multiphase rotor winding mounted on a common shaft within the same housing. The experimental converter changes 28 V dc to 200/115 V ac, 400 Hz; it has a power of 800 VA at 8000 rpm and an efficiency of 0.56. The voltage stabilization circuit includes a toroidal winding on the back of the stator, an automatic voltage regulator which controls the magnetization current of the toroidal winding, and a capacitor bank controlled by the magnetization current through a contactor. Frequency is stabilized by an automatic current regulator in the control field coil circuit. V.L.

A82-29932 A multidimensional-crack-growth prediction methodology for flaws originating at fastener holes. W. T. Fujimoto and C. R. Saff (McDonnell Aircraft Co., St. Louis, MO). (*Society for Experimental Stress Analysis, International Congress on Experimental Mechanics, 4th, Boston, MA, May 25-30, 1980*.) *Experimental Mechanics*, vol. 22, Apr. 1982, p. 139-146. 16 refs.

A general two-dimensional crack growth prediction methodology for flawed fastener holes is developed which accounts for the effects of residual stresses due to yielding at the hole edge as well as the changing shape of the flaw. The methodology is based on a slice-synthesis model of the flawed hole which predicts the stress-intensity factor distribution along the periphery of the crack after each increment of advance. Analytic predictions of crack growth rates are found to be in good agreement with test results. It is concluded that the assumption of a constant shape in one-dimensional crack growth prediction schemes can result in highly inaccurate service life estimates. V.L.

A82-29934 Utility of a probability-density-function curve and F-maps in composite-material inspection. J. L. Rose, Y. H. Jeong, and M. J. Avioli (Drexel University, Philadelphia, PA). *Experimental Mechanics*, vol. 22, Apr. 1982, p. 155-160.

The principles of probability-density-function analysis are briefly reviewed and its applications to nondestructive testing are discussed with emphasis on composite materials inspection. It is shown that probability-density-function curves can be used to produce feature maps (F-maps) of a composite material which are useful in both quality control and damage assessment. Sample problems involving graphite-polyimide structures and boron-aluminum materials are examined to illustrate the use of probability-density-function curves and F-maps. The concept of inspectability and its role in selecting a manufacturing technology are also discussed. V.L.

A82-[illegible] # Prediction of aerodynamically induced vibrations in turbomachinery blading. D. Hoyniak and S. Fleeter (Purdue University, West Lafayette, IN). In: Fluid/structure interactions in turbomachinery; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 1-8. 14 refs.

To predict the aerodynamically forced response of an airfoil, an energy balance between the unsteady aerodynamic work and the energy dissipated through the airfoil structural and aerodynamic damping is performed. Theoretical zero incidence unsteady aerodynamic coefficients are then utilized in conjunction with this energy balance technique to predict the effects of reduced frequency, inlet Mach number, cascade geometry, and interblade phase angle on the torsion mode aerodynamically forced response of the cascade. In addition, experimental unsteady aerodynamic gust data for flat plate and cambered cascaded airfoils are used together with theoretical cascade unsteady aerodynamic damping coefficients to indicate the effects of incidence angle and airfoil camber on the forced response of the airfoil cascade. A82-[illegible] * # Measurement of aerodynamic work during fan flutter. A. P. Kurkov (NASA, Lewis Research Center, Cleveland, OH). In: Fluid/structure interactions in turbomachinery; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 9-16. 12 refs. (Previously announced in STAR as N81-[illegible])

A82-[illegible] # The excitation of compressor/duct systems. H. E. Peacock (U.S. Naval Postgraduate School, Monterey, CA) and D. K. Das (Cranfield Institute of Technology, Cranfield, Beds., England). In: Fluid/structure interactions in turbomachinery; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 71-78. 8 refs. Research sponsored by the Ministry of Defence of England.

A series of experiments is reported in which the flow through a compressor/duct combination was perturbed in a cyclic way. The unsteady flows generated were mapped through the system in the regime of stable compressor operations and the variation of their magnitude evaluated. It was found that in approaching the stability limit the stagnation pressure pulses tended to be magnified and that the position of the stability limit line depended both upon the mean operating point of the compressor and the pulsation characteristics. Further, it was possible to destabilize the system in a surge type manner at any superimposed frequency. (Author)

A82-[illegible] Advanced aluminum and titanium structures; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. Meeting sponsored by the American Society of Mechanical Engineers. Edited by J. W. Goodman (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). New York, American Society of Mechanical Engineers (Aerospace Symposia Series. Volume AD-02), 1981. 47 p. Members, $7.50; nonmembers, $15.

Among the topics discussed are the use of the spot weldbonding process in A-10 aircraft production, the structural integrity of an adhesively bonded aircraft fuselage, and the superplastic forming of 7475 aluminum alloy high-strength aircraft structures. Also considered are the development of low-cost titanium alloy structures using blended elemental powder metallurgy, and the techniques of built-up, low-cost advanced titanium alloy aircraft structure manufacture. O.C.

A82-[illegible] # Production weldbonding on the A-10 aircraft. R. L. Rupp, A. Sharpe (Fairchild Republic Co., Farmingdale, NY), and S. G. Lee (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Advanced aluminum and titanium structures; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 1-10. 8 refs. Contract No. F33615-78-C-5121.

The weldbonding process - an energy conservative manufacturing process where the detail parts are fixtured by spotwelding through a structural adhesive with subsequent curing to obtain the strength and fatigue life characteristic of adhesive bonded structure - has been production implemented on the A-10. A four-phase program has been conducted to provide near-term service experience and production experience on the A-10 and to define weldbond applicability to fatigue and fracture critical primary aircraft structure and secondary structure by mechanical property and environmental durability testing. The production costs for the first 100 weldbonded shipsets are discussed with an analysis of the key cost drivers. Planned production is in excess of 2800 weldbond assemblies. (Author)

A82-[illegible] # Structural integrity of an adhesively bonded aircraft fuselage. D. L. Potter (Douglas Aircraft Co., Long Beach, CA). In: Advanced aluminum and titanium structures; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 11-17. 11 refs. USAF-sponsored research.

Procedures and test results used in the selection of a surface pretreatment and adhesive system, and methods for its nondestructive inspection, are described for the case of the Primary Adhesively Bonded Structure Technology (PABST) program. PABST is concerned with evaluating the potential cost savings, weight reductions and structural integrity improvements that may result from the

New York, American Institute of Aeronautics and Astronautics, 1982, p. 387-396. 5 refs. (AIAA 82-0719)

In this paper, the problem of the shape optimization in a fiber reinforced composite has been considered. The shape optimization can be interpreted as the problem of the optimum fiber distribution. In particular, the design of a long cylindrical rod that is subjected to torsion has been discussed. The problem has been formulated as a dual or min-max problem with appropriate constraints. The resulting Lagrange multipliers have been identified with physical parameters by performing the needed variations. The design procedure has been discussed by considering the examples of the torsion of a rod of a circular, a square and a rectangular cross section. (Author)

A82-30171 * # **Transonic flutter study of a wind-tunnel model of a supercritical wing with/without winglet.** C. L. Ruhlin (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA), F. J. Rauch, Jr., and C. Waters (Grumman Aerospace Corp., Engineering Dept., Bethpage, NY). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 407-415. 18 refs. (AIAA 82-0721)

The scaled flutter model was a 1/6.5-size, semispan version of a supercritical wing (SCW) proposed for an executive-jet-transport airplane. The model was tested cantilever-mounted with a normal wingtip, a wingtip with winglet, and a normal wingtip ballasted to simulate the winglet mass properties. Flutter and aerodynamic data were acquired at Mach numbers from 0.6 to 0.95. The measured transonic flutter speed boundary for each wingtip configuration had roughly the same shape with a minimum flutter speed near M = 0.82. The winglet addition and wingtip mass ballast decreased the wing flutter speed by about 7 and 5%, respectively; thus, the winglet effect on flutter was more a mass effect than an aerodynamic effect. Flutter characteristics calculated using a doublet-lattice analysis (which included interference effects) were in good agreement with the experimental results up to M = 0.82. Comparisons of measured static aerodynamic data with predicted data indicated that the model was aerodynamically representative of the airplane SCW. (Author)

A82-30172 # **Aeroelastic flutter and divergence of stiffness coupled, graphite/epoxy, cantilevered plates.** S. J. Hollowell (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) and J. Dugundji (MIT, Cambridge, MA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 416-426. 17 refs. Contract No. F33615-77-C-5155. (AIAA 82-0722)

An analytical and experimental investigation was conducted to determine the aeroelastic flutter and divergence behavior of unswept, rectangular wings simulated by graphite/epoxy, cantilevered plates with varying amounts of bending-torsion stiffness coupling. The analytical approach incorporated a Rayleigh-Ritz energy formulation and unsteady, incompressible two-dimensional aerodynamic theory. Flutter and divergence velocities were obtained using the V-g method and compared to results of low-speed wind tunnel tests. Stall flutter behavior was also examined experimentally. There was good agreement between analytical and experimental results. Wings with negative stiffness coupling exhibited divergence, while positive coupling delayed the onset of stall flutter. (Author)

A82-30173 # **Application of optimal control techniques to aircraft flutter suppression and load alleviation.** C. Hwang and W. S. Pi (Northrop Corp., Aircraft Div., Hawthorne, CA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 427-438. 14 refs. Contract No. F33615-80-C-3217. (AIAA 82-0724)

Optimal control techniques were applied to design the reduced order controllers for the purpose of aircraft flutter suppression and load alleviation. Special attention was given to the multiple input, multiple output (MIMO) system, to which the classical feedback control theory cannot be conveniently applied. Using the optimal control approach, a number of control laws were designed for the YF-17 flutter suppression model. The relative performances of these control laws and previously synthesized control laws were evaluated analytically. In a wind tunnel entry using the flutter suppression model, one of the newly developed control laws was mechanized and successfully demonstrated. (Author)

A82-30176 # **Flutter analysis using nonlinear aerodynamic forces.** T. Udea and E. H. Dowell (Princeton University, Princeton, NJ). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 462-481. 11 refs. Grant No. AF-AFOSR-81-0123. (AIAA 82-0728)

The nonlinear effects of transonic aerodynamic forces on the flutter boundary of a typical section airfoil are studied. The flutter speed dependence on amplitude is obtained by utilizing a novel variation of the describing function method which takes into account the first fundamental harmonic of the nonlinear oscillatory motion. By using an aerodynamic describing function, traditional flutter analysis methods may still be used while including the effects of aerodynamic nonlinearities. The aerodynamic forces are computed by the LTRAN2 aerodynamic code for NACA 64A006 and NACA 64A010 airfoils. (Author)

A82-30177 # **Feedback control of a cantilever wing in steady airflow.** L. Meirovitch and L. Silverberg (Virginia Polytechnic Institute and State University, Blacksburg, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 482-488. (AIAA 82-0729)

A method for the active flutter suppression of a cantilever wing in steady airflow is presented. The wing undergoes bending and torsional vibrations. The control forces are generated by leading-edge or trailing-edge flaps. Only the flutter modes are targetted for control, while the remaining modes are left uncontrolled. Because of inherent structural damping in the wing, however, motion in these modes decays exponentially with time. A numerical example is presented. (Author)

A82-30179 # **Component coupling with time-invariant mass matrix for nonisotropic rotating and nonrotating systems.** S. G. Sadler, J. Corrigan, and J. G. Yen (Bell Helicopter Textron, Fort Worth, TX). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 503-513. 13 refs. (AIAA 82-0731)

A method has been developed which allows a nonisotropic rotating structure to be coupled with a nonisotropic nonrotating structure such that the system's coupled equations of motion have a time-invariant mass matrix. The modeling requirements for this method are defined and the analytical approach is developed using physical degrees of freedom to describe the motions of both the rotating and the nonrotating components. Extensions to component modal synthesis methods are given for a typical component modal method, and also for a more recently developed method which retains only physical degrees of freedom at the component interfaces. The method is developed for both time-domain and frequency-domain solutions. Demonstration of the method for helicopter coupled rotor/airframe dynamic analysis including a two-bladed teetering rotor are presented. (Author)

A82-30182 * # **On the dynamic collapse of a column impacting a rigid surface.** J. M. Housner and N. F. Knight, Jr. (NASA, Langley Research Center, Structures and Dynamics Div., Hampton, VA). In: Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 2. New York, American Institute of Aeronautics and Astronautics, 1982, p. 530-541. 24 refs. (AIAA 82-0735)

Results are presented of an analytical investigation on the dynamic collapse of an elastic periodically supported column. The column has an attached mass at one end and impacts a rigid surface with prescribed velocity and angle of incidence at the other end. A first-order approximate nonlinear analysis is developed in which it is assumed that only first-order nonlinear terms need be retained.

Differential equations are derived and solved numerically by explicit time integration in order to determine specific ranges of the basic nondimensional parameters for which the response characteristics are markedly different. To assess modeling sophistication relative to prediction accuracy, a comparison is made of the results from this approximate analysis with those of a finite element computer code based on a convected coordinate formulation. C.D.

A82-30193 * # **Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method.** E. C. Yates, Jr., H. J. Cunningham, R. N. Desmarais (NASA, Langley Research Center, Hampton, VA), W. A. Silva, and B. Drobenko. *AIAA, ASME, ASCE, and AHS, Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, AIAA Paper 82-0727.* 20 p. 20 refs.

Several applications of the steady, oscillatory, and unsteady subsonic and supersonic aerodynamics (SOUSSA) computer program to wings with steady and oscillatory motion, including flutter, are discussed. The program employs a generalized Green's function to the full, time-dependent potential-flow equation to obtain an integral equation for the velocity potential at any point in a flow, even points on a body or whole bodies in a flow. Aerodynamic calculations are provided for two rectangular wings, a clipped-tip delta wing, and two swept wings with and without a fuselage. The number and distribution of the finite element panels are varied in order to demonstrate the convergence of the results. The results are shown to be close to those of lifting-surface theory, and further applications with bodies having deformities, arbitrary shapes, motions, and deformations are indicated. M.S.K.

A82-30294 **A giant step toward composite helicopters.** M. M. Schwartz and G. Jacaruso (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Machinist,* Mar. 1982, p. 133-140.

The design goals and performance achievements of the UH60A Black Hawk helicopter Composite Rear Fuselage (CRF) structure's development are described, with emphasis on the use of computer-assisted interactive design techniques and on the fabrication and assembly methods used to produce this graphite-reinforced epoxy structure, which is 6 ft high, 8 ft wide, and 9 ft long. The metallic form of the rear fuselage is composed of 1203 parts, divided into 88 assemblies, with 17,000 fasteners. By contrast, the CRF comprises 459 detail parts, 23 assemblies and less than 6000 fasteners. Weight savings of 10% and manufacturing cost reductions of 30% have been demonstrated. Attention is given to the cutting and kitting of prepreg details, their preforming and pre-layup, frame and bulkhead fabrication, and the fabrication of the upper-center skin assembly. O.C.

A82-30311 **Improvements to secondary radar for air traffic control.** R. C. Bowes (Royal Signals and Radar Establishment, Malvern, Worcs., England). *Journal of Navigation,* vol. 35, May 1982, p. 193-204. Research supported by the Civil Aviation Authority.

The civil use of secondary surveillance radar (SSR), which is the prime sensor for the control of the aircraft, is described. The use of SSR in air-traffic control is detailed, and comparisons with primary radar are made. The prevention of sidelobe interrogations and the processing of SSR replies are explained. The two main types of problems with SSR, self-interference effects and reflected signals, are discussed. Additional topics of discussion are monopulse direction finding, which enables an accurate azimuth measurement to be obtained from a single reply, and selective address SSR, which helps solve the SSR garble problem. C.D.

A82-30312 **The reliability of height and identity data.** H. Gent (Royal Signals and Radar Establishment, Malvern, Worcs., England). *Journal of Navigation,* vol. 35, May 1982, p. 204-219. Research sponsored by the Civil Aviation Authority.

The nature and extent of secondary surveillance radar (SSR) errors are discussed with a description of the Mode A and Mode C codes, and a concrete example of error is given. Investigation shows that short-period Mode C and Mode A errors are equally likely, each occurring in about 1 plot in 5000, with neither airborne nor ground equipment being wholly responsible. Pulse error counts are made for both modes, and a comparison with garble shows that while the latter occurs more frequently, it can be anticipated while data errors cannot. Examples of persistent as opposed to short-period errors are also discussed, with the two types for Mode C showing very similar behavior. The airborne equipment was found to be at fault in all errors that cannot be explained as simple pulse code errors. The introduction of Mode S will reduce the incidence of data errors. C.D.

A82-30313 **Secondary radar for airborne collision avoidance.** S. Ratcliffe. *Journal of Navigation,* vol. 35, May 1982, p. 220-239. 14 refs.

Cooperative collision avoidance systems, passive beacon collision avoidance systems (BCAS), and active radar systems are discussed for civil aviation. The detection of collision risk is treated mathematically. The trajectory of a possible threat as plotted in the range/range rate phase plane is discussed, and the range/range-rate logic is quantitatively studied. Parameters are given for the sensitivity levels at which BCAS is operative. The use of height and height-rate data is described, and the operation of the collision avoidance system is analyzed. Finally, the resolution advisory register, which ensures compatibility between BCAS advisories, is discussed. C.D.

A82-30314 **Magnetic anomalies as a reference for ground-speed and map-matching navigation.** C. Tyren. *Journal of Navigation,* vol. 35, May 1982, p. 242-254.

The use of the earth's magnetic field for ground referenced motion and position measurements is discussed. A magnetic terrain-navigation concept is set forth, and its sensor configuration, data processing and data storage unit, and navigation data interface unit are discussed. The navigational accuracy of the system is assessed; one particular advantage of terrain navigation systems is that ground-speed accuracy is independent of vehicle speed until speeds are reached at which the sensors and/or computer operations are too slow to track the vehicle path. The system is therefore excellent at low speeds and can advantageously be used for hovering operations. The results of field tests indicate that the feasibility of both ground-speed and map-matching methods is indeed promising. C.D.

A82-30675 **Aviation gear drives and reducers: Handbook (Aviatsionnye zubchatye peredachi i reduktory: Spravochnik).** Edited by E. B. Vulgakov. Moscow, Izdatel'stvo Mashinostroenie, 1981. 376 p. In Russian.

The book contains data on the geometry, kinematics, design, manufacture, and testing of aviation gear drives and reducers. In particular, consideration is given to the geometrical analysis of involute cylindrical gear drives, gear drive strength and dynamics, splined joints, analysis of torsional and flexural vibrations, and computer-aided design of gear drives. Other topics discussed include materials, chemical and heat treatment, tolerances, and quality assurance during the manufacture of gears, experimental testing techniques, and principal defects. Attention is also given to the design of helicopter reduction gears, overrunning clutches, lubricants for reduction gears, and cost-effectiveness of gear manufacture. V.L.

A82-30697 † **Gas turbine engines used in aviation: Design and construction of components /5th revised and enlarged edition/ (Aviatsionnye gazoturbinnye dvigateli: Konstruktsiia i raschet detalei /5th revised and enlarged edition/).** G. S. Skubachevskii. Moscow, Izdatel'stvo Mashinostroenie, 1981. 552 p. 113 refs. In Russian.

The principles underlying the design of gas turbine engines are expounded. The operating conditions of the various engine compartments, and parts thereof, are considered. Attention is also given to manufacturing processes and the proper choice of materials. Examples of calculations for determining the strength and vibration of the principal engine components are included. C.R.

A82-31048 **Chem-Braze abradable seal practical.** M. Levy (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA). *ManTech Journal,* vol. 6, no. 2, 1981, p. 9-12. Army-supported research.

An improved Chem-Braze bonding system for attaching sintered abradable seals to titanium, steel, and nickel base compressor blade tip shrouds has been developed. The system incorporates glycerin to prevent premature evaporation which prolongs working life and allows adequate time to attach abradable seals to engine hardware. The system has demonstrated its viability with attachment involving simple mechanical fixturing and curing and removal facilitiated by chemical stripping, and all operations are relatively fast and filtering system is recommended. A protocol of tests intended to determine acceptable performance of the system is presented. Author (ESA)

CONTROLS AND DISPLAYS FOR ALL-WEATHER OPERATION OF HELICOPTERS

R. D. vonReth 3 Apr. 1981 19 p refs
(MBB-UD-319-81-O) Avail: NTIS HC A02/MF A01

Various mission requirements for all weather operations are reviewed. In particular some of the most important features for military applications are outlined. Some of the basic relations between increasing display sophistication and increasing control sophistication are discussed. Also the influence of various functions on the degree of control automation as it seems desirable for future systems under the aspect of man machine interaction are taken into consideration. The controls and displays arrangement of some representative helicopters of presently operational helicopters are described. An outline of the goals and results of some experimental and research programs is given. The characteristics of presently operational helicopters are compared with the technologically feasible solutions taking into account some of the economic constraints as initial cost, operational cost and reliability. In an outlook at the future some basic requirements for the controls and the displays operation are established. J.M.S.

ADVANCED GENERAL AVIATION COMPARATIVE ENGINE/AIRFRAME INTEGRATION STUDY Final Report, Jan. 1980 - Sep. 1981

George L. Huggins and David R. Ellis Sep. 1981 133 p refs
(Contract NAS3-22221)
(NASA-CR-165564; NAS 1.26:165564; Cessna-AD-217) Avail: NTIS HC A07/MF A01 CSCL 21E

The NASA Advanced Aviation Comparative Engine/Airframe Integration Study was initiated to help determine which of four promising concepts for new general aviation engines for the 1990's should be considered for further research funding. The engine concepts included rotary, diesel, spark ignition, and turboprop powerplants; a conventional state-of-the-art piston engine was used as a baseline for the comparison. Computer simulations of the performance of single and twin engine pressurized aircraft designs were used to determine how the various characteristics of each engine interacted in the design process. Comparisons were made of how each engine performed relative to the others when integrated into an airframe and required to fly a transportation mission. Author

(NASA-CR-165459; NAS 1.26:165459; PWA-5594-164) Avail: NTIS HC A09/MF A01 CSCL 21E

An exhaust mixer test program was conducted to define the technology required for the Energy Efficient Engine Program. The model configurations of 1/10 scale were tested in two phases. A parametric study of mixer design options, the impact of residual low pressure turbine swirl, and integration of the mixer with the structural pylon of the nacelle were investigated. The improvement of the mixer itself was also studied. Nozzle performance characteristics were obtained along with exit profiles and oil smear photographs. The sensitivity of nozzle performance to tailpipe length, lobe number, mixer penetration, and mixer modifications like scalloping and cutbacks were established. Residual turbine swirl was found detrimental to exhaust system performance and the low pressure turbine system for Energy Efficient Engine was designed so that no swirl would enter the mixer. The impact of mixer/plug gap was also established, along with importance of scalloping, cutbacks, hoods, and plug angles on high penetration mixers. M.D.K.

ADVANCED LOW-EMISSIONS CATALYTIC-COMBUSTOR PROGRAM, PHASE 1 Final Report

G. J. Sturgess Jun. 1981 158 p refs
(Contract NAS3-20821)
(NASA-CR-159656; NAS 1.26:159656; PWA-5589-19; ESL-TR-79-23) Avail: NTIS HC A08/MF A01 CSCL 21E

Six catalytic combustor concepts were defined, analyzed, and evaluated. Major design considerations included low emissions, performance, safety, durability, installations, operations and development. On the basis of these considerations the two most promising concepts were selected. Refined analysis and preliminary design work was conducted on these two concepts. The selected concepts were required to fit within the combustor chamber dimensions of the reference engine. This is achieved by using a dump diffuser discharging into a plenum chamber between the compressor discharge and the turbine inlet, with the combustors overlaying the prediffuser and the rear of the compressor. To enhance maintainability, the outer combustor case for each concept is designed to translate forward for accessibility to the catalytic reactor, liners and high pressure turbine area. The catalytic reactor is self-contained with air-cooled canning on a resilient mounting. Both selected concepts employed integrated engine-starting approaches to raise the catalytic reactor up to operating conditions. Advanced liner schemes are used to minimize required cooling air. The two selected concepts respectively employ fuel-rich initial thermal reaction followed by rapid quench and subsequent fuel-lean catalytic reaction of carbon monoxide, and, fuel-lean thermal reaction of some fuel in a continuously operating pilot combustor with fuel-lean catalytic reaction of remaining fuel in a radially-staged main combustor. INVESTIGATION OF SOOT AND CARBON FORMATION IN SMALL GAS TURBINE COMBUSTORS Final Report

T. J. Rosfjord Apr. 1982 54 p refs
(Contract NAS3-22524)
(NASA-CR-167853; NAS 1.26:167853; UTRC-R82-915387-16) Avail: NTIS HC A04/MF A01 CSCL 21E

An investigation of hardware configurations which attempt to minimize carbon and soot-production without sacrificing performance in small gas turbine combustors was conducted. Four fuel injectors, employing either airblast atomization, pressure atomization, or fuel vaporization techniques were combined with nozzle air swirlers and injector sheaths. Eight configurations were screened at sea-level takeoff and idle test conditions. Selected configurations were focused upon in an attempt to quantify the influence of combustor pressure, inlet temperature, primary zone operation, and combustor loading on soot and carbon formation. Cycle tests were also performed. It was found that smoke emission levels depended on the combustor fluid mechanics, the atomization quality of the injector and the fuel hydrogen content. R.J.F.

ADVANCED GENERAL AVIATION ENGINE/AIRFRAME INTEGRATION STUDY

Leon A. Zmroczek Mar. 1982 131 p refs
(Contract NAS3-22220)
(NASA-CR-165565; NAS 1.26:165565) Avail: NTIS HC A07/MF A01 CSCL 21E

A comparison of the in-airframe performance and efficiency of the advanced engine concepts is presented. The results indicate that the proposed advanced engines can significantly improve the performance and economy of general aviation airplanes. The engine found to be most promising is the highly advanced version of a rotary combustion (Wankel) engine. The low weight and fuel consumption of this engine, as well as its small size, make it suited for aircraft use. T.M.

PERFORMANCE OF SINGLE-STAGE AXIAL-FLOW TRANSONIC COMPRESSOR WITH ROTOR AND STATOR ASPECT RATIOS OF 1.63 AND 1.77, RESPECTIVELY, AND WITH DESIGN PRESSURE RATIO OF 2.05

Royce D. Moore and Lonnie Reid Apr. 1982 115 p refs
(NASA-TP-2001; E-334; NAS 1.60:2001) Avail: NTIS HC A06/MF A01 CSCL 21E

The overall and blade-element performance of a transonic compressor stage is presented over the stable operating range for speeds from 50 to 100 percent of design. The stage was designed for a pressure ratio of 2.05 at a flow of 20.2 kg/sec and a tip speed of 455 m/sec. At design speed the rotor and stage achieved peak efficiencies of 0.849 and 0.831, respectively, at the minimum flow condition. The stage stall point occurred at a flow higher than the design flow. RB211 POWERPLANT DETERIORATION: REVIEW OF CURRENT SITUATION AND LESSONS LEARNED

Alec G. Collins 1981 5 p
(PNR-90073) Avail: NTIS HC A02/MF A01

The need for high temperatures in the engine cycle of gas turbine aircraft engines was demonstrated; the effects of thermal barrier coatings (TBC) on component life, cooling air requirements, and turbine entry temperature (TET) are discussed. Experience with the RB211, Olympus 593, and Pegasus engines illustrates the usefulness of TBCs consisting of zirconia based ceramics with nickel or cobalt bond coats. Life improvements > 50% are directly attributable to TBCs on combustor walls, vaporizing fuel injectors, and discharge nozzles. Airfoil coatings survive 150 hr RB211-524 tests at higher than normal TET. Author (ESA)

DEVELOPMENT OF A CORRELATED FINITE ELEMENT DYNAMIC MODEL OF A COMPLETE AERO ENGINE

R. A. Bellamy, J. C. Bennett, and S. T. Elston 1981 10 p refs
(PNR-90081) Copyright. Avail: NTIS HC A02/MF A01

The accuracy of the dynamic model of the RB211 engine and nacelle was tested. Modal descriptions of load/deflection behavior, natural frequencies, and mode shapes were compared with shake tests and modal analyses. Modal analysis was carried out by a frequency response analyzer which used an incremental sine technique and a minicomputer based system that input a random signal to the shaker, operating on transducer measurements with a software Fourier transform in order to achieve the frequency response functions. Correlation between the results is excellent. Author (ESA)

PARAMETRIC STUDY OF THE INFLUENCE OF THE ENGINE UPON THE OPERATING COST OF A CIVIL HELICOPTER

Gilbert Baclac, Jean-Pierre Dedieu, and Philippe Cabrit Paris 1981 6 p Presented at 7th European Rotorcraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany, 8-11 Sep. 1981; sponsored by DFVLR, Cologne
(SNIAS-827-210-102) Avail: NTIS HC A02/MF A01

The influence of engine characteristics (weight, fuel consumption, price, power range) upon helicopter operating cost was studied. The parametric relationship between gross weight, weight of airframe with one or two turbine engines, engine weight, and fuel weight was defined. An 860 hp engine was made more powerful by increasing turbine inlet temperature through the cooling of the high pressure turbine and by increasing pressure ratio. Analysis shows that a sufficient power reserve is necessary, but too high a value penalizes operating cost. This confirms the interest of having a super emergency rating on civil helicopter engines. Low fuel consumption should be the result of a compromise with level of complexity since high complexity increases the engine cost and can reduce reliability. Simultaneous evolution of aircraft and engine increases cost effectiveness. Author (ESA)

N82-22274# Rolls-Royce Ltd., Derby (England).

ENCOUNTERS WITH SURGE: SOME EXPERIENCES OF DEVELOPMENT OF AXIAL COMPRESSORS FOR AERO GAS TURBINES

A. B. McKenzie Mar. 1981 35 p
(PNR-90071) Avail: NTIS HC A03/MF A01

Rolls Royce jet engine development is traced. The Avon was the first. Its design pressure ratio is 6.15, corresponding to a design temperature rise of 20 C per stage in each of 12 stages. The first stage entry diameter ratio is 0.5, lower than contemporary compressors. In the Avon RA14, surge, precipitated when a number of stages stalled, was eliminated by progressively increasing the stagger of the last six rotor blade rows by 1 deg to 6 deg. In the Conway, a bypass provides a permanent bleed from the low pressure compressor. The bleed becomes an increasing proportion of total flow as speed is reduced. This eliminates surge problems when the engine is throttled back at high forward speed. In the Tyne, the removal of the hub section permits a higher surge pressure ratio. In the RB211, a handling bleed with a variable input is placed between the compressors. Author (ESA)

N82-22275# Rolls-Royce Ltd., Derby (England).

RELIABLE POWER

J. M. S. Keen Feb. 1981 21 p Presented at Intern. Aircraft Maintenance Eng. Exhibition and Conf., Zurich, Feb. 1981
(PNR-90078) Avail: NTIS HC A02/MF A01

The Rolls Royce RB211 engine design is reviewed. The three shaft concept increases engine thrust and cuts fuel consumption. The highest thrust version of the RB211 cuts fuel consumption of Boeing 747's by 17%. The 535E4 blends turbine and bypass flows in a buried nozzle within a longer cowl. The resultant gases are exhausted through a single final nozzle. This device provides an automatic rematching of the engine cycle at climb ratings, thereby saving fuel and reducing turbine entry temperature. Reverse thrust is increased by up to 30% relative to an unmixed engine. The on-condition maintenance policy reduces costs without reducing safety. The reliability management program ensures the most cost effective maintenance schedule. Author (ESA)

N82-22276# Rolls-Royce Ltd., Derby (England).

FUEL EFFICIENCY ENGINES FOR LARGE TRANSPORT AIRCRAFT

D. J. Parfitt 27 Mar. 1981 27 p Presented at Aeron. Soc. of India Conf., Bombay, 27 Mar. 1981
(PNR-90082; MISC-555) Avail: NTIS HC A03/MF A01

The next generation of Rolls Royce aircraft engines is discussed, especially their fuel consumption. For the RB211, improvements on the order of 10% in fuel consumption relative to the initial service standard are planned. Large fan engines are expected to remain technology leaders in the long-term. Fuel savings on the order of 10% to 15% are feasible, using low specific thrust designs. Noise and exhaust emission improvements are predicted. Advanced wing designs and the use of lightweight composite materials, linked with full authority digital control systems, enhance engine performance. Liquid hydrogen is suggested as a replacement for kerosene, because of its high heating value. Author (ESA)

N82-22277# Rolls-Royce Ltd., Derby (England).

COLLABORATIVE DEVELOPMENT OF AERO-ENGINES

G. M. Lewis 1981 9 p
(PNR-90083) Avail: NTIS HC A02/MF A01

European cooperation in aircraft engine development is described, using the Olympus and RB199 projects as examples. The management structure was based on the integration of existing teams in the partner companies. Author (ESA) tion into the flow, in diameters, was almost unaltered until 'hard' impingement occurred. In modeling impinging cases, a 'plume redirection' term was introduced which is apparently absent in previous models. The effects of this term were found to be very significant. Author

COMPARISON OF ANALYTICAL PREDICTIONS OF LONGITUDINAL SHORT PERIOD PILOT-INDUCED OSCILLATIONS WITH RESULTS FROM A SIMULATION STUDY OF THE SPACE SHUTTLE ORBITER

Donald R. Riley and G. Kimball Miller, Jr. Apr. 1982 43 p refs
(NASA-TM-83267; L-14847; NAS 1.15:83267) Avail: NTIS HC A03/MF A01 CSCL 01C

An analytical analysis of conditions producing pilot induced oscillations (PIO's) was made for the space shuttle orbiter in a landing approach configuration for the task of milling the elevation angle of the line of sight to a target vehicle. The analysis yielded a value of PIO frequency and a value for the amount of total system time delay (pilot + control system) that can be tolerated before instability results. Calculations were performed showing the effect of varying the range to the target and of varying the handling qualities of the orbiter vehicle. Analytical predictions were compared with simulation results obtained using a visual motion simulator. Author

VALIDATION OF ZERO-ORDER FEEDBACK STRATEGIES FOR MEDIUM RANGE AIR-TO-AIR INTERCEPTION IN A HORIZONTAL PLANE

Josef Shinar Apr. 1982 48 p refs
(NASA-TM-84237; NAS 1.15:84237; A-8895) Avail: NTIS HC A03/MF A01 CSCL 01C

A zero order feedback solution of a variable speed interception game between two aircraft in the horizontal plane, obtained by using the method of forced singular perturbation (FSP), is compared with the exact open loop solution. The comparison indicates that for initial distances of separation larger than eight turning radii of the evader, the accuracy of the feedback approximation is better than one percent. The result validates the zero order FSP approximation for medium range air combat analysis. S.L.

AUTOMATED DESIGN OF MINIMUM DRAG LIGHT AIRCRAFT FUSELAGES AND NACELLES Final Report

Frederick O. Smetana, Star R. Fox, and Baruch E. Karlin 14 May 1982 25 p refs
(Grant NsG-1584)
(NASA-CR-168913; NAS 1.26:168913) Avail: NTIS HC A02/MF A01 CSCL 01C

The constrained minimization algorithm of Vanderplaats is applied to the problem of designing minimum drag faired bodies such as fuselages and nacelles. Body drag is computed by a variation of the Hess-Smith code. This variation includes a boundary layer computation. The encased payload provides arbitrary geometric constraints, specified a priori by the designer, below which the fairing cannot shrink. The optimization may include engine cooling air flows entering and exhausting through specific port locations on the body. M.D.K.

TRANSONIC FLUTTER STUDY OF A WIND-TUNNEL MODEL OF A SUPERCRITICAL WING WITH/WITHOUT WINGLET

Charles L. Ruhlin, Frank J. Rauch, Jr., and Catherine Waters Mar. 1982 11 p refs Presented at the 23rd AIAA/ASME/ASCE/AHS Struct., Structural Dyn. and Mater. Conf., New Orlean, 10-12 May 1982 Prepared in cooperation with Grumman Aerospace Corp., Bethpage, N.Y.
(NASA-TM-83279; NAS 1.15:83279) Avail: NTIS HC A02/MF A01 CSCL 01C

The model was a 1/6.5-size, semipan version of a wing proposed for an executive-jet-transport airplane. The model was tested with a normal wingtip, a wingtip with winglet, and a normal wingtip ballasted to simulate the winglet mass properties. Flutter and aerodynamic data were acquired at Mach numbers (M) from 0.6 to 0.95. The measured transonic flutter speed boundary for each wingtip configuration had roughly the same shape with a minimum flutter speed near M = 0.82. The winglet addition and wingtip mass ballast decreased the wing flutter speed by about 7 and 5 percent, respectively; thus, the winglet effect on flutter was more a mass effect than an aerodynamic effect. T.M.

EVALUATION OF FOUR SUBCRITICAL RESPONSE METHODS FOR ON-LINE PREDICTION FLUTTER ONSET IN WIND-TUNNEL TESTS

Charles L. Ruhlin, Judith J. Watson, Rodney H. Ricketts, and Robert V. Doggett, Jr. Mar. 1982 10 p refs Presented at the AIAA/ASME/ASCE/AHS 23rd Struct., Structural Dyn. and Mater. Conf., New Orleans, 10-12 May 1982
(NASA-TM-83278; NAS 1.15:83278;
AIAA-PAPER-82-0644CP) Avail: NTIS HC A02/MF A01 CSCL 01C

The methods were evaluated for use in tests where the flutter model is excited solely by airstream turbulence. The methods were: randomdec, power-spectral-density, peak-hold, and cross-spectrum. The test procedure was to maintain a constant Mach number (M) and increase the dynamic pressure (q) in incremental steps. The test Mach numbers were 0.65, 0.75, 0.82, 0.90, and 1.15. The four methods provided damping trends by which the flutter mode could be tracked and extrapolated to a flutter-onset q. A hard flutter point was obtained at M = 0.82. The peak-hold and cross-spectrum methods gave reliable results and could be most readily used for on-line testing. At M = 0.82, a p-k analysis predicted the same flutter mode as the experiment but a 6-percent lower flutter q. At the subcritical dynamic pressures, calculated damping values were appreciably lower than measured data. T.M.

COMPUTER MODELING OF FAN-EXIT-SPLITTER SPACING EFFECTS ON F100 RESPONSE TO DISTORTION Final Report
M. Shaw and R. W. Murdoch Mar. 1982 115 p refs
(Contract NAS3-22739)
(NASA-CR-167879; NAS 1.26:167879; FR-15596) Avail: NTIS HC A06/MF A01 CSCL 21E

The distortion response of the F100(3) engine was effected by the fan exit splitter configuration. The sensitivity for a proximate splitter fan is calculated to be slightly greater than a remote splitter configuration with identical airfoils. Predicted response was based upon a multiple segment parallel compressor Model modified to include a bypass ratio representation that effects the performance characteristics of the last rotor and intermediate case struts. The predicted distortion response required an accurate definition of row pre- and post-stall undistorted operation. Author

ANALYSIS OF HIGH LOAD DAMPERS Final Report
S. T. Bhat, D. F. Buono, and D. H. Hibner 21 Aug. 1981 79 p refs
(Contract NAS3-22518)
(NASA-CR-165503; NAS 1.26:165503; PWA-5779-10) Avail: NTIS HC A05/MF A01 CSCL 21E

High load damping requirements for modern jet engines are discussed. The design of damping systems which could satisfy these requirements is also discussed. In order to evaluate high load damping requirements, engines in three major classes were studied: large transport engines, small general aviation engines, and military engines. Four damper concepts applicable to these engines were evaluated: multi-ring, cartridge, curved beam, and viscous/friction. The most promising damper concept was selected for each engine and performance was assessed relative to conventional dampers and in light of projected damping requirements for advanced jet engines. S.W.

ADVANCED TURBINE STUDY Final Report, Aug. 1980 - Dec. 1981
12 Apr. 1982 94 p
(Contract NAS8-33821)
(NASA-CR-162003; NAS 1.26:162003; FR-15978) Avail: NTIS HC A05/MF A01 CSCL 21E

Experiments to determine the available increase in turbine horsepower achieved by increasing turbine inlet temperature over a range of 1800 to 2800 R, while applying current gas turbine airfoil cling technology are discussed. Four cases of rocket turbine operating conditions were investigated. Two of the cases used O2/H2 propellant, one with a fuel flowrate of 160 pps, the other 80 pps. Two cases used O2/CH4 propellant, each having different fuel flowrates, pressure ratios, and inlet pressures. Film cooling was found to be the required scheme for these rocket turbine applications because of the high heat flux environments. Conventional convective or impingement cooling, used in jet engines, is inadequate in a rocket turbine environment because of the resulting high temperature gradients in the airfoil wall, causing high strains and low cyclic life. The hydrogen-rich turbine environment experienced a loss, or no gain, in delivered horsepower as turbine inlet temperature was increased at constant airfoil life. The effects of film cooling with regard to reduced flow available for turbine work, dilution of mainstream gas temperature and cooling reentry losses, offset the relatively low specific work capability of hydrogen when increasing turbine inlet temperature over the 1800 to 2800 R range. However, the methane-rich environment experienced an increase in delivered horsepower as turbine inlet temperature was increased at constant airfoil life. The results of a materials survey and heat transfer and durability analysis are discussed. M.G.

Processing and uses of carbon fibre reinforced plastics --- Book
A82-28643
Elevator unit for the Alpha-Jet, made from carbon-fibre reinforced plastic
A82-28649
High temperature, short term tensile strength of C6000/PMR-15 graphite polyimide
[AIAA 82-0711] A82-30125
Service life investigation of a sailplane wing of CFRP construction
N82-22324

CASCADE CONTROL
Cascade converter of dc voltage to ac voltage of higher frequency with voltage and frequency stabilization devices --- aircraft electric equipment
A82-28875

CASCADE FLOW
Prediction of aerodynamically induced vibrations in turbomachinery blading
A82-28986

CATALYTIC ACTIVITY
Advanced Low-Emissions Catalytic-Combustor Program, phase 1 --- aircraft gas turbine engines
[NASA-CR-159656] N82-22265

CATASTROPHE THEORY
Application of the theory of bifurcations to the study of the loss of control in combat aircraft
N82-22198

CATHODE RAY TUBES
Integrated cockpit for A-129
N82-23225

CAVITIES
A multidimensional-crack-growth prediction methodology for flaws originating at fastener holes
A82-28932

CEMENTS
Pavement management and rehabilitation of portland cement concrete pavements
[PB82-131384] N82-22392

CENTER OF MASS
The maximum flying range problem for an aircraft
A82-31602

CERAMIC COATINGS
The contribution of thermal barrier coatings to improvements in the life and performance of gas turbine components
[PNR-90076] N82-22271

CERAMICS
New materials fly better and cheaper
A82-31426

CERTIFICATION
737 graphite-epoxy horizontal stabilizer certification
[AIAA 82-0745] A82-30109
Civil (French/US) certification of the Coast Guard's HH-65A Dauphin
N82-23210

CESSNA 172 AIRCRAFT
Development of a simple, self-contained flight test data acquisition system
[NASA-CR-168912] N82-23245

CHROMIUM COMPOUNDS
An evaluation study of aluminide and chromoaluminide coatings on IN-100
A82-29597

CIVIL AVIATION
The micro revolution comes to civil air transport
A82-29259
Developmental possibilities in civil aviation in the Federal Republic of Germany
N82-22230
Socata: TB 20 Trinidad given German debut
[NASA-TM-76706] N82-22247
The 1983 NASA Authorization, Volume 1
[GPO-91-488-VOL-1] N82-23068
Civil (French/US) certification of the Coast Guard's HH-65A Dauphin
N82-23210

CLIMBING FLIGHT
Determination of an optimal control program for an aircraft power plant during climb
A82-29845

COANDA EFFECT
Aerodynamic characteristics of the external USB powered lift system using side fences for enhancement of Coanda flow attachment
[NAL-TR-686T] N82-22212

COCKPITS
Flight simulators
A82-29924
Enhanced piloting control through cockpit facilities and A.C.T.
N82-22195
Helicopter Handling Qualities
[NASA-CP-2219] N82-23208
State-of-the-art cockpit design for the HH-65A helicopters
N82-23220
Synthesis of an integrated cockpit management system
N82-23222
The role of voice technology in advanced helicopter cockpits
N82-23223
Cockpit integration from a pilot's point of view
N82-23224
Integrated cockpit for A-129
N82-23225
Helicopter simulation technology: An Ames Research Center perspective
N82-23227

COLLAPSE
Damage tolerant design using collapse techniques
[AIAA 82-0710] A82-30168
On the dynamic collapse of a column impacting a rigid surface
[AIAA 82-0735] A82-30182

COLLISION AVOIDANCE
Improvements to secondary radar for air traffic control
A82-30311
Secondary radar for airborne collision avoidance
A82-30313

COLOR CODING
Application of computer generated color graphic techniques to the processing and display of three dimensional fluid dynamic data --- for turbofan mixer nozzle mixing process analysis
A82-29008

COLUMNS (SUPPORTS)

On the dynamic collapse of a column impacting a rigid surface
[AIAA 82-0735] A82-30182

COMBAT

Combat training imagery
A82-31179

Combat Aircraft Manoeuvrability
[AGARD-CP-319] N82-22187

Review of practical experience on combat aircraft maneuverability
N82-22189

The assessment of aircraft combat effectiveness using a new computational method
N82-22203

Evaluation of direct force mode fighters by combat simulation
N82-22204

The study of combat aircraft maneuverability by air to air combat simulation
N82-22205

Influence of maneuverability on helicopter combat effectiveness
N82-23212

Validation of zero-order feedback strategies for medium range air-to-air interception in a horizontal plane
[NASA-TM-84237] N82-23237

COMBUSTION CHAMBERS

Advanced Low-Emissions Catalytic-Combustor Program, phase 1 --- aircraft gas turbine engines
[NASA-CR-159656] N82-22265

Investigation of soot and carbon formation in small gas turbine combustors
[NASA-CR-167853] N82-22267

COMBUSTION PHYSICS

The combustion of a fuel jet in a stream of lean gaseous fuel-air mixtures
A82-28692

COMBUSTION PRODUCTS

NOx formation in flat, laminar, opposed jet methane diffusion flames
A82-28660

Investigation of soot and carbon formation in small gas turbine combustors
[NASA-CR-167853] N82-22267

COMBUSTION STABILITY

The relaxation oscillation in ramjet combustion
A82-28738

COMMAND AND CONTROL

Sea-based remotely piloted vehicles. I - Issues and concepts
A82-29714

COMMERCIAL AIRCRAFT

Test methodology for evaluation of fireworthy aircraft seat cushions
A82-29596

Calculation of the contributions of air traffic and road traffic to air pollution in the region of Schiphol airport in 1574
[NLR-TR-77100-U] N82-22808

COMMUNICATION EQUIPMENT

Sea-based remotely piloted vehicles. I - Issues and concepts
A82-29714

Special investigation report: Evacuation of United Airlines DC-8-61, Sky Harbor International Airport, Phoenix, Arizona, December 29, 1980
[PB82-115619] N82-22236

COMPOSITE MATERIALS

Processing and uses of carbon fibre reinforced plastics --- Book
A82-28643

Utility of a probability-density-function curve and F-maps in composite-material inspection
A82-28934

Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1 - Structures and materials. Part 2 - Structural dynamics and design engineering
A82-30076

Flight qualification of composite structures at AMD-BA
[AIAA 82-0755] A82-30116

Environmental and high strain rate effects on composites for engine applications
[AIAA 82-0758] A82-30118

Design considerations and experiences in the use of composite material for an aeroelastic research wing
[AIAA 82-0670] A82-30146

New materials fly better and cheaper
A82-31426

COMPOSITE STRUCTURES

Composite bonds improve thermal integrity
A82-30004

A giant step toward composite helicopters
A82-30294

La Recherche Aerospatiale, bi-monthly Bulletin number 1981-5, September - October 1981 --- aerospace R and D methodology and instrumentation
[ESA-TT-725] N82-22145

Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-165841] N82-22316

COMPRESSOR EFFICIENCY

Encounters with surge: Some experiences of development of axial compressors for aero gas turbines
[PNR-90071] N82-22274

COMPRESSOR ROTORS

Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.77, respectively, and with design pressure ratio of 2.05
[NASA-TP-2001] N82-22269

COMPUTATIONAL FLUID DYNAMICS

The relaxation oscillation in ramjet combustion
A82-28738

A Schwarz-Christoffel method for generating internal flow grids
A82-29005

Computational aerodynamics - Its coming of age and its future
A82-29773

COMPUTER AIDED DESIGN

Computational aerodynamics - Its coming of age and its future
A82-29773

Design principles of a computer-aided design system
A82-29629

Integrated structural analysis and design support for advanced launch vehicles
[AIAA 82-0675] A82-30144

A giant step toward composite helicopters
A82-30294

COMPUTER GRAPHICS

Application of computer generated color graphic techniques to the processing and display of three dimensional fluid dynamic data --- for turbofan mixer nozzle mixing process analysis
A82-29008

Combat training imagery
A82-31179

COMPUTER PROGRAMMING

Transient measurements under electric pulse excitation in 37 Viggen aircraft
[FOA-C-30243-A3] N82-23409

COMPUTER PROGRAMS

The micro revolution comes to civil air transport
A82-29259

A computerized system for the application of fracture tracking data to aircraft management for the C-5A military airlift transport
[AIAA 82-0760] A82-30119

Comparison between computations and experimental data in unsteady three-dimensional transonic aerodynamics, including aeroelastic applications
[AIAA 82-0690] A82-30157

Bird impact analysis package for turbine engine fan blades
[AIAA 82-0696] A82-30162

Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method
[AIAA PAPER 82-0727] A82-30193

Program for narrow-band analysis of aircraft flyover noise using ensemble averaging techniques
[NASA-CR-165867] N82-22949

Analysis of computing system configurations for highly integrated guidance and control systems
N82-23189

A numerical investigation of two-dimensional, subsonic, linear, wind tunnel interference theory
[ARL/AERO-NOTE-403] N82-23197

Influence of maneuverability on helicopter combat effectiveness
N82-23212

Unified results of several analytical and experimental studies of helicopter handling qualities in visual terrain flight
N82-23215

New development in flying qualities with application to rotary wing aircraft
N82-23226

A pilot in the loop analysis of helicopter acceleration/deceleration maneuvers
N82-23229

HELICOPTER TAIL ROTORS
A complete method for computation of blade mode characteristics and responses in forward flight
[SNIAS-821-210-101] N82-22254
Concept studies of an advanced composite helicopter fin
[SNIAS-821-210-106] N82-22257
Tail rotor studies for satisfactory performance: Strength and dynamic behavior
[SNIAS-821-210-108] N82-22258

HELICOPTERS
Turbulence-excited flapping motion of a rotor blade in hovering flight
A82-29042
The employment of helicopters in Austria in connection with large-scale fires in buildings
A82-29585
Dynamic Environmental Qualification Techniques --- conference
[AGARD-CP-318] N82-22154
Maintenance problems in gas turbine components at the Royal Naval Aircraft Yard, Fleetlands --- helicopter and marine gas turbines
N82-22175
Conceptual design study of a visual system for a rotorcraft simulator and some advances in platform motion utilization
[NASA-CR-166322] N82-22244
RADIAN simulator for aircraft instruments
[FOA-C-40136-A3] N82-22286

HELIPORTS
Airfield visual aids research at the Royal Aircraft Establishment
[RAE-TM-FS-431] N82-22242

HELMET MOUNTED DISPLAYS
Definition of display/control requirements for assault transport night/adverse weather capability
N82-23217

HIGH ALTITUDE
Sun sensing guidance system for high altitude aircraft
[NASA-CASE-FRC-11052-1] N82-23231

HIGH SPEED
NASA/AA Advanced Rotorcraft Technology and Tilt Rotor Workshop. Volume 6: Vehicle Configuration Session
[NASA-TM-84180] N82-23242

HIGH STRENGTH ALLOYS
SPF of high strength aluminum structures --- superplastic forming for complex aircraft structures
A82-28997

HIGH STRENGTH STEELS
Comparison of reliability, sensitivity and accuracy of some NDI-Techniques
[NLR-MP-80039-U] N82-23542

HIGH TEMPERATURE TESTS
High temperature, short term tensile strength of C6000/PMR-15 graphite polyimide
[AIAA 82-0711] A82-30125

HIGHWAYS
Pavement management and rehabilitation of portland cement concrete pavements
[PB82-131384] N82-22392

HINGES
Analysis of a multihinged empennage with allowance for shear strain
A82-29834

HISTORIES
The Royal Aircraft Establishment: 100 years of research
[RAE-TM-FS-432] N82-22144
Historical perspectives on thermostructural research at the NACA Langley Aeronautical Laboratory from 1948 to 1958
N82-23494

HONEYCOMB STRUCTURES
Bonded aluminum honeycomb - Aircraft flight surface primary structure application
[AIAA 82-0676] A82-30145
Concept studies of an advanced composite helicopter fin
[SNIAS-821-210-106] N82-22257

HORIZONTAL FLIGHT
A complete method for computation of blade mode characteristics and responses in forward flight
[SNIAS-821-210-101] N82-22254
Validation of zero-order feedback strategies for medium range air-to-air interception in a horizontal plane
[NASA-TM-84237] N82-23237

HORIZONTAL TAIL SURFACES
737 graphite-epoxy horizontal stabilizer certification
[AIAA 82-0745] A82-30109

HORN ANTENNAS
Research and development at MBB. Technical and scientific publications, 1981
N82-23137

HOT PRESSING
Repair and regeneration of turbine blades, vanes and discs
N82-22185

HOT SURFACES
Powder metallurgical innovations for improved hot section alloys in aero-engine applications
[PNR-90072] N82-22358

HOVERING
Performance testing of a main rotor system for a utility helicopter at 1/4 scale
[NASA-TM-83274] N82-22251
Some aspects of jet dynamics and their implications for VTOL research
N82-23151
Jet effects on forces and moments of a VSTOL fighter type aircraft
N82-23168

HOVERING STABILITY
Turbulence-excited flapping motion of a rotor blade in hovering flight
A82-29042
An analysis of a nonlinear instability in the implementation of a VTOL control system
[NASA-TM-84220] N82-22281

HUMAN BEHAVIOR
A theory of human error
[NASA-CR-166313] N82-22250

HUMAN FACTORS ENGINEERING
Technical approaches for measurement of human errors
[NASA-CR-166314] N82-22249
A theory of human error
[NASA-CR-166313] N82-22250
Controls and displays for all-weather operation of helicopters
[MBB-UD-319-81-O] N82-22260

HUMAN PERFORMANCE
Functional requirements for the man-vehicle systems research facility --- identifying and correcting human errors during flight simulation
[NASA-CR-166315] N82-22248

HUMAN TOLERANCES
Comparing the relationships between noise level and annoyance in different surveys - A railway noise vs. aircraft and road traffic comparison
A82-29165

HYDRAULIC CONTROL
An electronic control for an electrohydraulic active control landing gear for the F-4 aircraft
[NASA-CR-3552] N82-22252

HYDROCARBON COMBUSTION
NOx formation in flat, laminar, opposed jet methane diffusion flames
A82-28660

I

IMAGE PROCESSING
Combat training imagery
A82-31179

IMPACT DAMAGE
Bird impact analysis package for turbine engine fan blades
[AIAA 82-0696] A82-30162

IMPACT LOADS
  On the dynamic collapse of a column impacting a rigid surface
    [AIAA 82-0735] A82-30182
IMPACT RESISTANCE
  Commercial jet transport crashworthiness
    [NASA-CR-165849] N82-23207
INERTIAL NAVIGATION
  Strapdown inertial navigation systems: An algorithm for attitude and navigation computations
    [ARL/SYS-REPT-23] N82-22241
  Optimal inertial navigation using terrain correlation: An attractive solution to the ground attack aircraft navigation problem
    N82-23104
INFRARED PHOTOGRAPHY
  Fighting forest fires with the aid of aircraft in the United States of America
    A82-29577
INFRARED RADIATION
  A light helicopter for night firing
    [SNIAS-821-210-105] N82-22256
INJECTORS
  Theoretical optimisation and experimental verification of an injector
    N82-23170
INLET FLOW
  The excitation of compressor/duct systems
    A82-28993
INLET NOZZLES
  Aerodynamic analysis of VTOL inlets and definition of a short, blowing-lip inlet
    [NASA-CR-165617] N82-22211
INLET PRESSURE
  Computer modeling of fan-exit-splitter spacing effects on F100 response to distortion
    [NASA-CR-167879] N82-23246
INLET TEMPERATURE
  Computer modeling of fan-exit-splitter spacing effects on F100 response to distortion
    [NASA-CR-167879] N82-23246
INSPECTION
  Utility of a probability-density-function curve and F-maps in composite-material inspection
    A82-28934
  A computerized system for the application of fracture tracking data to aircraft management for the C-5A military airlift transport
    [AIAA 82-0760] A82-30119
  Comparison of reliability, sensitivity and accuracy of some NDI-Techniques
    [NLR-MP-80039-U] N82-23542
INSTRUMENT ERRORS
  The reliability of height and identity data --- secondary surveillance radar error analysis
    A82-30312
  Magnetic anomalies as a reference for ground-speed and map-matching navigation
    A82-30314
INTERNATIONAL COOPERATION
  The investigation of aircraft accidents and incidents - Some recent national and international developments
    A82-29275
  Collaborative development of aero-engines
    [PNR-90083] N82-22277
INTERNATIONAL LAW
  The investigation of aircraft accidents and incidents - Some recent national and international developments
    A82-29275
INVERTED CONVERTERS (DC TO AC)
  Cascade converter of dc voltage to ac voltage of higher frequency with voltage and frequency stabilization devices --- aircraft electric equipment
    A82-28875

J

JET AIRCRAFT
  Commercial jet transport crashworthiness
    [NASA-CR-165849] N82-23207
JET AIRCRAFT NOISE
  Program for narrow-band analysis of aircraft flyover noise using ensemble averaging techniques
    [NASA-CR-165867] N82-22949
  Acoustic emission from free jets --- supersonic jets
    N82-22962
  Prediction of flyover jet noise spectra from static tests
    N82-22963
JET ENGINE FUELS
  The combustion of a fuel jet in a stream of lean gaseous fuel-air mixtures
    A82-28692
JET ENGINES
  Encounters with surge: Some experiences of development of axial compressors for aero gas turbines
    [PNR-90071] N82-22274
  Alternatives for jet engine control
    [NASA-CR-168894] N82-23247
JET EXHAUST
  An experimental and theoretical investigation of the interaction between the engine jet and the surrounding flow field with regard to the pressure drag on afterbodies
    N82-23158
JET FLAPS
  Aerodynamic noise generated by jet-wing/flap interactions of the external USB configuration of STOL aircraft. Part 1: Eight percent scale cold-flow model analysis
    [NAL-TR-685T] N82-22953
JET FLOW
  The role of coherent structures in the generation of noise for subsonic jets
    [NASA-CR-168764] N82-22947
  Aerodynamic noise generated by jet-wing/flap interactions of the external USB configuration of STOL aircraft. Part 1: Eight percent scale cold-flow model analysis
    [NAL-TR-685T] N82-22953
  Fluid dynamics of jets with applications to V/STOL
    [AGARD-CP-308] N82-23150
  Some aspects of jet dynamics and their implications for VTOL research
    N82-23151
  An experimental and theoretical investigation of the interaction between the engine jet and the surrounding flow field with regard to the pressure drag on afterbodies
    N82-23158
  Flowfield and noise sources of jet impingement of flaps and ground surface
    N82-23163
  Jet effects on forces and moments of a VSTOL fighter type aircraft
    N82-23168
  Theoretical optimisation and experimental verification of an injector
    N82-23170
  Determination of wind tunnel constraint effects by a unified pressure signature method. Part 2: Application to jet-in-crossflow
    [NASA-CR-166187] N82-23235
JET IMPINGEMENT
  Fluid dynamics of jets with applications to V/STOL
    [AGARD-CP-308] N82-23150
  Flowfield and noise sources of jet impingement of flaps and ground surface
    N82-23163
JET LIFT
  Evaluation of the effects of model scale and test technique on jet-induced effects
    N82-23167
JET MIXING FLOW
  Numerical study of vibrational relaxation in the turbulent mixing of jets in a supersonic nozzle
    A82-29880
  Fluid dynamics of jets with applications to V/STOL
    [AGARD-CP-308] N82-23150
  Some aspects of jet dynamics and their implications for VTOL research
    N82-23151
  Unsteady ejectors
    N82-23171
JET PROPULSION
  Thrust augmenting ejectors: A review of the application of jet mechanics to V/STOL aircraft propulsion
    N82-23169
JET THRUST
  Reliable power --- RB211 aircraft engines
    [PNR-90076] N82-22275
  Experimental study of a jet deflector
    N82-23173

Experimental investigation of turbine endwall heat
transfer. Volume 3: Data base system
[AD-A110334] N82-21201

YOUNG, L. R.
Study and design of high G augmentation devices
for flight simulators
[AD-A109127] N82-20195

Z

ZELLER, J.
The role of modern control theory in the design of
controls for aircraft turbine engines
[AIAA PAPER 82-0320] A82-26526

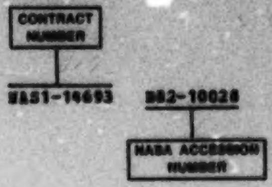
ZINCONE, R.
The future of helicopter flight control technology
A82-26821

ZIEBBS, W. L.
Development of a preloaded hybrid advanced
composite wing pivot fairing
A82-27131

ZOSIMOV, A. V.
Suppression of self-oscillations in open wind
tunnels
A82-25794

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

application of recently developed environment-resistant, 250 F-cure modified epoxy adhesives and their primers. NDI-detected adhesive flaws in the full-scale demonstration component structure, destructively exposed after completion of the test program, showed precise correlation with the Fokker Bondtester Model 70. It is also found that metal crack propagation is contained within the stiffened boundaries of pressurized panels. The damage tolerance and durability of bonded primary structures are shown to be superior to those of mechanically-fastened structures despite the fabrication quality latitude permitted by the PABST program. O.C.

A82-28997 # **SPF of high strength aluminum structures.** F. T. McQuilkin (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA), C. H. Hamilton (Rockwell International Science Center, Thousand Oaks, CA), and J. Waldman (U.S. Army, Research and Development Command, Dover, NJ). In: Advanced aluminum and titanium structures; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 19-25.

The aluminum alloy 7475 has been shown to exhibit excellent superplastic properties upon thermomechanical processing, allowing the one-step production of complex structures otherwise realizable only through the use of many parts and fasteners. After reviewing the results of tests characterizing elongation as a function of temperature and strain rate, and corresponding measurements of flow stress as a function of strain rate, over the temperature range of 371-516 C, the strain rate sensitivity exponent was determined as a function of temperature strain rate for the selection of optimum forming parameters. The 7475 alloy was then applied to the production of a redesigned T-39 Saberliner forward fuselage bulkhead consisting of a single, complex-formed sheet with four small clips, by contrast to 18 parts and over 100 rivets in conventional form, demonstrating a 36% cost reduction and 22% weight saving. O.C.

A82-28998 # **Development of low-cost titanium structures using blended elemental powder metallurgy.** P. C. Eloff (Imperial Clevite Technology Center, Cleveland, OH). In: Advanced aluminum and titanium structures; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 27-31. Research supported by Gould, Inc., United Technologies Corp., and Magnavox Government and Industrial Electronics Co.

By using blends of titanium sponge fine powder and elemental or masteralloy powders, powder metallurgy techniques have demonstrated a halving of materials costs by comparison with conventional wrought titanium alloy hardware production. An additional advantage of powder metallurgy in the working of the titanium alloy family in question, which is difficult to machine, is the ability to produce near-net shapes requiring little subsequent machining. The two structural components by which these capabilities are demonstrated are a compressor-stator connecting link for the F-100 turbofan engine, and a warhead body for the Army Stinger ground-to-air missile. The alloy compositions used are Ti-6Al-4V and Ti-6Al-6V-2Sn, respectively. It is suggested that it may be possible to formulate alloys through powder blending which would not be obtainable by means of conventional ingot metallurgy. O.C.

A82-29000 # **Advanced technology DFCS control panel for the L-1011-500.** T. E. Foster (Rockwell International Corp., Collins Air Transport Div., Cedar Rapids, IA). *American Institute of Aeronautics and Astronautics and Institute of Electrical and Electronics Engineers, Digital Avionics Systems Conference, 4th, St. Louis, MO, Nov. 17-19, 1981, AIAA Paper 81-2240.* 8 p.

The design features and development are described of a digital glareshield panel for the digital FCS-240 system that achieves the following design objectives: (1) an efficient interface with the digital FCC's; (2) improved mean time between failures; (3) required aircraft wiring; (4) improved monitoring and fault isolation features; (5) accommodation of new operational features; (6) increased flexibility for configuration changes. Besides providing traditional functions, the panel contains these advanced technology features: gas discharge displays, multifunctional displays, ARINC 429 interfaces, microprocessor control, dual redundant design, monitoring and fault isolation, human factor design, and growth and flexibility accommodation. C.D.

A82-29005 # **A Schwarz-Christoffel method for generating internal flow grids.** K. P. Sridhar (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT) and R. T. Davis (Cincinnati, University, Cincinnati, OH). In: Computers in flow predictions and fluid dynamics experiments; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 35-44. 17 refs.

A new coordinate generation technique, developed by Davis for external flows, is extended to allow for accurate grid generation for a variety of complex internal flow configurations. The approach is based on numerical integration of the Schwarz-Christoffel transformation for polygonal surfaces. It is shown to be second-order accurate with mesh size due to analytic treatment of boundary singularities. The method is flexible enough to allow for treatment of severe internal geometries, for a high degree of control of mesh spacing, and for generation of either orthogonal or nonorthogonal grids. In addition, this technique directly provides the two-dimensional incompressible potential flow solution for internal flows, as well as a simple expression for calculating the grid metric coefficients. Sample cases include symmetric and asymmetric channel, diffuser, and cascade flows. (Author)

A82-29008 * # **Application of computer generated color graphic techniques to the processing and display of three dimensional fluid dynamic data.** B. H. Anderson, C. W. Putt, and C. C. Giamati (NASA, Lewis Research Center, Cleveland, OH). In: Computers in flow predictions and fluid dynamics experiments; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 65-72. 12 refs.
(Previously announced in STAR as N81-29782)

A82-29016 # **A computer-controlled oscillation mechanism for unsteady aerodynamics experiments.** J. P. Retelle (U.S. Air Force Academy, Colorado Springs, CO), M. S. Francis (USAF, Office of Scientific Research, Bolling AFB, Washington, DC), and J. E. Keesee (USAF, Ballistic Missile Office, Norton AFB, CA). In: Computers in flow predictions and fluid dynamics experiments; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 213-218. 5 refs.

Numerous wind tunnel studies of airfoil dynamic stall have been limited to harmonic model oscillations, but new microcomputers and hybrid servo systems have now been exploited to produce a mechanism which provides a high degree of flexibility in achieving arbitrary model motions in multiple degrees of freedom over a wide range of motion alternatives. An apparatus capable of providing simultaneous motions of an airfoil or wing model in both pitch and translation has been designed and fabricated. Drive motors provide independent motion in two axes under control of servo-translator units which respond to pulse trains generated by a microcomputer using analog position and feedback loops to smooth the pulses. Programs are developed in a higher-level language using a larger disk-based computer system with subsequent downline loading of the program task image through a network communications link to the smaller computer. In addition to a description of the experimental apparatus, the various elements of motion control, including servo-translator dynamic characteristics, software techniques for pulse train generation, and required computer interface circuitry, are discussed. System performance characteristics are also discussed. (Author)

A82-29032 # **Fatigue behavior of adhesively bonded joints.** W. B. Jones, Jr. (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and J. Romanko (General Dynamics Corp., Fort Worth, TX). In: 1981 advances in aerospace structures and materials; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 61-65. 5 refs. Contract No. F33615-76-C-5220.

Adhesively bonded metal aircraft structural joints are multicomponent systems, and as such, may display complex fatigue behaviors over the range of loads and environments typically experienced in service. In order to explore the fatigue behavior of the adhesive layer itself, thick-adherend lap-shear joints were fabricated, stress analyzed, and tested. Stress distributions in the adhesive layer were calculated using a finite element program. Instrumented fatigue tests were conducted at several loads, frequencies, humidities and temperatures. Some of these tests were interrupted, and the metal had been chem milled away. Only specimens which had experienced unduly high load amplitudes displayed damage. The damage initiated in the (calculated) high stress regions as interface cracks with scrim plane crazing. The cracks grew, with concurrent reduction in joint stiffness, until cohesive failure occured in the scrim plane. The adhesive material tested is surprisingly tough and resistant to fatigue crack growth. (Author)

A82-29036 # Effects of moisture on the mechanical properties of glass/epoxy composites. C. D. Douglas and E. R. Pattie (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA). In: 1981 advances in aerospace structures and materials; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 91-97. 11 refs.

Data are presented showing the effects of moisture on the mechanical properties of a specific glass/epoxy composite system that is a candidate material for fabrication of Army composite helicopter rotor blades. The test specimens were immersed in distilled water at temperatures of 25, 40, 60, and 80 C. Immersion times were one week, one, two, three, six, and nine months, and one year. Tension testing was then done on an Instron floor-model machine at a contant crosshead speed of 0.127 cm/min, and the tangent modulus was determined. Specimen strength was found to decrease by 60 percent at 80 C immersion, less at lower temperatures. The modulus dropped about 50 percent at 80 C immersion for 90 deg off-axis specimens, less for those that were less off-axis. A coupling agent with high-fiber, low-resin content was found to be superior to other couplers. C.D.

A82-29042 # Turbulence-excited flapping motion of a rotor blade in hovering flight. Y. K. Lin (Illinois, University, Urbana, IL) and C. Y. R. Hong. In: 1981 advances in aerospace structures and materials; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981. New York, American Society of Mechanical Engineers, 1981, p. 149-153. 10 refs. Grant No. DAAG29-78-G-0039.

Statistical properties of a randomly vibrating rotor blade under the excitation of turbulence is investigated using a simple model which consists of a rigid blade, centrally hinged, with elastic restraint for the flapping motion. It is shown that turbulence affects the blade motion in two ways, distinguished by two types of terms in the equation of motion. The first type appears in the coefficients, thus causing the dynamic system to change randomly with time. The second type appears among the inhomogeneous terms. A theoretical procedure is proposed in which both effects of the turbulence can be accounted for. Application of the methodology is illustrated by numerical examples. (Author)

A82-29088 * Addition polyimide adhesives containing various end groups. A. K. Saint Clair and T. L. Saint Clair (NASA, Langley Research Center, Hampton, VA). *Polymer Engineering and Science*, vol. 22, no. 1, Jan. 1982, p. 9-14. 11 refs.

Addition polyimide oligomers have been synthesized from 3,3 prime, 4,4 prime-benzophenone tetracarboxylic acid dianhydride and 3,3 prime-methylenedianiline using a variety of latent crosslinking groups as end-caps. The nominal 1300 molecular weight imide prepolymers were isolated and characterized for solubility in amide, chlorinated and ether solvents, melt-flow and cure properties, glass transition temperature, and thermal stability on heating in an air atmosphere. Adhesive strengths of the polyimides were obtained both at ambient and elevated temperatures before and after aging at 232 C. Properties of the novel addition polyimides were compared to a known nadic end-capped adhesive, LARC-13. (Author)

A82-29185 * Comparing the relationships between noise level and annoyance in different surveys - A railway noise vs. aircraft and road traffic comparison. J. M. Fields (NASA, Langley Research Center, Hampton, VA; Southampton, University, Southampton, England) and J. G. Walker (Southampton University, Southampton, England). *Journal of Sound and Vibration*, vol. 81, Mar. 8, 1982, p. 51-80. 24 refs. Research supported by the British Railways Board; Science Research Council of England Grant No. B/RG/3777/3.

Annoyance expressed in a railway noise survey is compared with that from two road traffic and three aircraft surveys in order to determine whether responses to various types of environmental noise are source-specific. Railway noise is found to be less annoying than other noises at any given high noise level. Railway noise annoyance rises less rapidly with increasing noise level. At high levels, this gap in reactions averages about 10 dB; it ranges from 4 dB to more than 20 dB. The methods used for comparing the surveys are examined. It is found that methodological uncertainties lead to imprecise comparisons and that different annoyance scales yield different estimates of intersurvey differences. C.R.

A82-29254 Low cost aircrew training devices. M. A. G. Knight (RAF Support Command, Brampton, Cumb., England). *Aeronautical Journal*, vol. 86, Mar. 1982, p. 96-101. 5 refs.

A description is presented of the simple aids that may be used in the elementary stages of aircrew training, and illustrations are given of their integration with flight simulators and aircraft to constitute a systematic approach to flight training. The techniques described include books and manuals, two-dimensional trainers, cardboard cockpits, cutaway trainers, table top trainers, cockpit procedures and instruments trainers, computer-based trainers, videogames and video discs. Attention is given to computer-assisted instruction, in which a microcomputer assumes many of the functions of an instructor and a low-cost graphics terminal takes the role of a more complex and dynamic simulator display. O.C.

A82-29255 The micro revolution comes to civil air transport. M. Ryland (British Airways, Heathrow Airport, Middx., England). *Aeronautical Journal*, vol. 86, Mar. 1982, p. 102-108.

A presentation is made of the range of microprocessor applications currently available on civil aircraft, the hardware technology on which these applications are based is reviewed, and the software disciplines and certification procedures pertinent to airborne digital computers are outlined. Attention is given to the application of microcomputer-based systems in the B 767 new-generation airliner, which include flight control computers, flight management computer systems, CRT flight instrumentation, thrust management, air data computation, supervisory engine control, radio navigation and communication equipment control, and electrical generation regulation. It is shown that most problems encountered in applying microcomputers to civil aircraft are software-related. O.C.

A82-29368 A review of U.S. Air Force research related to airframe and engine materials. A. H. Rosenstein (USAF, Office of Scientific Research, Bolling AFB, Washington, DC). *Journal of Metals*, vol. 34, Mar. 1982, p. 14-23. 18 refs. USAF-sponsored research.

It is noted that the research addresses the fundamental physical nature of solids most directly relating to mechanical and thermal behavior. This involves an understanding of strengthening mechanisms, fatigue, plasticity, creep, fracture, shock loading, the effect of stress state, the kinetics of phase transformations, lattice imperfections, and the thermal dependence of properties. An important result of this research is information that will lead to improved structural alloys of aluminum, titanium, and nickel and to a thorough understanding of the scientific principles governing their properties and behavior. C.R.

A82-29375 The investigation of aircraft accidents and incidents - Some recent national and international developments. A. van Wijk (KLM Royal Dutch Airlines, Schiphol Airport, Netherlands). *Zeitschrift fur Luft- und Weltraumrecht*, vol. 31, Mar. 1982, p. 29-65. 75 refs.

In June 1981, an International Civil Aviation Organization (ICAO) Panel of Experts on the General Work Programme of the ICAO Legal Committee recommended that the subject 'Legal Implications of Aircraft Accident and Incident Investigation' deserved consideration as a possible new item to be added to the General Programme of the Legal Committee and that a [illegible] inexpensive. Optimum inhibitor concentration was found to be 10 percent. Optimum drying time, cure cycle, proper chemical stripping technique, and inexpensive tooling techniques were also determined. A preliminary cost analysis shows a 74 percent saving compared to attachment with gold-nickel braze. C.D.

A82-31057 **Aircraft cabin air ozone contamination and compliance with regulations.** J. F. Leach, G. R. Robinson (British Aerospace Public Ltd., Co., Filton, Avon, England), and F. J. Sandalls (Atomic Energy Research Establishment, Environmental and Medical Sciences Div., Didcot, Oxon, England). *Atmospheric Environment,* vol. 16, no. 5, 1982, p. 1021-1026. 9 refs. Research supported by the Department of Transport/Department of the Environment and Department of Industry.

Fifteen cabin air ozone measurements made in Concorde are ranked in order and plotted as log-normal and extreme value cumulative probability distributions. It is shown that the log-normal distribution gives adequate accuracy for regulatory purposes and one-sided tolerance limits may be used for statistical methods of compliance with any regulatory limit. Similarly it is shown that compliance by ozone destruction ratio may be difficult due to the extreme stratification of ozone in the lower stratosphere. (Author)

A82-31121 # **Optimal control and estimation for strapdown seeker guidance of tactical missiles.** P. L. Vergez and J. R. McClendon (USAF, Armament Laboratory, Eglin AFB, FL). *Journal of Guidance, Control, and Dynamics,* vol. 5, May-June 1982, p. 225, 226.

An extended Kalman filter is developed that explicitly accounts for the major error sources in a strapdown system and estimates the state information required by an advanced guidance system. The selected guidance law is derived from linear quadratic Gaussian theory, the only assumption being that the missile has instantaneous response and complete control over its acceleration. The filter processes the noise from the strapdown seeker and estimates the information needed by the guidance law referenced to the missile's body-fixed coordinate system. A detailed six-degree-of-freedom simulation of a generic bank-to-turn short range air-to-air missile was used to evaluate the guidance and estimation algorithm developed for the study. C.D.

A82-31125 * # **Comment on 'Optimal control via mathematical programming'.** L. J. Wood (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Journal of Guidance, Control, and Dynamics,* vol. 5, May-June 1982, p. 318, 319; Authors' Reply, p. 319. 16 refs. Contract No. NAS7-100.

A82-31179 **Combat training imagery.** *Flight International,* vol. 121, Apr. 24, 1982, p. 1048-1050.

The CT-5 is a computer-generated image (CGI) using raster scan that provides a daylight system design for sophisticated military applications. The imagery includes a formation of F-16s, a CH-46 helicopter, a KC-135, and a sea data-base. Backgrounds are realistically depicted. The CT-5 uses a PDP-11 general-purpose minicomputer connected to the simulator computer and image processor, which consists of the viewpoint processor and the channel processor. There is also a series of display processors, and scanline computation is replaced by area computation. Extra channels and more display processors can be added. C.D.

A82-31290 **The helicopter Navstar GPS test program.** R. D. Till (FAA, Technical Center, Washington, DC). *Vertiflite,* vol. 28, May-June 1982, p. 22-25.

The use of the Navstar Global Positioning System (GPS) for helicopter navigation is reviewed. The GPS system has a space segment with a contingent of 18-24 satellites in 12 hr circular orbits with 2 hr coverage by four satellites over selected areas, a user segment with a receiver/processer, and a control segment composed of four monitor stations. Ephemeris data on satellite location is relayed through the control segments to a Master Control station at Vandenberg AFB. The use of four satellites involves the solution of four equations for three-dimensional requirements and for the user clock bias. Civilian use is thus far limited to a coarse/acquisition code at a signal level of -133 dB. A total of 17 flight hours of tests with civilian craft have been flown to test the system, with the helicopter tests covering the total system cross track error, the flight technical error, and the along track error. Operational status is scheduled for 1984. M.S.K.

A82-31426 # **New materials fly better and cheaper.** *Mechanical Engineering,* vol. 104, May 1982, p. 20-26.

The types of advanced, high-performance fibers and their advantages are described, and the process of forming composites is outlined. The use of composites in present and future commercial and military aircraft, including the Learfan 2100 and the Space Shuttle Discovery, is discussed. Special attention is given to metallic and ceramic materials of the future. C.D.

A82-31602 † **The maximum flying range problem for an aircraft (O zadache poleta letatel'nogo apparata na maksimal'nuiu dal'nost').** V. I. Borzov and T. R. Igonina. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Tverdogo Tela,* Mar.-Apr. 1982, p. 20-24. 5 refs. In Russian.

The maximum flying range problem is examined in terms of the motion of the center of mass of an aircraft in a vertical plane. By using methods based on the theory of differential equations with singular perturbations, the maximum flying range problem is reduced to that of solving a boundary-value problem. The applicability of the proposed model is investigated, and the particular case of the maximum flying range in gliding is examined. V.L.

A82-31603 † **Stability and self-oscillations of coaxial rotors (Ob ustoichivosti i avtokolebaniiakh soosnykh rotorov).** E. L. Pozniak. *Akademiia Nauk SSSR, Izvestiia, Mikhanika Tverdogo Tela,* Mar.-Apr. 1982, p. 38-45. 9 refs. In Russian.

An analysis is presented of the stability and stable self-oscillations induced by viscosity-type nonconservative forces in the material of the shaft in a system of two coaxial rotors supported by a rigid damped frame. The range of stability is studied as a function of the rotor velocities and directions and as a function of damping in the bearings of the frame. A quasi-Galerkin method is used to determine frequencies, amplitudes, and modes for single-frequency as well as multifrequency self-oscillations. The stability of the obtained solutions is investigated. B.J.

A82-31643 † **Effect of operating life on the mechanical properties of the materials and load-bearing capacity of the rotor elements of gas-turbine engines (Vliianie ekspluatatsionnoi narabotki na mekhanicheskie svoistva materialov i nesushchuiu sposobnost' elementov rotorov GTD).** V. L. Akhremenko (Akademiia Nauk Ukrainskoi SSR, Institut Problem Prochnosti, Kiev, Ukrainian SSR). *Problemy Prochnosti,* Apr. 1982, p. 53-55. 5 refs. In Russian.

Experiments have been conducted to investigate changes in the mechanical properties of turbine alloys EI698, EI961, EI437BUVD, and AL4 following long-term service under actual operating conditions. It is found that ductility and impact toughness are most sensitive to damage, whereas the load-bearing capacity of gas-turbine rotors changes insignificantly in the course of service life and, therefore, cannot be used as a damage criterion. V.L.

A82-31669 **Distributed airborne array concepts.** B. D. Steinberg (Pennsylvania, University, Philadelphia, PA) and E. Yadin (Interspec, Inc., Philadelphia, PA). *IEEE Transactions on Aerospace and Electronic Systems,* vol. AES-18, Mar. 1982, p. 219-227. 19 refs. Grant No. AF-AFOSR-78-3688.

The improvement in SNR and detection range due to distributing an antenna array throughout the airframe and skin of an aircraft is examined. SNR formulas for three system configurations are presented and compared with that of a conventional, monostatic radar. Examples given in the paper show detection range increases as large as a factor of 4. Three additional potential advantages of the distributed array are an increase in spatial signal processing capability, an improvement in azimuthal resolution, and a potential reduction in transmitter power for fixed radar performance so as to reduce the probability of intercept. (Author)

N82-22144# Royal Aircraft Establishment, Farnborough (England).

THE ROYAL AIRCRAFT ESTABLISHMENT: 100 YEARS OF RESEARCH

A. J. Smith 2 Oct. 1981 33 p refs Presented at 1981 Aviation Lighting Sem., Williamsburg, Virginia, 9-13 Nov., 1981; sponsored by Illuminating Engineering Society of North America (RAE-TM-FS-432; BR80894) Copyright. Avail: NTIS HC A03/MF A01

The work of the Royal Aircraft Establishment (RAE) from its days as His Majesty's Balloon factory to modern times is summarized. Early setbacks to aircraft production included the 1909 War Office declaration that the airplane had no military value. The First World War changed this opinion and the interwar years saw an expansion which bore fruit in the development of the gyro gun sight, stabilized bomb sight and high speed aerial reconnaissance during World War 2. The tapered ladder effect used in airfield approach lighting systems was developed after the war, along with subsonic and supersonic wind tunnels. Recent projects involving the RAE include Concorde, Earth resources satellites, and head-up displays. Author (ESA)

HELICOPTER ROTOR PERFORMANCE IMPROVEMENT BY UTILIZATION OF SWEPT-BACK PARABOLIC BLADE TIP

J. J. Philippe and P. Lafon *In its* La Rech. Aerospatiale, Bi-monthly Bull. No. 1981-5, Sep. - Oct. 1981 (ESA-TT-725) Feb. 1982 p 55-56 refs Transl. into ENGLISH of La Rech. Aerospatiale, Bull. Bimestriel (Paris), No. 1981-5, Sep. - Oct. 1981

Avail: NTIS HC A04/MF A01; original report in FRENCH available at ONERA, Paris FF 45

A sweptback parabolic tip was designed so as to improve the working conditions of an advancing blade by reducing the intensity of the shock waves which arise and the drag associated with such shocks. The design is based on the computated pressure distribution on a helicopter blade in the fundamental case of a nonlifting rotor. The results of the computations clearly show the advantages of using this geometry for a rotor blade tip. Results of tests on such tips, performed in a wind tunnel on a three bladed rotor, demonstrate an overall improvement in the performance of the rotor. Author (ESA)

REAL TIME DIGITAL FILTERING TEST IN THE S1 CONTINUOUS WIND TUNNEL AT MODANE

J. Appel *In its* La Rech. Aerospatiale, Bi-monthly Bull. No. 1981-5, Sep. - Oct. 1981 (ESA-TT-725) Feb. 1982 p 57-61 ref Transl. into ENGLISH of La Rech. Aerospatiale, Bull. Bimestriel (Paris), No. 1981-5, Sep. - Oct. 1981 Avail: NTIS HC A04/MF A01; original report in FRENCH available at ONERA, Paris FF 45

A set of real time digital filters was used in a wind tunnel during testing of a transport aircraft model. The performance of the digital filters, programmed at various cutoff frequencies, was compared with that of analog filters already in use. Ten measuring channels, permitting computation of three aerodynamic coefficients for the model, were recorded. The operating principle of the real time digital filters is described. Results confirm the interest of low pass filtering at a very low cutoff frequency for restoring static parameters while a model is performing an angle of attack sweep in continuous mode. DYNAMIC ENVIRONMENTAL QUALIFICATION TECHNIQUES

Dec. 1981 245 p refs Partly in ENGLISH; one in FRENCH Proceedings of the 53rd Meeting of the Structures and Mater. Panel, Noordwijkerhout, Netherlands, 27 Sep. - 2 Oct. 1981 (AGARD-CP-318; ISBN-92-835-0306-6) Avail: NTIS HC A11/MF A01

The state of the art of dynamic qualification techniques and test methods for military aircraft with external stores are reviewed, including consideration of the rationale and interpretation of existing standards. The determination of environmental inputs from various sources and their application to specific aircraft and store configurations, including helicopters, are covered. Presentations were also given on the development of vibration analysis techniques and the evaluation of possible improvements in prediction methods and establishment of criteria.

MULTI-MISSION V/STOL WITH VECTORED THRUST ENGINES
W. J. Lewis and P. Simpkin 1981 10 p
(PNR-90086) Avail: NTIS HC A02/MF A01

The use of V / STOL aircraft in European conflicts is discussed. Conventional aircraft were assumed to be inoperative within 370 km of the main battle area because of the destruction of runways. Achievable bomb delivery rate of subsonic V/STOL aircraft, and available combat air patrol time and the number of aircraft required in order to maintain a standing patrol of supersonic aircraft were considered. If the Harrier concept is adapted, a single vectored thrust engine with plenum chamber burning on two front nozzles, and a single rear nozzle, then the V/STOL aircraft is well suited to supersonic and subsonic air superiority and strike roles. Author (ESA)

DIRECTIONAL SOLIDIFICATION: PROJECT B2 Final Report
C. Lecomte-Mertens, M. Lamberigts, and D. Coutsouradis May 1981 109 p refs Transl. into ENGLISH of Rept. no. TLT-00818A, Centre de Rech. Metal. (Belgium) Partly in ENGLISH and FRENCH
(PNR-90088; Trans-15572/TLT-00818A) Avail: NTIS HC A06/MF A01

Thermal fatigue of Mar-M-002 nickel alloy blades with an equiaxial or columnar (directional) structure, precision cast in the laboratory, was evaluated. Their thermal fatigue is compared with that of nickel alloy blades obtained elsewhere. Creep resistance of the Mar-M-002 structures was tested. The influence of chemical composition, grain orientation, microstructural fineness, the presence of carbides, and morphology was determined by metallography. Crack length is always greater in blades treated at 1100 C than in those treated at 1000 C. Blade geometry is the predominant factor in thermal fatigue. Crack resistance, in ascending order is: large solid blade (laboratory); small solid blade (outside supplier); small hollow blade (industrial). The metallographic structure is not a suitable criterion for differentiating between the thermal shock behavior of equaxial blades and that of columnar blades. Author (ESA)

CONTROL LAW DESIGN TO MEET CONSTRAINTS USING SYNPAC-SYNTHESIS PACKAGE FOR ACTIVE CONTROLS
William M. Adams, Jr. and Sherwood H. Tiffany Jan. 1982 16 p refs Presented at the Joint Automatic Control Conf., Charlottesville, Va., 17-19 Jun. 1981
(NASA-TM-83264; NAS 1.15:83264) Avail: NTIS HC A02/MF A01 CSCL 01C

Major features of SYNPAC (Synthesis Package for Active Controls) are described. SYNPAC employs constrained optimization techniques which allow explicit inclusion of design criteria (constraints) in the control law design process. Interrelationships are indicated between this constrained optimization approach, classical and linear quadratic Gaussian design techniques. Results are presented that were obtained by applying SYNPAC to the design of a combined stability augmentation/gust load alleviation control law for the DAST ARW-2. Author

AN ANALYSIS OF A NONLINEAR INSTABILITY IN THE IMPLEMENTATION OF A VTOL CONTROL SYSTEM
Jeanine M. Weber Mar. 1982 65 p refs
(NASA-TM-84220; A-8840; NAS 1.15:84220) Avail: NTIS HC A04/MF A01 CSCL 01C

The contributions to nonlinear behavior and unstable response of the model following yaw control system of a VTOL aircraft during hover were determined. The system was designed as a state rate feedback implicit model follower that provided yaw rate command/heading hold capability and used combined full authority parallel and limited authority series servo actuators to generate an input to the yaw reaction control system of the aircraft. Both linear and nonlinear system models, as well as describing function linearization techniques were used to determine the influence on the control system instability of input magnitude and bandwidth, series servo authority, and system bandwidth. Results of the analysis describe stability boundaries as a function of these system design characteristics. A.R.H.

EXPERIMENT ON ACTIVE FLUTTER SUPPRESSION OF A CANTILEVER WING
Takao Kikuchi and Hae Kyong Lee Dec. 1981 10 p refs In JAPANESE; ENGLISH summary
(NAL-TR-690; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

An experiment on active flutter suppression of a cantilever wing with the control surface at the wing tip is described. The experiment was done in a low subsonic wind tunnel. The deflection of the wing was measured by strain gages located near the root of the wing. The aileron was driven by a servomotor. Comparison was made between the present and previous results. It is concluded that the coefficients of the control law may have a different effect on the stability of the two- and three-dimensional models. Author

STUDIES ON WIND TUNNEL STRAIGHTENERS
F. Schultz-Grunow and K. Wieghardt Mar. 1982 16 p refs Transl. into ENGLISH from Luftfahrtforschung (West Germany), v. 17, no. 3, 20 Mar. 1940 p 82-86 Transl. by Kanner (Leo) Associates, Redwood City, Calif. original doc. prep. by Kaiser-Wilhelm Inst. for Flow Research, Goettingen (West Germany)
(Contract NASw-3541)
(NASA-TM-76689; NAS 1.15:76689) Avail: NTIS HC A02/MF A01 CSCL 14B

Tests using small-scale straighteners are reported. The studies allowed conclusions on the most favorable depth relationships, flow conditions behind the straightener and on the drag. The ways an obliquely hitting airflow is deflected by a straightener are examined. In addition the flow drag was measured and the manner in which the individual air columns emanating from the holes unite to form a homogeneous speed field was investigated. N.W.

DESIGN OF DYNAMICALLY-SCALED, ASYMMETRICAL WIND TUNNEL MODELS
M. E. Beyers 6 Aug. 1981 18 p refs
(NIAST-78/18) Avail: NTIS HC A02/MF A01

Dynamically scaled models are used in aerodynamic studies, notably in aircraft/store or stage separation studies. Techniques were developed for the design of free flight models in three general categories: dynamic stability free flight models, high maneuverability models optimized for nonoscillatory motion studies, and dynamic separation models. Dynamic scaling with fully simulated mass asymmetries play an important part in each of the three categories, particularly when nonplanar motions are simulated. The method is implemented in a 'FORTRAN IV DSAM'. S.L.

THE 737 GRAPHITE COMPOSITE FLIGHT SPOILER FLIGHT SERVICE EVALUATION Annual Report, May 1980 - Apr. 1981
Randy L. Coggeshall Feb. 1982 50 p refs
(Contract NAS1-11668)
(NASA-CR-165826; NAS 1.26:165826; D6-37330; AR-7) Avail: NTIS HC A03/MF A01 CSCL 11D

A flight service report was prepared which covers the flight service experience of 111 graphite epoxy spoilers on 737 transport aircraft and related ground based environmental exposure of graphite epoxy material specimens. Spoilers were installed on 28 aircraft representing seven major airlines operating throughout the world. Tests of removed spoilers after the seventh year of service continue to indicate modest changes in composite strength properties. Two spoilers were tested, one with 6 and one with 7 years of service, and both had residual strengths that fall within the original static strength scatter band. Both these units had typical service included discrepancies when tested. Based on visual, ultrasonic, and destructive inspection there continues to be no evidence of moisture migration into the honeycomb core and no core corrosion in the deployed units. M.D.K.

DEVELOPMENT AND DEMONSTRATION OF MANUFACTURING PROCESSES FOR FABRICATING GRAPHITE/LARC 160 POLYIMIDE STRUCTURAL ELEMENTS Final Report
R. K. Frost, J. S. Jones, P. J. Dynes, and D. H. Wykes Dec. 1981 499 p refs
(Contract NAS1-15371)
(NASA-CR-165809; NAS 1.26:165809) Avail: NTIS HC A21/MF A01 CSCL 11D

The development and demonstration of manufacturing technologies for the structural application of Celion graphite/LARC-160 polyimide composite material is discussed. Process development and fabrication of demonstration components are discussed. Process development included establishing quality assurance of the basic composite material and processing, nondestructive inspection of fabricated components, developing processes for specific structural forms, and qualification of processes through mechanical testing. Demonstration components were fabricated. The demonstration components consisted of flat laminates, skin/stringer panels, honeycomb panels, chopped fiber compression moldings, and a technology demonstrator segment (TDS) representative of the space shuttle aft body flap. FLIGHT SERVICE EVALUATION OF KEVLAR-49 EPOXY COMPOSITE PANELS IN WIDE-BODIED COMMERCIAL TRANSPORT AIRCRAFT Annual Flight Service Report
Robert H. Stone Jan. 1982 58 p refs
(Contract NAS1-11621)
(NASA-CR-165841; NAS 1.26:165841) Avail: NTIS HC A04/MF A01 CSCL 11D

Kevlar-49 fairing panels, installed as flight service components on three L-1011's, were inspected after 8 years service. The fairings had accumulated a total of 62,000 hours, with one ship set having 20,850 hours service. Kevlar-49 components were found to be performing satisfactorily in service with no major problems. The only defects noted were minor impact damage, a few minor disbonds and a minor degree of fastener hole fraying and elongation. The service history to date indicates that Kevlar-49 epoxy composite materials have satisfactory service characteristics for use in aircraft secondary structures. R.J.F.

SERVICE LIFE INVESTIGATION OF A SAILPLANE WING OF CFRP CONSTRUCTION
C. Kensche 1981 33 p refs In GERMAN; ENGLISH summary Presented at 17th OSTIV Congr., Paderborn-Haxterberg, West Germany, 28 May - 6 Jun. 1981
Avail: NTIS HC A03/MF A01

A sailplane wing of CFRP design was investigated to guarantee a higher stress level and longer service life than with glass fiber reinforced plastics and to define admissible design for the glider industry. Fatigue tests were run according to a block program. The residual wing strength was also tested. Periodic measurements are used to observe stiffness behavior during simulated service life. No change in stiffness is observed during the tests. Stress enhancement of 400 N/sq mm is admissible which increases service life from 3000 to 6000 hr. Author (ESA)

POWDER METALLURGICAL INNOVATIONS FOR IMPROVED HOT SECTION ALLOYS IN AERO-ENGINE APPLICATIONS
P. Wildgoose, N. G. Turner, H. F. Davies, B. J. Helliwell, R. Ubank, and H. Harrison 1980 27 p refs
(PNR-90072) Avail: NTIS HC A03/MF A01

The state of the art in powder material and processes for aircraft engine combustor, blade, and disk alloys was reviewed. Processes developed in the 1970's include: gas atomization of superalloy powder for critical rotating parts; rotating electrode atomization for titanium powder in similar components; controlled thermomechanical processing of attrited powders in order to produce superalloy sheet and airfoil parts; and plasma sprayed gas atomized powder for hot section overlay and thermal barrier coatings. Development in titanium powder metallurgy is hampered by difficulties in obtaining clean powder. Properties equivalent to a conventionally processed product are obtained in current alloys, with possible cost advantages. Author (ESA)

ENGINEERING PROPERTY COMPARISONS OF 7050-T73651, 7010-T7651 AND 7010-T73651 ALUMINUM ALLOY PLATE
L. Schra and W. G. J. tHart Dec. 1980 33 p refs Submitted for publication
(NLR-MP-80047-U) Avail: NTIS HC A03/MF A01

The strength, stress corrosion resistance, fracture toughness and fatigue crack propagation resistance under flight simulation loading of aluminum alloys was tested. Standard tensile, notch, center cracked and flight simulation tests were performed. In order to study stress corrosion crack initiation, tuning fork type specimens were clamped to a wheel which immersed them in a 3.5% aqueous NaCl solution for 10 min/hr. Testing lasted for two months. Results show that both 7050 and 7010 are high strength deep hardening alloys with only minor differences in crack tolerance properties. The fracture toughness of both alloys is equivalent, while 7050 possesses slightly better resistance to stress corrosion cracking and fatigue crack propagation under flight simulation loading. DEVELOPMENT OF A CONVOLUTED INTAKE SEAL FOR MODEL R66

A. P. Winstanley Mar. 1981 33 p refs
(BAE-ARG-163) Copyright. Avail: NTIS HC A03/MF A01

A low constraint convoluted seal is described which connects the live intake to the earthed ejector duct in a 1/7.5 scale low speed model with full engine simulation. A 6 component model with two earthed ejectors is required. Several seals were tested, achieving a progressively lower constraint by modifying either the geometry, material or manufacturing process. Subjecting the final seal to a representative pressure difference and end offset causes a lateral load of 6N, but incorporating the modifications recommended for future seals reduces this. Because the seals are on a moment arm from the balance when they are installed in the model, calibrations may have to account for pressure and end misalignment. A facility for measuring pressure differences at the seal is incorporated in the design. Author (ESA)

MULTILAYER INSULATION BLANKETS FOR SPACECRAFT APPLICATIONS. THERMAL MODEL ACCOUNTING FOR OUTGASSING AND DIFFERENT WAYS OF GAS MIGRATION

A. A. M. Delil and J. F. Heemskerk 2 Sep. 1981 10 p refs Presented at 7th Intern. Heat Transfer Conf., Munich, 6-10 Sep. 1982
(NLR-MP-81051-U) Avail: NTIS HC A02/MF A01

A model of hybrid pumping (broadside and edge) in spacecraft insulation blankets was developed for an evacuated circular multilayer insulation blanket placed between a hot and a cold boundary. The blanket consists of parallel identical perforated shields with left and right side emissivity. Shield thickness is so small that shield temperature is assumed to be even. The gas is assumed to flow from the hot towards the cold boundary, as in the case of insulation of a hot black box from cold space environment. The model also applies for cryogenic vessel insulation (the cryogen at the cold side, the low pressure environment at the hot boundary) by interchanging suffixes in the governing equations. Results from guarded hot plate calorimeter tests confirm model predictions. Author (ESA)

THE EFFECT OF AN ACIDIC CATALYST ON SIMULTANEOUS HYDRODENITROGENATION AND HYDRODESULFURIZATION OF MODEL COMPOUNDS Ph.D. Thesis

Holly Jean Moore 1981 171 p
Avail: Univ. Microfilms Order No. 8125903

The hydrodesulfurization of thiophene and the hydrodenitrogenation of pyridine over acidic catalysts was studied. Four catalysts were considered: CoMo-SiO2/Al2O3, CoMo-Al2O3, NiW-SiO2/Al2O3, and NiW-Al2O3. These catalysts were chosen so that the effect of the metallic complex and the effect of the acidic support could be isolated. Reaction conditions of 200 to 400 C and 40 to 200 psia were used. A two site reaction mechanism (sites 1 and 2) based on the Langmuir adsorption isotherm was used to model the reaction of thiophene. A single site (site 1) analysis described the reaction of pyridine. Values of the reaction rate constants (k), and the adsorption equilibrium constants (K) were calculated from the data collected for pure thiophene, pure pyridine, and for a 50/50 solution of each. The results showed that both thiophene and pyridine adsorb significantly on the type 1 sites, but not on the type 2 sites. No consistent metal effect (NiW or CoMo) was observed. However, alumina was the more effective catalyst substrate for the reaction of both thiophene and pyridine for 50/50 feeds. Alumina was also more effective for pure thiophene reaction, but silica alumina was more effective for pyridine reaction from a pure feed. Dissert. Abstr.

BLOCKAGE AND FLOW STUDIES OF A GENERALIZED TEST APPARATUS INCLUDING VARIOUS WING CONFIGURATIONS IN THE LANGLEY 7-INCH MACH 7 PILOT TUNNEL

Cindy W. Albertson Mar. 1982 50 p
(NASA-TM-83301; NAS 1.15:83301) Avail: NTIS HC A03/MF A01 CSCL 20D

A 1/12th scale model of the Curved Surface Test Apparatus (CSTA), which will be used to study aerothermal loads and evaluate Thermal Protection Systems (TPS) on a fuselage-type configuration in the Langley 8-Foot High Temperature Structures Tunnel (8 ft HTST), was tested in the Langley 7-Inch Mach 7 Pilot Tunnel. The purpose of the tests was to study the overall flow characteristics and define an envelope for testing the CSTA in the 8 ft HTST. Wings were tested on the scaled CSTA model to select a wing configuration with the most favorable characteristics for conducting TPS evaluations for curved and intersecting surfaces. The results indicate that the CSTA and selected wing configuration can be tested at angles of attack up to 15.5 and 10.5 degrees, respectively. The base pressure for both models was at the expected low level for most test conditions. Results generally indicate that the CSTA and wing configuration will provide a useful test bed for aerothermal pads and thermal structural concept evaluation over a broad range of flow conditions in the 8 ft HTST. HISTORICAL PERSPECTIVES ON THERMOSTRUCTURAL RESEARCH AT THE NACA LANGLEY AERONAUTICAL LABORATORY FROM 1948 TO 1958

Richard R. Heldenfels *In its* Computational Aspects of Heat Transfer in Struct. 1982 p 383-392 refs

Avail: NTIS HC A24/MF A01 CSCL 20D

Some of the early research on structural problems produced by aerodynamic heating, conducted at the Langley Aeronautical Laboratory of the National Advisory Committee for Aeronautics from 1948 to 1958 is described. That was the last decade of the NACA; in 1958 NACA became the nucleus of NASA. The NACA initially contracted for research but was aware that a well-equipped and suitably staffed laboratory was required to fulfill its obligations. Langley was established in 1920; the other listed were added during the NACA expansion in the World War II years. Some specific research activities are described, starting with calculation of the temperature of the structure. B.W.

COMPARISON OF RELIABILITY, SENSITIVITY AND ACCURACY OF SOME NDI-TECHNIQUES

E. A. B. deGraaf and P. deRijk Oct. 1980 32 p refs In DUTCH; ENGLISH summary Presented at Dutch Soc. for Non-Destructive Testing Lecture Series, 4 Nov. 1980

(NLR-MP-80039-U) Avail: NTIS HC A03/MF A01

Reliability, sensitivity and accuracy of some nondestructive inspection (NDI) methods were investigated and compared. Reliability, sensitivity and accuracy of nondestructive inspection are defined. The restrictions on reusing NDI reliability specimens are described. Inspection results obtained with fluorescent and red penetrants are compared. Reliability, sensitivity and accuracy of a number of the most popular NDI methods, as applied to aluminum specimens and rejected steel aircraft landing gear components are treated. Three investigations are briefly depicted. Spreading in NDI results is substantial. Corrosion deteriorates reliability, sensitivity and accuracy. Red penetrant is much worse than fluorescent penetrant. Fluorescent penetrant inspection results strongly depend on the specimen configuration and vary from very good to moderate. Eddy current method gives good results. Magnetic inspection is advisable wherever it can be applied. Author (ESA)

A TWO-DEGREE-OF-FREEDOM FLUTTER MOUNT SYSTEM WITH LOW DAMPING FOR TESTING RIGID WINGS AT DIFFERENT ANGLES OF ATTACK

Moses G. Farmer Apr. 1982 20 p refs Presented at Va. Academy of Sci. Meeting, Blacksburg, Va., 20-23 Apr. 1982

(NASA-TM-83302; NAS 1.15:83302) Avail: NTIS HC A02/MF A01 CSCL 14B

A wind tunnel model mount system for conducting flutter research using a rigid wing was developed. The wing is attached to a splitter plate so that the two move as one rigid body. The splitter plate is supported away from the tunnel wall by a system of rods with fixed fixed and conditions. The rods flex in such a way that only pitch and plunge oscillations are permitted. At the tunnel wall the rods are attached to a remotely controlled turntable so that angle of attack can be varied. Wind tunnel data obtained by using the mount system are presented for a supercritical and a conventional airfoil. Both classical flutter and stall flutter data are presented. S.L.

A THEORETICAL STUDY OF THE IMPACT OF AIRCRAFT WAKE VORTICES ON ROOFS IN THE FINAL APPROACH AREA OF DUSSELDORF AIRPORT

Otto Weber and Rolf Ulken Dec. 1981 63 p refs In GERMAN; ENGLISH summary

(DFVLR-Mitt-82-01) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 21,50

Damage to buildings caused by the impact of trailing wake vortices shed from widebodied aircraft in the final approach area of Dusseldorf Airport was studied. Forty-two occurrences of roof damage were analyzed, using a simplified model for the strength, transport, and decay of wake vortices. The model is interpreted with reference to the results of a vortex alleviation program carried out in the U.S. Wake vortex characteristics, maximum tangentinl velocity and vortex decay are discussed. Measurement of vortex far field reduction is considered. Other investigations of roof damage in the approach areas of Hamburg, Berlin (Tempelhof), and London (Heathrow) airports are summarized. The value of potential aircraft modifications and precautions on the ground are assessed, suggesting supplementary measurements on board aircraft and in buildings. Author (ESA)

SOME CASE STUDIES AND THE SIGNIFICANCE OF FATIGUE THRESHOLDS

R. J. H. Wanhill Apr. 1981 15 p refs Presented at Intern. Symp. on Fatigue Thresholds, Stockholm, Jun. 1981

(NLR-MP-81015-U) Avail: NTIS HC A02/MF A01

Examples of service failures, involving low-cycle and/or high-cycle fatigue, are described and discussed with respect to the significance of thresholds for high-cycle fatigue crack propagation. The examples are: aircraft undercarriage cylinders made of high strength 4340 steel; aircraft gas turbine compressor drive shafts made of A286 steel; and aircraft gas turbine blades made of Rene 80 nickel-base superalloy. The examples show that the importance of Delta K sub th is unlikely to be important for a particular service fatigue problem. Delta K sub th as a design criterion is restricted to safe crack growth components and structures whose anticipated service loads consist mainly or entirely of large numbers of low amplitude cycles and which are difficult or impossible to inspect in service. AN INVESTIGATION OF ROTOR HARMONIC NOISE BY THE USE OF SMALL SCALE WIND TUNNEL MODELS Final Report

Harry Sternfeld, Jr. and Edward G. Schaffer Apr. 1982 100 p refs

(Contract NAS2-10767)

(NASA-CR-166337; NAS 1.26:166337) Avail: NTIS HC A05/MF A01 CSCL 20A

Noise measurements of small scale helicopter rotor models were compared with noise measurements of full scale helicopters to determine what information about the full scale helicopters could be derived from noise measurements of small scale helicopter models. Comparisons were made of the discrete frequency (rotational) noise for 4 pairs of tests. Areas covered were tip speed effects, isolated rotor, tandem rotor, and main rotor/tail rotor interaction. Results show good comparison of noise trends with configuration and test condition changes, and good comparison of absolute noise measurements with the corrections used except for the isolated rotor case. Noise measurements of the isolated rotor show a great deal of scatter reflecting the fact that the rotor in hover is basically unstable. Author

RESEARCH AND TECHNOLOGY ANNUAL REPORT FY-1981

Nov. 1981 100 p

(NASA-TM-84199; NAS 1.15:84199) Avail: NTIS HC A05/MF A01 CSCL 05A

Space transportation systems are summarized: space shuttle enhancement, a space operations center, the space platform, and geostationary activities are discussed. Aeronautics and space technology are summarized: experiments, energy systems, propulsion technology, synthetic aperture radar, large space systems, and shuttle-launched vehicles are discussed. Space sciences are summarized: lunar, planetary, and life sciences are discussed. Space and terrestrial applications are summarized. The AgRISTARS program, forest and wildland resource, and Texas LANDSAT applications are discussed. N.W.

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 151)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in July 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

study should be undertaken by the ICAO Secretariat. A report is provided on developments both at national and international levels connected with the considered subject. Major trends in recent ICAO thinking on the technical side of aircraft and incident investigation procedures are examined, and developments in the U.S. are considered. Resolutions adopted by the European Parliament in relation to air traffic safety issues are also discussed, and attention is given to developments in the Netherlands, Switzerland, Sweden, New Zealand, and Canada. G.R.

A82-29414 **Soaring Society of America, National Convention, Phoenix, AZ, January 14-18, 1981, Proceedings.** Edited by J. Lincoln. Phoenix, AZ, Arizona Soaring Association, 1981. 120 p.

Features of modern sailplaning, contests, and hang gliding are reviewed. Equipment maintenance and use in sailplanes are discussed, including the calibration of variometers, charging batteries, and types of batteries. Sport hang gliding is described, as is competition tactics and photography. Homebuilt sailplanes are examined from the point of view of a home sailplane builder and a manufacturer of kits, and NASA research relevant to sailplane airfoils is explored. Finally, new concepts in Dolphin Tactics for continuously changing airspeed to maximize performance during a variety of sailplane maneuvers are detailed. M.S.K.

A82-29415 **Checking and calibrating variometers in place in the sailplane instrument panel.** R. H. Ball. In: Soaring Society of America, National Convention, Phoenix, AZ, January 14-18, 1981, Proceedings. Phoenix, AZ, Arizona Soaring Association, 1981, p. 29-38.

Techniques for calibrating the variometer, pitot total energy compensation, and netto and cruise controls while they are in a glider instrument panel are described. The panel is assumed to feature an altimeter and clock, and further tools recommended are a bottle, a needle valve, a hypodermic syringe, tubing, and fittings. Exact calibration of the variometer in conjunction with the altimeter by setting the pressure equal to 3000 ft using a bottle is described, along with descent rate measurements to assure proper altitude change tracking. Further discussion is given of calibrating a total energy variometer, checking airspeed with an altimeter, the netto compensation principle and calibration, and calibrating the cruise control. Finally, attention is given to altitude errors with a variometer and to best flying speed at various altitudes. M.S.K.

A82-29416 **Development of a homebuilt powered sailplane.** A. Strojnik. In: Soaring Society of America, National Convention, Phoenix, AZ, January 14-18, 1981, Proceedings. Phoenix, AZ, Arizona Soaring Association, 1981, p. 77-89.

Design and problem solving in the fabrication of the S-2, a 15 m powered sailplane test flown in 1980, are discussed. Weight penalties, the use of a retractable engine to maintain aerodynamic cleanliness, increases in drag due to the presence of an enlarged fuselage area and a propeller, and the normal solution of placing the engine at the rear of a pod-and-boom fuselage are detailed. The S-2 features outrigger wheels on the wingtips, one under the pod, and the steering wheel under the tail. The wings are constant chord with trapezoidal outer 4 ft sections to furnish an elliptical lift distribution at high lift coefficients. A middle wing section is reinforced by a carbon fiber spar, covered in 3-layer fiberglass skins, and shaped into a Wortman airfoil. Young's moduli for the materials are provided. The quality of the wing skin and the precision machining of the propeller are regarded as the two most crucial aspects of the S-2. M.S.K.

A82-29417 * **NASA research related to sailplane airfoils.** D. M. Somers (NASA, Langley Research Center, Hampton, VA). In: Soaring Society of America, National Convention, Phoenix, AZ, January 14-18, 1981, Proceedings. Phoenix, AZ, Arizona Soaring Association, 1981, p. 99-109. 8 refs.

The theoretical methods and experimental facilities at the NASA Langley Research Center have been employed to conduct investigations of sailplane airfoils. The unique and powerful capabilities of the Eppler Program have been used to design and analyze many airfoils and to smooth several Wortmann airfoils. Wind-tunnel investigations of two sailplane airfoils have been conducted in the Langley low-turbulence pressure tunnel. A procedure for sailplane performance improvement has been outlined. (Author)

A82-29576 **Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports (Brand- und Katastrophenbekämpfung aus der Luft; Internationales Wissenschaft-Technisches Symposium, Hanover, West Germany, June 11, 12, 1980, Vorträge).** Symposium sponsored by the Bundesministerium für Forschung und Technologie. Melsungen, West Germany, A. Bernecker Verlag, 1981. 242 p. In German. $16.25.

Attention is given to fighting forest fires with the aid of aircraft in the U.S., the fighting of forest fires as a task for the Swiss air force, the current state of technology concerning the fighting of forest fires from the air in Austria, the utilization of agricultural aircraft in economical operations for fighting fires in Israel, and the utilization of aircraft in fighting forest fires in France. The use of 'water bombers' and chemical agents against forest fires is considered along with the employment of two-engine and four-engine aircraft for dropping the latest chemical fire extinguishing agents in connection with the fighting of forest fires, the adaptation and equipment of aircraft for the fighting of forest fires, and the employment of helicopters in Austria in connection with large-scale fires in buildings. Other topics discussed are related to the performance characteristics and employment profiles of the new helicopter BK117, and a comparative evaluation of fire extinguishing agents involving the use of foam. G.R.

Keegan (U.S. Forest Service, Washington, DC). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 17-27. In German.

A82-29578 # **Fighting forest fires - A task for the Swiss air force (Waldbrandbekämpfung - Eine Aufgabe der Schweizerischen Flugwaffe).** R. Salzborn (Schweizer Luftwaffe, Locarno, Switzerland). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 28-33. In German.

Forest fires in the Swiss Alps are considered. It is found that the great majority of all fires is produced by people. The development of a fire as a consequence of lightning is a very rare event. Long-term consequences of forest fires are related to a reduction in the natural capacity of forests to provide protection against avalanches and falling stones. Efforts to fight fires with the aid of aircraft go back to 1962. Fixed-wing aircraft were first utilized in firefighting operations. However, in recent years the use of such aircraft has decreased significantly in connection with the advantages provided by the helicopter for the considered applications. Attention is given to the methods used in firefighting operations conducted with fixed-wing aircraft and with helicopters, taking into account direct approaches and indirect support action. G.R.

A82-29579 # **The current state of technology concerning the fighting of forest fires from the air in Austria (Stand der Technik zur Waldbrandbekämpfung aus der Luft in Österreich).** T. Angermair (Berufsfeuerwehr, Innsbruck, Austria). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 34-39. In German.

In 1973, difficulties related to the fighting of forest fires by conventional means led in Austria to an investigation of more effective firefighting methods. It was first attempted to provide aircraft to ensure rapid transportation for the men and the equipment needed for the firefighting operations. The helicopter was found to provide significant advantages as a rapid means of transportation, taking into account its capability to convey men and material to and from locations not readily accessible by any other means. The successful solution of all problems related to the envisaged use of the aircraft in firefighting operations was practiced in approximately 300 exercises. Attention is given to the number of aircraft used in Austria for firefighting operations, the employed fire extinguishing agents, the attachment of the containers to the aircraft, financial questions, and details concerning the firefighting operations. G.R.

A82-29580 # **The utilization of agricultural aircraft in economical operations for fighting forest fires in Israel (Die Nutzung landwirtschaftlicher Flugzeuge zur ökonomischen Waldbrandbekämpfung in Israel).** I. Hirsch (Chimavir Services, Tel Aviv, Israel). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 40-43. In German.

The approaches used to protect the coniferous forests of Israel against destruction by forest fires are discussed. The need for such a protection is illustrated by the fact that, in 1979, 2,500,000 trees were destroyed in connection with a total of 600 fires. It had been found that forest fires cannot be effectively controlled on the basis of an exclusive use of ground operations. However, financial considerations made it impossible to obtain for the protection of the forests special aircraft expressly designed for firefighting applications. It was, therefore, decided to utilize aircraft normally used for agricultural applications also for operations related to the fighting of forest fires. Particular attention is given to special approaches which make it possible to apply water for extinguishing fires most effectively from the available aircraft. G.R.

A82-29581 # **The utilization of aircraft in fighting forest fires - French experience (Nutzung der Luftfahrtmittel bei der Waldbrandbekämpfung - Französische Erfahrungen).** H. Bolzinger (Ministère de l'Intérieur, Securité Civile, Marignane, Bouches-du-Rhône, France). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 44-52. In German.

Environmental and weather-related conditions in the case of a substantial part of the French forests, taking into account, in particular, coniferous woods, make it necessary to employ aircraft in connection with the protection of these forests against destruction by fire. In 1963, aircraft were used, for the first time in France, in operations related to the fighting of fires in forests. A review is provided of the aircraft available in 1980 for the protection of French forests against destruction by fire, giving attention to light aircraft used in surveillance operations, helicopters, and air tankers. The helicopter can provide a flying command post for the direction of firefighting operations. Other functions of the helicopter are related to its use as a convenient means of transportation in areas with accessibility problems. The air tanker carries water and other agents for an employment in direct firefighting operations from the air. G.R.

A82-29582 # **The use of 'water bombers' and chemical agents against forest fires, taking into account the employment of a first-attack system (Einsatz von Wasserbombern und chemischen Mitteln gegen Waldbrände unter Verwendung eines Erstangriffssystems).** K. B. Marsden (Conair Aviation, Ltd., Abbotsford, British Columbia, Canada). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 66-79. In German.

Fires in the forests, arid lands, and agricultural areas of Western Canada are efficiently controlled by making use of aircraft which drop chemical firefighting agents that remain effective for a long time. The considered approach of fighting fires must be integrated into a coordinated program, involving an early detection of the fire, the availability of aircraft for immediate employment, and the ultimate complete extinction of the fire in connection with ground-based operations. Attention is given to the geographical features of the area of Western Canada, its meteorological characteristics and its vegetation, the design of the employed aircraft, and details regarding the implementation of the considered program. The operations performed by the aircraft are illustrated with the aid of pictures. G.R.

A82-29583 # **The employment of two-engine and four-engine aircraft for dropping the latest chemical fire extinguishing agents in connection with the fighting of forest fires (Einsatz von zwei- und viermotorigen Flugzeugen für den Abwurf der neuesten chemischen Löschmittel bei der Waldbrandbekämpfung).** R. A. Davis (Sis-Q Flying Service, Inc., Santa Rosa, CA). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 88-96. In German.

A82-29584 # **Adaptation and equipment of aircraft for the fighting of forest fires (Anpassung und Ausrüstung von Flugzeugen zur Waldbrandbekämpfung).** R. E. Foy (Aero Union Corp., Chico, CA). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 97-103. In German.

In connection with the selection of an aircraft for aerial firefighting operations, two alternatives have to be considered. An aircraft expressly designed for firefighting applications can be purchased, or an available aircraft designed for civil or military service applications can be acquired with the aim to adapt the aircraft to the requirements which have to be met in connection with the intended future use. Taking into account the high cost of a new aircraft design, it might be preferable, on the basis of economic considerations, to decide in favor of the second alternative. All private firms concerned with the operation of aircraft for the aerial application of fire retardants and fire extinguishing agents in North America use currently surplus civil aircraft or former military aircraft. Attention is given to economic considerations regarding the operations of such aircraft, questions of aircraft suitability for the envisaged applications, and operational details. G.R.

A82-29585 # **The employment of helicopters in Austria in connection with large-scale fires in buildings (Hubschraubereinsätze bei Gebäudegrossbränden in Österreich).** T. Angermair (Berufsfeuerwehr, Innsbruck, Austria). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 138-146. In German.

Special problems concerning rescue operations in the case of large fires in buildings and the fighting of these fires exist in Austria in a very significant number of cases. About one tenth of all Austrians live in high buildings at levels above the 'critical height' of 22 m from the ground. In connection with fires, situations arise in which people are isolated because all possible avenues of retreat have been cut off. The chances for the rescue of people in burning buildings can be significantly improved by supplementing the conventional approaches of the fire department with techniques involving the use of helicopters. It has been found that in the case of pilots experienced in rescue operations in mountainous areas very little additional training is required for the conduction of operations involving the rescue of people in buildings. The conduction of such operations is discussed in detail. G.R.

A82-29586 # **Performance characteristics and employment profiles of the new helicopter BK117 (Leistungsmerkmale und Einsatzprofile des neuen Hubschraubers BK117).** Mr. Schmidt-Bischoffshausen (Messerschmitt-Bölkow-Blohm GmbH, Ottobrunn, West Germany). In: Fighting fire and other disasters from the air; International Scientific-Technical Symposium, Hanover, West Germany, June 11, 12, 1980, Reports. Melsungen, West Germany, A. Bernecker Verlag, 1981, p. 148-166. In German.

Attention is given to a new helicopter developed jointly by a German aerospace company and a Japanese company. The helicopter can take off and land vertically, has the ability to hover, and can also move slowly in any lateral direction. These flight characteristics have provided for the helicopter a special area of application related to the prevention of fires, the fighting of fires, and protective operations in the case of the occurrence of disasters. Requirements for successful operations involving the fighting of fires are considered, taking into account the importance of an early detection of a fire, the need for an immediate initiation of operations, the achievement of an

DYNAMIC QUALIFICATION TESTING OF F-16 EQUIPMENT
H. E. Nevius and W. J. Brignac *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 15 p

Avail: NTIS HC A11/MF A01

Vibration prediction methods and qualification test procedures are presented for F-16 equipment. Measured vibration levels are also compared to the predictions. The most severe vibratory environment is produced by the muzzle blast pressure during gunfiring. Gunfiring vibration was measured during the YF-16 prototype program which indicated a correlation between vibration levels and distance from the gun port. Vibration data are presented verifying this relationship. Nongunfiring random vibration test levels are shown for F-16 airframe zones. The prediction procedures were based on a relationship between vibration and dynamic pressure using measured data from other aircraft. Vibration levels were measured on fuselage mounted stores. Other measured dynamic environments are presented which include wing tip missile response to store ejection from wing pylons and to jet wake encounter, and buffet response at high-angles-of-attack. Author

N82-22160# McDonnell-Douglas Corp., St. Louis, Mo. Structural Dynamics Sect.
DEVELOPMENT OF VIBRATION QUALIFICATION TEST SPECTRA FOR THE F-15 AIRCRAFT
G. R. Waymon *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 19 p refs

Avail: NTIS HC A11/MF A01

The vibration test spectra used for an F-15 Eagle were based on analytical predictions combined with measured data from similar aircraft. The low frequency vibration below approximately 50 Hertz results primarily from aircraft response to gusts, buffet, landing, and taxi excitation. Vibration at higher frequencies is primarily associated with acoustical excitation and gunfire. The airplane was divided into regions of comparable vibration levels. The test levels were derived using the predicted spectra and applying factors to define a performance and an endurance test. The F-15 flight measured data were used to update these predictions for the present test spectra. Author

ACOUSTIC NOISE TEST AS PART OF THE DYNAMIC QUALIFICATION PROGRAM IN AEROSPACE
G. Bayerdoerfer *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 7 p
Avail: NTIS HC A11/MF A01

The mechanisms of noise generation for the purpose of acoustic qualification tests are described. Special emphasis is given to the modal density of acoustic noise fields in enclosures, such as reverberation chambers. A test program shows that for small components a sufficient modal density can be achieved in relatively small test chambers. Where applicable small chambers are favorable because of the lower test costs. Author

N82-22164# Vereinigte Flugtechnische Werke-Fokker G.m.b.H., Bremen (West Germany). Abt. Dynamik/Aeroelastik.
AIRCRAFT FUEL TANK SLOSH AND VIBRATION TEST

Helmut Zimmermann *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 11 p

Avail: NTIS HC A11/MF A01

A dynamic qualification test for a subsonic and a supersonic external drop tank for a European fighter is presented. The test rig and the specimens are described and the measuring results are discussed. It is shown that for the supersonic tank as well as for the subsonic tank a certain slosh angle an eigenfrequency of the rig increases the amplitudes at the excitation position and the accelerations on the tank. For the subsonic tank it seems that an eigenfrequency is excited for the nose down position of the tank. The qualification requirements are examined. It is proposed that instead of using an arbitrary vibration amplitude and frequency for excitation, frequency ranges and amplitudes which are averaged out of flight measurements at the tank attachment points on the aircraft be used and that the demand for a certain input amplitude at the top of the attachment bulkheads and an output amplitude at the bottom of the attachment bulkheads be deleted. E.A.K.

N82-22165# Army Aviation Research and Development Command, St. Louis, Mo. Structures and Aeromechanics Div.
THE STRUCTURAL DYNAMIC INTERFACE REQUIRED FOR DEVELOPING HELICOPTER TARGET ACQUISITION SYSTEMS
Sam T. Crews *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 9 p refs

Avail: NTIS HC A11/MF A01

A brief description of the helicopter vibration environment is given. Two development programs were used as examples to show how vibration sensitive target acquisition systems can be interfaced to a helicopter. The systems are the Target Acquisition Data System/Pilot Night Vision System mounted to the nose of the Army's new Advanced Attack Helicopter and the Stand-Off Target Acquisition System mounted underneath the Army's BLACK HAWK helicopter. The qualification strategy and specific testing performed and to be performed are included. Author

N82-22166# Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany).
APPROACH IN DYNAMIC QUALIFICATION OF LIGHT HELICOPTER STORES AND EQUIPMENTS
D. Braun and J. Stoppel *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 8 p refs

Avail: NTIS HC A11/MF A01

Problems occurring in connection with the dynamic qualification of equipment and external stores for light military helicopters are evaluated. Special features of the helicopter vibratory environment are discussed. Some general recommendations for the procedure of dynamic qualification for use with helicopters are given. The approach for dynamic qualification of relatively heavy equipment is presented using the example of combining the MBB BO 105 helicopter with HOT anti-tank missile launchers. To obtain a basic understanding of the dynamic behavior of the helicopter with external stores preliminary dynamic calculations were made. Shake tests were done with the separated external stores and flight test vibration measurements were obtained. Test results are presented with regard to the harmonic main rotor excitation. M.D.K.

THE DYNAMIC QUALIFICATION OF EQUIPMENT AND EXTERNAL STORES FOR USE WITH ROTARY WINGED AIRCRAFT
G. M. Venn *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 11 p
Avail: NTIS HC A11/MF A01

The dynamic regime imposed on helicopter-borne stores and equipment, highlighting the differences between the rotary and fixed-wing environments are outlined. The need for helicopter requirements to be addressed in particular, is discussed. The influence of a number of contributory factors to the dynamic environment arising from varying military applications covering both land and sea operation is also discussed. The dynamic criteria for design and testing are given, explaining the particular influence of discrete sinusoidal forcing on the helicopter environment. The evolution of these standards and their consolidation through flight and service experience is explained. Some views on the future development of dynamic qualification criteria for rotary-winged aircraft are also outlined. M.D.K.

N82-22168# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany). Inst. of Aeroelasticity.

APPLICATION OF MODAL SYNTHESIS TECHNIQUES FOR THE DYNAMIC QUALIFICATION OF WINGS WITH STORES

E. Breitbach *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 22 p refs

Avail: NTIS HC A11/MF A01

Dynamic qualification as well as flutter clearance of modern combat aircraft were studied using model coupling methods. Emphasis was placed on how to deal with special phenomena due to nonlinearities, in particular combinations of backlash and dry friction, in the connecting parts between wing, pylon and store which may significantly infringe on the validity of the linear mathematical models as used in ground and flight vibration testing. M.D.K.

N82-22169# Boeing Military Airplane Development, Seattle, Wash. Structural Dynamics Dept.

STOL AIRCRAFT STRUCTURAL VIBRATION PREDICTION FROM ACOUSTIC EXCITATION

B. F. Dotson and J. Pearson (AFWAL) *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 20 p refs

Avail: NTIS HC A11/MF A01

A method was developed to improve environment vibration prediction methods, particularly in the lower frequency range where high acoustic excitation is expected on STOL aircraft. A rigorous mathematical spectral analysis approach was used which simulated the structure with finite element models (FEM) and used measured and calculated acoustic input data for the forcing function. Calculated and measured vibrations levels were compared on a medium sized Upper Surface Blowing (USB) STOL aircraft. The development of a method for prediction of the external acoustic environment of USB flap-type STOL aircraft was also accomplished. The method compares favorably with actual measurements and represents a significant improvement in acoustic prediction methods for aircraft with USB type flaps. The method includes scaling factors for engine size, thrust, aircraft size, and other parameters. Finally, noise and vibration levels were predicted on a small STOL aircraft and later compared to measured data. Author

GUNFIRE BLAST PRESSURE PREDICTIONS

R. M. Munt, A. J. Perry, and S. A. Moorse *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 20 p refs

Avail: NTIS HC A11/MF A01

A scheme for predicting the blast pressures from aircraft guns is presented which extends existing theory. The predictions correlate well with some experimental measurements of gun blast pressures in free space. Blast pressures were also measured experimentally on a surface in the vicinity of the muzzle of a 7.62 mm rifle but these could only be satisfactorily predicted in regions where the classical theory of regular reflection of shock waves could be applied. These results are discussed in relation to the surface blast pressures from aircraft mounted guns. Author

N82-22171# Grumman Aerospace Corp., Bethpage, N.Y.

DEVELOPMENT OF A TAPED RANDOM VIBRATION TECHNIQUE FOR ACCEPTANCE TESTING

John Devitt, Richard Pokalius, Joseph Popolo, and Eugene Baird *In* AGARD Dyn. Environ. Qualification Tech. Dec. 1981 8 p

Avail: NTIS HC A11/MF A01

The use of random vibration as a screen for latent workmanship problems normally found in avionic equipment, proved to be significantly more effective than the sinusoidal form of excitation normally employed. This was demonstrated and is now required for acceptance testing by various DoD agencies. The results of a program to develop an economical technique for generating random vibration utilizing an audio tape deck indicate that compensating factors can be developed to account for the variations that exist in generically identical equipment. Using these factors, synthetic random tapes were generated. Author

MAINTENANCE IN SERVICE OF HIGH TEMPERATURE PARTS

Jan. 1982 182 p refs Meeting held at Noordwijkerhout, Netherlands, 27 Sep. - 2 Oct. 1981

(AGARD-CP-317) Avail: NTIS HC A08/MF A01

The problem areas in the inspection, repair, and life extension and prediction of gas turbine engine parts are addressed.

N82-22173# Ministry of Defence, London (England).

MILITARY MAINTENANCE POLICIES AND PROCEDURES FOR HIGH-TEMPERATURE PARTS. WILL THEY BE ADEQUATE?

R. B. G. Hedgecock *In* AGARD Maintenance in Serv. of High Temp. Parts Jan. 1982 7 p refs

Avail: NTIS HC A08/MF A01

The problems involved in developing engine parts maintenance policies which incorporate life estimation, inspection, repair and containment of costs are examined. Computer-based engine usage monitoring systems and a low cycle fatigue counter are described along with assembled and unassembled engine inspection procedures and repair techniques. M.G.

N82-22174# Dayton Univ., Ohio. Graduate Materials Engineering Program.

ENGINE DEPOT MAINTENANCE REPAIR TECHNOLOGY

James A. Snide and William J. Schulz (AFWAL) *In* AGARD Maintenance in Serv. of High Temp. Parts Jan. 1982 19 p refs

Avail: NTIS HC A08/MF A01

The scope and mission of the two USAF engine Air Logistics Centers are described. The various processes and organizational structure to identify repair technology requirements are discussed. Approaches to transition and implementation of new technology into a repair depot environment are described. Specific examples of technology developments described are: braze repair, laser metrology, electrophoretic, coatings, sputtered MCrAlY overlay coating and inlet guide vane vibration damping. Author

MAINTENANCE EXPERIENCE WITH CIVIL AERO ENGINES

J. Ph. Streebach *In* AGARD Maintenance in Serv. of High Temp. Parts Jan. 1982 3 p

Avail: NTIS HC A08/MF A01

The trends in high temperature parts maintenance concept developments are reviewed, indicating the constant activities to optimize the maintenance cost of the propulsion system. As a result of the escalating trends in material and fuel prices, the presently applied maintenance concepts require a more sophisticated condition control in order to comply with the need to find the optimum operating time of each individual engine. With the introduction of the new generation of civil aircraft (Airbus A310) a mutual goal between the engine manufacturer and the airline was defined to develop mathematical programs, based on actual recorded conditions, in order to control the behavior of the engine, aiming at an optimum use of the propulsion system. GTD ANALYSIS OF AIRBORNE ANTENNAS RADIATING IN THE PRESENCE OF LOSSY DIELECTRIC LAYERS Semiannual Report

R. G. Rojas-Teran and W. D. Burnside Aug. 1981 113 p refs
(Grant NsG-1498)
(NASA-CR-168770; NAS 1.26:168770; ESL-710964-8) Avail: NTIS HC A06/MF A01 CSCL 20N

The patterns of monopole or aperture antennas mounted on a perfectly conducting convex surface radiating in the presence of a dielectric or metal plate are computed. The geometrical theory of diffraction is used to analyze the radiating system and extended here to include diffraction by flat dielectric slabs. Modified edge diffraction coefficients valid for wedges whose walls are lossy or lossless thin dielectric or perfectly conducting plates are developed. The width of the dielectric plates cannot exceed a quarter of a wavelength in free space, and the interior angle of the wedge is assumed to be close to 0 deg or 180 deg. Systematic methods for computing the individual components of the total high frequency field are discussed. The accuracy of the solutions is demonstrated by comparisons with measured results, where a 2 lambda by 4 lambda prolate spheroid is used as the convex surface. A jump or kink appears in the calculated pattern when higher order terms that are important are not included in the final solution. The most immediate application of the results presented here is in the modelling of structures such as aircraft which are composed of nonmetallic parts that play a significant role in the pattern. PROTOTYPE FLYWHEEL SPIN TESTING PROGRAM Final Report, 21 Mar. 1980 - 15 Apr. 1981

D. W. Rabenhorst and W. O. Wilkinson Apr. 1981 59 p refs
Prepared for California Univ., Livermore. Lawrence Livermore Lab.
(Contract W-7405-eng-48)
(UCRL-15381; SDO-5988) Avail: NTIS HC A04/MF A01

Flywheels were spin tested to determine for each flywheel (1) the rotational speed at flywheel failure and (2) within the capability of the facility, the initiation and mode of failure of the flywheel. The flywheel tested ranged in size from 12.0 to 24.0 inches diameter; in weight from 5.0 to 28.5 pounds, and in energy at failure up to 711 watt hours. M.D.K.

CALCULATION OF THE CONTRIBUTIONS OF AIR TRAFFIC AND ROAD TRAFFIC TO AIR POLLUTION IN THE REGION OF SCHIPHOL AIRPORT IN 1974

J. J. Tiggelaar Oct. 1981 51 p refs In DUTCH; ENGLISH summary Sponsored by Netherlands Ministerie van Volksgezondheid en Milieuhygiene
(NLR-TR-77100-U) Avail: NTIS HC A04/MF A01

Annual and quarterly averages of CO, NOx and CxHy concentrations in the Schiphol airport region are calculated using a mathematical model. The method models traffic into a set of line and point sources with constant emission. For CO and NOx the road traffic contribution to air pollution is largest, while for CxHy the air traffic contribution is largest. The measurements suggest that other sources contribute at least as much to global air pollution as do road and air traffic. Author (ESA)

THE ROLE OF COHERENT STRUCTURES IN THE GENERATION OF NOISE FOR SUBSONIC JETS Yearly Progress Report, 1 Nov. 1980 - 31 Oct. 1981

Gerald L. Morrison 5 Apr. 1982 109 p refs
(Grant NAG1-112)
(NASA-CR-168764; NAS 1.26:168764) Avail: NTIS HC A06/MF A01 CSCL 20A

The coherent structure in high Reynolds number (184,000 to 262,000), Mach number 0.6 to 0.8 axisymmetric cold air jets exhausting at atmospheric pressure was studied. The mean flow and the statistical time averaged turbulence properties were measured. Spectra showed a very broad frequency content which shifted towards the lower frequencies as the flow progressed downstream. Axial wave number measurements indicate that the axial wave number-frequency relationship was the same for a wide range of Mach (0.3 to 2.5) and Reynolds (3,700 to over 200,000) numbers. Measurements of the azimuthal mode numbers show that several modes from n = -3 to +3 exist simultaneously in various quantities that the different frequencies studied. Acoustic measurements were made in the near field of the Mach number 0.6 jet. Sound pressure level contours showed that noise appeared to be radiated from a location near the end of the potential core. Directivity plots revealed that the spectra of this noise shifted towards higher frequencies as the angle from the jet axis increased. It was also found that mid-band excitation frequencies produced an increase in full spectrum noise. M.G.

PROGRAM FOR NARROW-BAND ANALYSIS OF AIRCRAFT FLYOVER NOISE USING ENSEMBLE AVERAGING TECHNIQUES

Doreen Gridley Mar. 1982 70 p refs
(Contract NAS1-16000)
(NASA-CR-165867; NAS 1.26:165867) Avail: NTIS HC A04/MF A01 CSCL 20A

A package of computer programs was developed for analyzing acoustic data from an aircraft flyover. The package assumes the aircraft is flying at constant altitude and constant velocity in a fixed attitude over a linear array of ground microphones. Aircraft position is provided by radar and an option exists for including the effects of the aircraft's rigid-body attitude relative to the flight path. Time synchronization between radar and acoustic recording stations permits ensemble averaging techniques to be applied to the acoustic data thereby increasing the statistical accuracy of the acoustic results. Measured layered meteorological data obtained during the flyovers are used to compute propagation effects through the atmosphere. Final results are narrow-band spectra and directivities corrected for the flight environment to an equivalent static condition at a specified radius. R.J.F.

ANALYTICAL PREDICTION OF THE INTERIOR NOISE FOR CYLINDRICAL MODELS OF AIRCRAFT FUSELAGES FOR PRESCRIBED EXTERIOR NOISE FIELDS. PHASE 2: MODELS FOR SIDEWALL TRIM, STIFFENED STRUCTURES AND CABIN ACOUSTICS WITH FLOOR PARTITION

L. D. Pope and E. G. Wilby Apr. 1982 212 p refs
(Contract NAS1-15782)
(NASA-CR-165869; NAS 1.26:165869) Avail: NTIS HC A10/MF A01 CSCL 20A

An airplane interior noise prediction model is developed to determine the important parameters associated with sound transmission into the interiors of airplanes, and to identify apropriate noise control methods. Models for stiffened structures, and cabin acoustics with floor partition are developed. Validation studies are undertaken using three test articles: a ring stringer stiffened cylinder, an unstiffened cylinder with floor partition,

and ring stringer stiffened cylinder with floor partition and sidewall trim. The noise reductions of the three test articles are computed using the theoretical models and compared to measured values. A statistical analysis of the comparison data indicates that there is no bias in the predictions although a substantial random error exists so that a discrepancy of more than five or six dB can be expected for about one out of three predictions.

AERODYNAMIC NOISE GENERATED BY JET-WING/FLAP INTERACTIONS OF THE EXTERNAL USB CONFIGURATION OF STOL AIRCRAFT. PART 1: EIGHT PERCENT SCALE COLD-FLOW MODEL ANALYSIS

Masatcka Maita and Shigemi Shindo Oct. 1981 29 p refs (NAL-TR-685T; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

The acoustic characteristics of the external upper surface blowing (USB) concept of a powered high lift system (PHLS) were studied experimentally using an 8%-scale static cold flow model. Observations of exhaust jet flow attachment and spreading characteristics on wing/flap surface were also carried out using several flow visualization techniques. Noise reduction data were obtained by optimizing basic jet nozzle wing/flap structural geometries for the lowest noise. Among the associated parameters which define USB-PHLS configurations, (1) the location relative to wing/flap and the shape of the exhaust jet nozzle and (2) flow attachment devices are important parameters. Flow characteristics dependence on these parameters and PHLS noise were also obtained. From far field noise spectra overall sound pressure level dependence on jet velocity and coherence across near field surface pressure, it was concluded tht the flap trailing edge noise was the most predominant noise source. Several acoustically treated flaps and serrated trailing edge design techniques were applied to attenuate edge noise.

RECOMMENDATIONS FOR FIELD MEASUREMENTS OF AIRCRAFT NOISE Final Report

Alan H. Marsh Washington NASA Apr. 1982 94 p refs (NASA-CR-3540; NAS 1.26:3540) Avail: NTIS HC A05/MF A01 CSCL 20A

Specific recommendations for environmental test criteria, data acquisition procedures, and instrument performance requirements for measurement of noise levels produced by aircraft in flight are provided. Recommendations are also given for measurement of associated airplane and engine parameters and atmospheric conditions. Recommendations are based on capabilities which were available commercially in 1981; they are applicable to field tests of aircraft flying subsonically past microphones located near the surface of the ground either directly under or to the side of a flight path. Aircraft types covered by the recommendations include fixed-wing airplanes powered by turbojet or turbofan engines or by propellers. The recommended field-measurement procedures are consistent with assumed requirements for data processing and analysis.

ACOUSTIC EMISSION FROM FREE JETS

S.-L. Hall *In* Ecole Centrale de Lyon Euromech 142: Acoustics of Turbulent Flows 1981 4 p

Avail: NTIS HC A08/MF A01

Nozzle centered radiation, wider spaced waves, and low angle waves are seen in correctly expanded supersonic jets. In working conditions, shock jet interaction, resulting from incorrect expansion, generates additional high frequency noise. Underexpanded jets emit more noise than overexpanded jets, due to operating at higher Mach numbers and oscillations of the shock cells. Shadowgraphs and Schlieren photographs show that helium jets have larger angles and greater extent of noise radiation than air jets. Mathematical models for correctly expanded supersonic air jets exhausting into the quiescent atmosphere, given no extraneous shocks near the nozzle exit, calculate acoustic wave angles to within 3 deg of measured values. Similar accuracy is achieved for helium jets when the ratio of acoustic impedances is used to correct the air jet values for refraction and convection effects. Models give reasonably good prediction of wave angles from + or - 50% of the correct expansion. For jets without extraneous shocks, when correctly expanded, calculated angles are within 4 deg of measured values.

PREDICTION OF FLYOVER JET NOISE SPECTRA FROM STATIC TESTS

Ulf Michel and Alfons Michalke (Technische Univ., Berlin) *In* Ecole Centrale de Lyon Euromech 142: Acoustics of Turbulent Flows 1981 4 p refs

Avail: NTIS HC A08/MF A01

A scaling law for predicting the overall flyover noise of a single stream shock-free circular jet from static experiments is outlined. It is valid for isothermal and hot jets. It assumes that the jet flow and turbulence field are axially stretched in flight. Effects of the boundary layer within the nozzle and along the engine nacelle are neglected. The scaling laws for the power spectral density and spectra with constant relative bandwidth can be derived. In order to compare static and inflight directivities, the far field point relative to the source position must be denoted by the emission angle and the wave normal distance. From the solution of the convective Lighthill equation in a coordinate system fixed to the jet nozzle (wind tunnel case), the power spectral density of sound pressure at a given frequency is found. Predictions for Aerotrain compare well with measured values.

AIRCRAFT AERODYNAMIC NOISE DURING APPROACH [BRUIT AERODYNAMIQUE DES AVIONS EN APPROCHE]

J. L. Parent *In* Ecole Centrale de Lyon Euromech 142: Acoustics of Turbulent Flows 1981 3 p In FRENCH

Avail: NTIS HC A08/MF A01

The effect of approach velocity, nose and flap inclination, and undercarriage position on aircraft noise was studied. The A 300 B and SN 601 aircraft made two approach passes over a chain of noise recorders. The sound fields and noise spectra show that increasing the speed and flap angle or lowering the undercarriage produces a general increase in noise level such that the directivity of the aerodynamic noise source is hardly changed. All noise spectra increase. Pure frequencies (400 to 500 Hz) accompany flap deployment for the SN 601.

EXPERIMENTS ON PROPELLER NOISE

F. R. Grosche and H. Stiewitt *In* Ecole Centrale de Lyon Euromech 142: Acoustics of Turbulent Flows 1981 4 p refs

Avail: NTIS HC A08/MF A01

Propeller sound generation was investigated. Tests were performed at flow velocities up to 58 m/sec on 90 cm dia. four bladed propellers driven by an electric motor enclosed in a streamlined nacelle. Five models with different blade geometries were tested at helical tip Mach numbers up to 0.69. Nearfield blade tip measurements were made at 0.14 dia. by an in-flow microphone. The acoustic far field was measured by four microphones outside the wind tunnel flow 2.7 m from the propeller axis. An acoustic mirror telescope with three microphones was used to investigate sound generation from the upper, central and lower parts of the propeller. The spectrum in the propeller plane is dominated by the tonal components at the blade passing frequency and its harmonics. Tonal component amplitude is greatly reduced downstream. The blades radiate high frequency noise mainly in motion direction.

Application of a transonic potential flow code to the static aeroelastic analysis of three-dimensional wings [AIAA 82-0689] A82-30156
Analysis of aircraft dynamic behavior in a crash environment [AIAA 82-0694] A82-30161
Flutter analysis using nonlinear aerodynamic forces. [AIAA 82-0728] A82-30176
Component coupling with time-invariant mass matrix for nonisotropic rotating and nonrotating systems [AIAA 82-0731] A82-30179
On the dynamic collapse of a column impacting a rigid surface [AIAA 82-0735] A82-30182
Application of a transonic potential flow code to the static aeroelastic analysis of three-dimensional wings [NASA-TM-83296] N82-23193
Historical perspectives on thermostructural research at the NACA Langley Aeronautical Laboratory from 1948 to 1958 N82-23494

DYNAMIC TESTS
Dynamic qualification testing of F-16 equipment N82-22159
The dynamic qualification of equipment and external stores for use with rotary winged aircraft N82-22167

E

EARLY WARNING SYSTEMS
Sea-based remotely piloted vehicles. I - Issues and concepts A82-29714

ECONOMIC FACTORS
Adaptation and equipment of aircraft for the fighting of forest fires A82-29584
Air Traffic Flow Management and Air Traffic Flow Control A82-29923

EFFECTIVE PERCEIVED NOISE LEVELS
Comparing the relationships between noise level and annoyance in different surveys - A railway noise vs. aircraft and road traffic comparison A82-29465

EFFECTIVENESS
The assessment of aircraft combat effectiveness using a new computational method N82-22203
Influence of maneuverability on helicopter combat effectiveness N82-23212

EJECTORS
Fluid dynamics of jets with applications to V/STOL [AGARD-CP-308] N82-23150
Thrust augmenting ejectors: A review of the application of jet mechanics to V/STOL aircraft propulsion N82-23169
Theoretical optimisation and experimental verification of an injector N82-23170
Unsteady ejectors N82-23171
Improvement of ejector thrust augmentation by pulsating or flapping jets N82-23172
Turboprop and turbojet ejector optimisation N82-23174

ELASTIC BENDING
The stability of monocoque panels under bending A82-29436

ELASTIC MEDIA
Elastic suspension of a wind tunnel test section N82-23363

ELASTIC PROPERTIES
Unsteady pressure measurements at stall and buffeting [DFVLR-MITT-79-09] N82-23198

ELECTRIC PULSES
Transient measurements under electric pulse excitation in 37 Viggen aircraft [FOA-C-30243-A3] N82-23409

ELECTRONIC RECORDING SYSTEMS
Development of a taped random vibration technique for acceptance testing N82-22171

ELECTRONIC WARFARE
Sea-based remotely piloted vehicles. I - Issues and concepts A82-29714

ELEVATORS (CONTROL SURFACES)
Elevator unit for the Alpha-Jet, made from carbon-fibre reinforced plastic A82-28649

ENERGY CONVERSION EFFICIENCY
Energy efficient engine exhaust mixer model technology [NASA-CR-165459] N82-22264

ENERGY POLICY
Fuel efficiency engines for large transport aircraft [PNR-90082] N82-22276

ENGINE AIRFRAME INTEGRATION
Advanced general aviation engine/airframe integration study [NASA-CR-165565] N82-22260

ENGINE CONTROL
Determination of an optimal control program for an aircraft power plant during climb A82-29845
A helicopter handling-qualities study of the effects of engine response characteristics, height-control dynamics, and excess power on nap-of-the-Earth operations N82-23214

ENGINE DESIGN
The gas turbine engine A82-28587
Sheet materials - Fabrication and joining --- for gas turbine engine components A82-28594
Future auto engines - Competition heats up A82-29793
Gas turbine engines used in aviation: Design and construction of components /5th revised and enlarged edition/ --- Russian book A82-30697
The role of modern control theory in the design of controls for aircraft turbine engines [NASA-TM-82815] N82-22262
Energy efficient engine exhaust mixer model technology [NASA-CR-165459] N82-22264
RB211 powerplant deterioration: Review of current situation and lessons learned [PNR-90073] N82-22270
Development of a correlated finite element dynamic model of a complete aero engine [PNR-90081] N82-22272
Parametric study of the influence of the engine upon the operating cost of a civil helicopter [SNIAS-827-210-102] N82-22273
Reliable power --- RB211 aircraft engines [PNR-90078] N82-22275
Fuel efficiency engines for large transport aircraft [PNR-90082] N82-22276
Alternatives for jet engine control [NASA-CR-168894] N82-23247
Advanced turbine study --- airfoil coling in rocket turbines [NASA-CR-162003] N82-23249

ENGINE FAILURE
Computer modeling of fan-exit-splitter spacing effects on F100 response to distortion [NASA-CR-167079] N82-23246

MECHANICAL PROPERTIES
Composite materials --- with emphasis for aircraft gas turbine parts
A82-28590
Processing and uses of carbon fibre reinforced plastics --- Book
A82-28643
Effects of moisture on the mechanical properties of glass/epoxy composites
A82-29036
A review of U.S. Air Force research related to airframe and engine materials
A82-29268
Mechanical properties of a fiberglass prepreg system at cryogenic and other temperatures
[AIAA 82-0708] A82-30099
Environmental and high strain rate effects on composites for engine applications
[AIAA 82-0758] A82-30118
Effect of operating life on the mechanical properties of the materials and load-bearing capacity of the rotor elements of gas-turbine engines
A82-31643
The influence of protective treatment on the mechanical properties of superalloy parts
N82-22180

METAL CUTTING
Tool use in cutting operations involving integral structural components in aircraft construction
A82-28873

METAL FATIGUE
Occurrence of fretting fatigue failures in practice
A82-28543
Some case studies and the significance of fatigue thresholds --- aircraft components
[NLR-MP-81015-U] N82-23561

METAL JOINTS
Sheet materials - Fabrication and joining --- for gas turbine engine components
A82-28594

METAL PLATES
GTD analysis of airborne antennas radiating in the presence of lossy dielectric layers
[NASA-CR-168770] N82-22398

METAL SHEETS
Sheet materials - Fabrication and joining --- for gas turbine engine components
A82-28594

METAL WORKING
SPF of high strength aluminum structures --- superplastic forming for complex aircraft structures
A82-28997

METAL-METAL BONDING
Structural integrity of an adhesively bonded aircraft fuselage
A82-28996

METALS
Critical metals conservation, recycling and substitution
[AGARD-R-693] N82-22348

METEOROLOGICAL INSTRUMENTS
Instruments and installations for meteorological measurements at airports --- Russian book
A82-28826

METHANE
NOx formation in flat, laminar, opposed jet methane diffusion flames
A82-28660

MICROPROCESSORS
The micro revolution comes to civil air transport
A82-29259

MILITARY AIRCRAFT
A computerized system for the application of fracture tracking data to aircraft management for the C-5A military airlift transport
[AIAA 82-0760] A82-30119
Durability and damage tolerance control plans for USAF aircraft
[AIAA 82-0679] A82-30147

MILITARY HELICOPTERS
The structural dynamic interface required for developing helicopter target acquisition systems
N82-22165
Naval versions of the Dauphin and the AS 15 TT weapon system --- helicopters
[SNIAS-821-210-104] N82-22255
Controls and displays for all-weather operation of helicopters
[MBB-UD-319-81-O] N82-22260
The integration of multiple avionic sensors and technologies for future military helicopters
N82-23186
VTOL and VSTOL handling qualities specifications, an overview of the current status
N82-23209
Civil (French/US) certification of the Coast Guard's HH-65A Dauphin
N82-23210
Influence of maneuverability on helicopter combat effectiveness
N82-23212
Definition of display/control requirements for assault transport night/adverse weather capability
N82-23217
Some piloting experiences with multifunction isometric side-arm controllers in a helicopter
N82-23218
Results of NASA/FAA ground and flight simulation experiments concerning helicopter IFR airworthiness criteria
N82-23219
State-of-the-art cockpit design for the HH-65A helicopters
N82-23220
Performance evaluation of a kinesthetic-tactual display
N82-23221
Synthesis of an integrated cockpit management system
N82-23222
The role of voice technology in advanced helicopter cockpits
N82-23223
Cockpit integration from a pilot's point of view
N82-23224

MILITARY TECHNOLOGY
V/STOL aircraft and fluid dynamic
N82-23179

MISSILE BODIES
Research and development at MBB. Technical and scientific publications, 1981
N82-23137

MISSILE CONTROL
Optimal control and estimation for strapdown seeker guidance of tactical missiles
A82-31121

MISSILE DESIGN
Approximate method for predicting supersonic normal force coefficient very-low-aspect-ratio lifting surfaces
[AD-A111770] N82-23199

MISSILE SYSTEMS
Naval versions of the Dauphin and the AS 15 TT weapon system --- helicopters
[SNIAS-821-210-104] N82-22255

MIXING LENGTH FLOW THEORY
Thrust augmenting ejectors: A review of the application of jet mechanics to V/STOL aircraft propulsion
N82-23169
Unsteady ejectors
N82-23171
Improvement of ejector thrust augmentation by pulsating or flapping jets
N82-23172

MODAL RESPONSE
A complete method for computation of blade mode characteristics and responses in forward flight
[SNIAS-821-210-101] N82-22254

MOISTURE CONTENT
Effects of moisture on the mechanical properties of glass/epoxy composites
A82-29036

MOLECULAR RELAXATION
Numerical study of vibrational relaxation in the turbulent mixing of jets in a supersonic nozzle
A82-29880

MOTOR VEHICLES
Calculation of the contributions of air traffic and road traffic to air pollution in the region of Schiphol airport in 1974
[NLR-TR-77100-U] N82-22808

MRCA AIRCRAFT
Qualification of equipment for gunfire induced vibration
N82-22158

N

NACELLES
Effect of nacelles on aerodynamic characteristics of an executive-jet model with simulated, partial-chord, laminar-flow-control wing glove
[NASA-TM-83271] N82-22217
RB211 powerplant deterioration: Review of current situation and lessons learned
[PNR-90073] N82-22270
Development of a correlated finite element dynamic model of a complete aero engine
[PNR-90081] N82-22272
Automated design of minimum drag light aircraft fuselages and nacelles
[NASA-CR-168913] N82-23238
Development of a convoluted intake seal for model R66 --- v/stol wind tunnel
[BAE-ARG-163] N82-23255

MAP-OF-THE-EARTH NAVIGATION
Helicopter Handling Qualities
[NASA-CP-2219] N82-23208
Flight tests for the assessment of task performance and control activity
N82-23213
A helicopter handling-qualities study of the effects of engine response characteristics, height-control dynamics, and excess power on nap-of-the-Earth operations
N82-23214
Unified results of several analytical and experimental studies of helicopter handling qualities in visual terrain flight
N82-23215
An assessment of various side-stick controller/stability and control augmentation systems for night nap-of-Earth flight using piloted simulation
N82-23216

NASA PROGRAMS
The 1983 NASA Authorization, Volume 1
[GPO-91-488-VOL-1] N82-23068

NAVIGATION
Analysis of computing system configurations for highly integrated guidance and control systems
N82-23189

NAVIGATION INSTRUMENTS
Magnetic anomalies as a reference for ground-speed and map-matching navigation
A82-30314

NAVSTAR SATELLITES
The helicopter Navstar GPS test program
A82-31290

NAVY
Sea-based remotely piloted vehicles. I - Issues and concepts
A82-29714

NICKEL ALLOYS
The gas turbine engine
A82-28587
An evaluation study of aluminide and chromoaluminide coatings on IN-100
A82-29597
Directional solidification: Project B2 --- of gas turbine rotor blade alloys
[PNR-90088] N82-22279

NIGHT FLIGHTS (AIRCRAFT)
A light helicopter for night firing
[SNIAS-821-210-105] N82-22256
Helicopter Handling Qualities
[NASA-CP-2219] N82-23208
An assessment of various side-stick controller/stability and control augmentation systems for night nap-of-Earth flight using piloted simulation
N82-23216

NIGHT VISION
Definition of display/control requirements for assault transport night/adverse weather capability
N82-23217

NITROGEN OXIDES
The effect of swirl burner aerodynamics on NOx formation
A82-28658
NOx formation in flat, laminar, opposed jet methane diffusion flames
A82-28660

NOISE MEASUREMENT
The role of coherent structures in the generation of noise for subsonic jets
[NASA-CR-168764] N82-22947
Program for narrow-band analysis of aircraft flyover noise using ensemble averaging techniques
[NASA-CR-165867] N82-22949
Recommendations for field measurements of aircraft noise
[NASA-CR-3540] N82-22955
An investigation of rotor harmonic noise by the use of small scale wind tunnel models
[NASA-CR-166337] N82-24050

NOISE PREDICTION (AIRCRAFT)
STOL aircraft structural vibration prediction from acoustic excitation
N82-22169
Analytical prediction of the interior noise for cylindrical models of aircraft fuselages for prescribed exterior noise fields. Phase 2: Models for sidewall trim, stiffened structures and cabin acoustics with floor partition
[NASA-CR-165869] N82-22952
Prediction of flyover jet noise spectra from static tests
N82-22963

NOISE PROPAGATION
Experiments on propeller noise
N82-22978

NOISE SPECTRA
The role of coherent structures in the generation of noise for subsonic jets
[NASA-CR-168764] N82-22947
Program for narrow-band analysis of aircraft flyover noise using ensemble averaging techniques
[NASA-CR-165867] N82-22949
Prediction of flyover jet noise spectra from static tests
N82-22963

NOISE TOLERANCE
Comparing the relationships between noise level and annoyance in different surveys - A railway noise vs. aircraft and road traffic comparison
A82-29165

NONDESTRUCTIVE TESTS
Utility of a probability-density-function curve and F-maps in composite-material inspection
A82-28934
On the characterization of damages in graphite-epoxy composites
[AIAA 82-0757] A82-30117
Comparison of reliability, sensitivity and accuracy of some NDI-Techniques
[NLR-MP-80039-U] N82-23542

NONLINEAR SYSTEMS
Flutter analysis using nonlinear aerodynamic forces
[AIAA 82-0728] A82-30176
Application of the theory of bifurcations to the study of the loss of control in combat aircraft
N82-22198
An analysis of a nonlinear instability in the implementation of a VTOL control system
[NASA-TM-84220] N82-22281

NOZZLE FLOW
Application of computer generated color graphic techniques to the processing and display of three dimensional fluid dynamic data --- for turbofan mixer nozzle mixing process analysis
A82-29006
Some aspects of jet dynamics and their implications for VTOL research
N82-23151

NOZZLE GEOMETRY
Aerodynamic analysis of VTOL inlets and definition of a short, blowing-lip inlet
[NASA-CR-165617] N82-22211
Experimental study of a jet deflector
N82-23173

NOZZLE THRUST COEFFICIENTS
Wind-tunnel investigation of the powered low-speed longitudinal aerodynamics of the Vectored-Engine-Over (VEO) wing fighter configuration
[NASA-TM-83263] N82-22207

NUMERICAL CONTROL
A computer-controlled oscillation mechanism for unsteady aerodynamics experiments
A82-29018

Test demonstration of digital control of wing/store flutter
[AIAA 82-0645] A82-30141

NUMERICAL FLOW VISUALIZATION
Application of computer generated color graphic techniques to the processing and display of three dimensional fluid dynamic data --- for turbofan mixer nozzle mixing process analysis
A82-29008

NUMERICAL INTEGRATION
A Schwarz-Christoffel method for generating internal flow grids
A82-29005

O

OBSTACLE AVOIDANCE
Integrated navigation-TF/TA-system based on stored terrain data processing
N82-23183

ON-LINE SYSTEMS
Evaluation of four subcritical response methods for on-line prediction flutter onset in wind-tunnel tests --- conducted in the Langley Transonic Dynamics Tunnel
[NASA-TM-83278] N82-23240

OPERATORS (PERSONNEL)
A theory of human error
[NASA-CR-166313] N82-22250

OPTICAL GYROSCOPES
Laser gyros - The guiding light
A82-29792

OPTIMAL CONTROL
Determination of an optimal control program for an aircraft power plant during climb
A82-29845
Application of optimal control techniques to aircraft flutter suppression and load alleviation
[AIAA 82-0724] A82-30173
Optimal control and estimation for strapdown seeker guidance of tactical missiles
A82-31121
Multivariable closed loop control analysis and synthesis for complex flight systems
N82-22193

OPTIMIZATION
Optimization of measurements in the state estimation of systems using the least squares method
A82-29826
Design principles of a computer-aided design system
A82-29829
Shape optimization of fiber reinforced composites
[AIAA 82-0719] A82-30169
A linear decomposition method for large optimization problems. Blueprint for development
[NASA-TM-83248] N82-22245

OSCILLATING FLOW
The relaxation oscillation in ramjet combustion
A82-28738

OSCILLATIONS
Comparison of analytical predictions of longitudinal short period pilot-induced oscillations with results from a simulation study of the space shuttle orbiter
[NASA-TM-83267] N82-23236

OZONOMETRY
Aircraft cabin air ozone contamination and compliance with regulations
A82-31057

P

PANEL METHOD (FLUID DYNAMICS)
Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method
[AIAA PAPER 82-0727] A82-30193

PANELS
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-165841] N82-22316

PARABOLIC BODIES
Helicopter rotor performance improvement by utilization of swept-back parabolic blade tip --- wind tunnel tests
N82-22151

PARACHUTE DESCENT
The stressed state of a parachute canopy during opening
A82-29820

PARAMETER IDENTIFICATION
Analytical prediction of the interior noise for cylindrical models of aircraft fuselages for prescribed exterior noise fields. Phase 2: Models for sidewall trim, stiffened structures and cabin acoustics with floor partition
[NASA-CR-165869] N82-22952
Analysis and Monte Carlo simulation of near-terminal aircraft flight paths
[NASA-TP-1997] N82-23233

PAVEMENTS
Pavement management and rehabilitation of portland cement concrete pavements
[PB82-131384] N82-22392

PERFORMANCE PREDICTION
Prediction of aerodynamically induced vibrations in turbomachinery blading
A82-28986
Estimation of the performance of nonstationary discontinuous control systems for flight vehicles
A82-29832

PERFORMANCE TESTS
Tail rotor studies for satisfactory performance: Strength and dynamic behavior
[SNIAS-821-210-108] N82-22258
Production Verification Testing (PVT) of guidance and control systems for high reliability
N82-23107

PILOT ERROR
Functional requirements for the man-vehicle systems research facility --- identifying and correcting human errors during flight simulation
[NASA-CR-166315] N82-22248
A theory of human error
[NASA-CR-166313] N82-22250

PILOT PERFORMANCE
Enhanced piloting control through cockpit facilities and A.C.T.
N82-22195
Technical approaches for measurement of human errors
[NASA-CR-166314] N82-22249
Flight tests for the assessment of task performance and control activity
N82-23213

PILOT TRAINING
Evaluation of aircraft in simulated combat: Computer against computer or computer against human pilot
N82-22202

PISTON ENGINES
Advanced general aviation comparative engine/airframe integration study
[NASA-CR-165564] N82-22263

PITCHING MOMENTS
A two-degree-of-freedom flutter mount system with low damping for testing rigid wings at different angles of attack
[NASA-TM-83302] N82-23549

PLASTIC AIRCRAFT STRUCTURES
Addition polyimide adhesives containing various end groups
A82-29098
On the characterization of damages in graphite-epoxy composites
[AIAA 82-0757] A82-30117
A giant step toward composite helicopters
A82-30294

PNEUMATIC EQUIPMENT
Drag reduction using pneumatic turbulators --- laminar airfoils
[DFVLR-FB-81-33] N82-22223

POLICIES
Developmental possibilities and restrictions in air transport
[DFVLR-MITT-81-9] N82-22229

POLLUTION MONITORING
Aircraft cabin air ozone contamination and compliance with regulations
A82-31057

POLYIMIDE RESINS
Addition polyimide adhesives containing various end groups
A82-29098

POLYMER MATRIX COMPOSITES
Damping and stiffness of aligned discontinuous fiber reinforced polymer composites
[AIAA 82-0732] A82-30182
POSITION ERRORS
The reliability of height and identity data --- secondary surveillance radar error analysis
A82-30312
POTENTIAL FLOW
Application of a transonic potential flow code to the static aeroelastic analysis of three-dimensional wings
[AIAA 82-0689] A82-30156
Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method
[AIAA PAPER 82-0727] A82-30193
Application of a transonic potential flow code to the static aeroelastic analysis of three-dimensional wings
[NASA-TM-83296] N82-23193
An accurate method for evaluating the kernel of the integral equation relating lift to downwash in unsteady potential flow
[NASA-TM-83281] N82-23194
POWDER METALLURGY
Development of low-cost titanium structures using blended elemental powder metallurgy
A82-28990
Powder metallurgical innovations for improved hot section alloys in aero-engine applications
[PNR-90072] N82-22358
POWER EFFICIENCY
Analysis of changes in the gas-dynamic parameters of a gas-turbine helicopter engine during acceleration
A82-29872
POWERED MODELS
Development of a convoluted intake seal for model N66 --- v/stol wind tunnel
[BAE-ARG-163] N82-23255
PREDICTION ANALYSIS TECHNIQUES
New processes and methods of technical diagnostics and prognostics in the case of the engine NK-8-4. II
A82-29925
Gunfire blast pressure predictions
N82-22170
Predictions of aerodynamic characteristics of highly maneuverable configurations
N82-22199
PREDICTIONS
Evaluation of four subcritical response methods for on-line prediction flutter onset in wind-tunnel tests --- conducted in the Langley Transonic Dynamics Tunnel
[NASA-TM-83278] N82-23240
PREPREGS
Mechanical properties of a fiberglass prepreg system at cryogenic and other temperatures
[AIAA 82-0708] A82-30099
PRESSURE DISTRIBUTION
Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method
[AIAA PAPER 82-0727] A82-30193
A flight investigation of blade-section aerodynamics for a helicopter main rotor having RC-SC2 airfoil sections
[NASA-TM-83298] N82-23192
PRESSURE DRAG
An experimental and theoretical investigation of the interaction between the engine jet and the surrounding flow field with regard to the pressure drag on afterbodies
N82-23158
PRESSURE GRADIENTS
Static and unsteady pressure measurements on a 50 degree clipped delta wing at M = 0.9 --- conducted in the Langley Transonic Dynamics Tunnel
[NASA-TM-83297] N82-23195
PRESSURE MEASUREMENT
Pressure measurements on twin vertical tails in buffeting flow
[AIAA 82-0641] A82-30138
Static and unsteady pressure measurements on a 50 degree clipped delta wing at M = 0.9
[AIAA 82-0686] A82-30153
PRESSURE PULSES
The oscillation of compressor/duct systems
A82-[illegible]
PRESSURE RATIO
Performance of single-stage axial-flow transonic compressor with rotor and stator aspect ratios of 1.63 and 1.77, respectively, and with design pressure ratio of 2.05
[NASA-TP-2001] N82-22[illegible]
PROBABILITY DENSITY FUNCTIONS
Utility of a probability-density-function curve and F-maps in composite-material inspection
A82-28[illegible]
PROBLEM SOLVING
A complete method for computation of blade mode characteristics and responses in forward flight
[SNIAS-821-210-101] N82-22254
PRODUCT DEVELOPMENT
Collaborative development of aero-engines
[PNR-90083] N82-22277
PRODUCTION ENGINEERING
Applications of structural adhesives in production
A82-[illegible]
Directional solidification: Project 82 --- UK gas turbine rotor blade alloys
[PNR-90080] N82-22279
PROGNOSIS
Developmental possibilities and restrictions in air transport
[DFVLR-MITT-81-9] N82-22226
Developmental possibilities in civil aviation in the Federal Republic of Germany
N82-22230
PROJECT MANAGEMENT
A system safety model for developmental aircraft programs
[NASA-CR-3534] N82-[illegible]
PROPELLANT EXPLOSIONS
Gunfire blast pressure predictions
N82-22170
PROPELLER BLADES
A flight investigation of blade-section aerodynamics for a helicopter main rotor having RC-SC2 airfoil sections
[NASA-TM-83298] N82-23192
PROPELLER DRIVE
Ground reflection effects in measuring propeller aircraft flyover noise
[DFVLR-FB-81-28] N82-[illegible]
PROPELLER FANS
Fuel efficient and Mach 0.8, too
A82-[illegible]
New processes and methods of technical diagnostics and prognostics in the case of the engine NK-8-4. II
A82-29925
PROPELLERS
Experiments on propeller noise
N82-[illegible]
PROPRIOCEPTION
A tactual display aid for primary flight training
[NASA-CR-166242] N82-[illegible]
PROPULSION
Jet V/STOL wind-tunnel simulation and groundplane effects
N82-[illegible]
PROPULSION SYSTEM CONFIGURATIONS
The role of modern control theory in the design of controls for aircraft turbine engines
[NASA-TM-82815] N82-[illegible]
PROPULSION SYSTEM PERFORMANCE
NASA/FAA Advanced Rotorcraft Technology and Tilt Rotor Workshop. Volume 5: Propulsion Session
[NASA-TM-84207] N82-[illegible]
PROTECTIVE COATINGS
An evaluation study of aluminide and chromoaluminide coatings on IN-100
A82-[illegible]
The influence of protective treatment on the mechanical properties of superalloy parts
N82-[illegible]

Q

QUALIFICATIONS
Development and use of dynamic qualification standards for Air Force stores
N82-[illegible]

BALL, R. E.
Checking and calibrating variometers in place in the sailplane instrument panel
A82-29415
BARNES, A. G.
The study of combat aircraft maneuverability by air to air combat simulation
N82-22205
BARNHART, B.
Analysis of rotary balance data for the F-15 airplane including the effect of conformal fuel tanks
[NASA-CR-3479] N82-22213

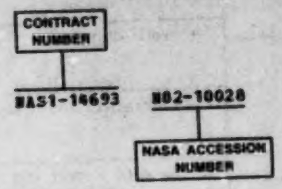
CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 151)* AUGUST 1982

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

A82-31980 # **The potential of large aircraft.** G. D. Brewer (Lockheed-California Co., Burbank, CA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0804.* 6 p.

The present investigation is concerned with two designs of unconventional aircraft, both very much larger than existing equipment. One of the two designs, implemented by the Surface Effect Aircraft (SEA), takes advantage of the increase in lift/drag (L/D) which results from flying very close to the surface. In connection with their size, the vehicles were designed to operate as flying boats. It was recognized that their principal operational mode would be in transocean service, providing '125 knot sea lift'. At a takeoff gross weight of 1.8 million pounds one of the considered SEA is capable of carrying 810,000 pounds of payload a distance of 3450 nautical miles. Attention is also given to a study regarding the largest aircraft anyone might conceivably build, taking into account the conceptual design of a nuclear-powered aircraft which weighed nearly 12 million pounds. A military situation was conceived in which such aircraft might be used. G.R.

A82-31981 # **Aircraft carrier - Surface effect ship.** D. P. Germeraad (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0808.* 12 p. 5 refs.

Conventional ships encounter at high speeds a wave-making drag phenomenon which increases roughly as the cube of the velocity. The Surface Effect Ship (SES) concept alleviates this deficiency by permitting the ship to ride on a cushion of air. This cushion is created by large vertical-axis fans, which are contained between twin catamaran hulls and pliant seals fore and aft. These seals are essentially transparent to wave passage. Speeds on the order of 100 knots can thus be realized. A summary is provided of developments related to two aircraft carrier SES design contracts. Attention is given to basic SES design criteria, the definition and feasibility study of a minimum size SES aircraft carrier (SES-CV), aspects of SES-CV conceptual design, and CTOL aircraft carrier options. G.R.

A82-31982 # **Considerations for international joint venture development of very large aircraft.** W. A. Garrett (Lockheed-Georgia Co., Marietta, GA) and H. Liese (Dornier GmbH, Friedrichshafen, West Germany). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0809.* 10 p. 5 refs.

Attention is given to a joint international civilian-military venture for the development of a common aircraft that will satisfy the growing mutual defense objectives and commercial interests of both the U.S. and the respective European NATO countries. The high costs involved in the development and manufacture of an advanced-technology, fuel efficient, transport aircraft for the considered applications make it imperative to find an approach in which these costs are distributed among a number of partners. A description is presented of an investigation conducted by an American and a European aerospace company, relative to the prospects for a joint U.S./European NATO cooperative aircraft venture. The decision of the two companies to conduct this investigation is based on a long-standing interest in Very Large Aircraft concepts. G.R.

A82-31983 * # **Multibody transport concept.** J. W. Moore (Lockheed-Georgia Co., Marietta, GA) and D. V. Maddalon (NASA, Langley Research Center, Laminar Flow Control Projects Office, Hampton, VA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0810.* 13 p. 8 refs.

Two baseline aircraft are configured in this study. The multibody aircraft has two fuselage bodies located at approximately 28% wing semispan. The single-body aircraft is configured in such a way as to provide a reference base with which the multibody aircraft can be compared. The aircraft are sized to provide the lowest direct operating cost configuration when transporting 771,620 lbs. over a distance of 3,500 nautical miles at a cruise speed of Mach 0.80. The aircraft are assumed to operate in the years 1990-1995, thus allowing for the incorporation of those technologies expected to be mature and available for production usage in 1985. In comparison with the single-body aircraft, the two-body aircraft shows reductions of 8.9% in wing weight, 7.7% in structural weight, 13.5% in block fuel weight, and 11.3% in direct operating cost. C.R.

A82-31984 * # **Solar-powered airplane design for long-endurance, high-altitude flight.** J. W. Youngblood and T. A. Talay (NASA, Langley Research Center, Space Systems Div., Hampton, VA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0811.* 10 p. 24 refs.

This paper describes the performance analysis and design of a solar-powered airplane for long-endurance, unmanned, high-altitude cruise flight utilizing electric propulsion and solar energy collection/storage devices. For a fixed calendar date and geocentric latitude, the daily energy balance, airplane sizing, and airplane aerodynamics relations combine to determine airplane size and geometry to meet mission requirements. Vehicle component weight loadings, aerodynamic parameters, and current and projected values of power train component characteristics form the basis of the solution. For a specified mission, a candidate airplane design is presented to demonstrate the feasibility of solar-powered long endurance flight. Parametric data are presented to illustrate the airplane's mission flexibility. (Author)

A82-31985 # **System study of application of composite materials for future transport aircraft.** R. H. Lange and J. W. Moore (Lockheed-Georgia Co., Marietta, GA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0812.* 7 p. 13 refs.

The application of advanced technologies shows the potential for significant improvement in the fuel efficiency of future transport aircraft envisioned for operations in the mid to late 1990s. This paper reviews recent preliminary design system studies of advanced civil/military transport aircraft featuring cost/benefit analysis of advanced technology. Emphasis is directed toward the use of graphite/epoxy composite materials in the primary and secondary structures of transport aircraft. The aircraft design parameters include cruise Mach number of 0.80, design payload of 330,000 pounds, and 3,500 nautical miles range. (Author)

A82-31986 # **Very large aircraft with alternate fuels - LH2 most promising.** J. C. Muehlbauer (Lockheed-Georgia Co., Marietta, GA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0813.* 10 p. 7 refs.

Optimum designs of cargo aircraft using alternate fuels and carrying large payloads roundtrip over transoceanic distances without refueling are developed and compared. Synthetic jet propulsion (JP) fuel, liquid hydrogen (LH2) fuel, and nuclear power are considered. In relation to the JP aircraft, the LH2 aircraft is found to have lower ramp weights (by 25%) and lower trip costs (15%). The ramp weights and trip costs of the nuclear aircraft are, respectively, approximately 5 and 20% higher than those for the JP aircraft. With JP aircraft trip costs the most sensitive to fuel price, it is believed that rising prices in the future will make LH2 and nuclear power increasingly attractive. C.R.

A82-31987 # **The potential for long-range high-payload aircraft with alternate fuels.** W. M. Hawkins (Lockheed Corp., Burbank, CA). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0814.* 7 p. 5 refs.

It is assumed that these aircraft will not be produced until the year 2005 and that they will use liquid hydrogen, which can be produced using coal, natural gas, or any other source of energy and water. With regard to propulsion, the present size of modern high-by-pass engines will be employed; between 6 and 12 such units will be used on each aircraft. Control systems in use today to relieve structural loads will figure in the design, as will controls to avoid flutter, which at present are under development. Also considered possible is the use of precision rendezvous. It is pointed out that the cooling capacity of the liquid hydrogen fuel may be able to maintain laminar flow over a substantial portion of the aircraft by surface cooling. C.R.

A82-31988 # **Beyond 2000 - The airlift challenge ahead.** W. T. Stallings (USAF, Military Airlift Command, Scott AFB, IL). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0815.* 6 p. 16 refs.

This paper discusses the present course and current concerns of the U.S. aviation industry. The paper suggests that the future strength of the industry could be enhanced through civil-military commonality and international cooperative agreements. A strong national air transportation policy is also advocated as a means to revitalize the industry. (Author)

A82-31991 **A system design for a multispectral sensor using two-dimensional solid-state imaging arrays.** R. M. Hodgson (Canterbury, University, Christchurch, New Zealand), F. M. Cady (Montana State University, Bozeman, MT), and D. Pairman (Department of Scientific and Industrial Research, Physics and Engineering Laboratories, Lower Hutt, New Zealand). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Apr. 1982, p. 177-179. 7 refs. Research supported by the University of Canterbury and University Grants Committee.

A system developed for remote sensing from light aircraft in the 400-1100 nm wavelength range possesses an architecture which permits the simultaneous capture of up to four images from solid-state, two-dimensional image sensors. In operation, the array sensor captures a series of relatively rapid, approximately 10 msec exposures at intervals as long as 10 sec. This mode of operation has the advantage of nearly the same degree of distortion due to aircraft roll in all image elements. The software generation of sensor drive signals is incorporated in the system. O.C.

A82-31999 **Army's 1st IPI program begun - Blisk impeller followup.** A. E. Goldberger (McDonnell-Douglas Corp., St. Louis, MO). *ManTech Journal,* vol. 6, no. 4, 1981, p. 6-14. Army-supported research.

A description is given of the performance-enhancement and manufacturing cost-reduction advantages of the blisk, or integral blade-disk, method of axial and centrifugal compressor rotor construction exemplified by the T700 helicopter engine. The five axial stages and single centrifugal stage of the T700 compressor rotor achieves a 15:1 compression ratio, by comparison to the 8:1 ratio of the T58 engine compressor. The blisk manufacturing approach is embodied in a single, integrated manufacturing center which employs numerical control equipment for all fabrication steps. These steps include the machining of forgings to within 0.125 in of their rectilinear configuration, ultrasonic and magnaflux inspection, and finish turning on a numerically-controlled slant bed turret lathe. Attention is given the novel technique of abrasive flow machining for final airfoil finishing. O.C.

A82-32055 **Recent developments in aviation cases.** D. L. Campbell and D. K. Cherry. *Journal of Air Law and Commerce,* vol. 47, Fall 1981, p. 1-52. 342 refs.

Aviation court case decisions in 1980 are reviewed. The trend was strongly in favor of defendants, especially manufacturers and component manufacturers, with several successful motions for summary judgment. Defendants were also very often successful in enforcing contractural waivers between parties of relatively equal status. Numerous cases involved implied causes of action arising out of aviation statutes, and the trend toward enforcement of the Warsaw Convention's technical requirements continued. There were further cases alleging U.S. negligence in the publication of aeronautical charts. The courts continued to enforce coverage limitations and exclusions in aviation insurance policies. Numerous interesting decisions in the area of conflict of laws were handed down, most of them dealing with areas of great activity such as the offshore North Sea exploration and drilling operations. C.D.

A82-32056 **Predicting the application of vicarious liability to fixed base operators - Still guesswork after all these years.** L. S. Kaplan. *Journal of Air Law and Commerce,* vol. 47, Fall 1981, p. 53-89. 168 refs.

A82-32059 **Aviation accident investigation - Functional and legal perspectives.** C. O. Miller (System Safety, Inc., McLean, VA). *Journal of Air Law and Commerce,* vol. 46, Winter 1981, p. 237-293. 187 refs.

The legislative history of aviation accident investigation, current rules and procedures in investigation, probable cause in investigation and the law, and problems in investigation in relation to law and society are discussed. The Federal Aviation Act of 1958, Department of Transportation Act of 1966, Independent Safety Board Act of 1974, Federal Tort Claims Act, Freedom of Information Act, Federal Advisory Committee Act, Privacy Act, Government in the Sunshine Act, and Airline Deregulation Act are discussed in terms of their effect on accident investigation. The various rules promulgated in the area are detailed. The distinction between factual and legal cause is discussed in terms of its influence on accident investigation, particularly the problem of multiple causation. Finally, problems of openness of investigation are assessed. C.D.

A82-32062 **Factors influencing settlement of personal injury and death claims in aircraft accident litigation.** R. R. Craft, Jr. (Haight, Gardner, Poor and Havens, New York, NY). *Journal of Air Law and Commerce,* vol. 46, Summer 1981, p. 895-940. 84 refs.

The Tenerife accident (March 1977) is used as a reference point in a discussion of settlement of aircraft accident litigation. The topics discussed include gathering information and contacting clients; initial role of plaintiffs' attorneys; setting up funds and making offers; multidistrict litigation and narrowing of issues; forum non conveniens; punitive damages; prejudgement interest; the roles of the judge and the attorneys for both sides; settlement negotiations; and attorneys' fees. C.D.

A82-32063 **Aviation negotiations and the U.S. model agreement.** R. W. Bogosian (U.S. Department of State, Office of Aviation, Washington, DC). *Journal of Air Law and Commerce,* Summer 1981, p. 1007-1037. 52 refs.

As historical background, the development from the liberal post-World War II Bermuda I bilateral aviation agreement to the restrictive Bermuda II agreement of 1977 is traced. The U.S. model agreement (the text of which is included) is then discussed. The 'doing business' provisions provide both parties with fair and equal opportunity to compete, and require that unfair competitive practices and discriminations be removed. One article requires complete operational freedom, subject to customs or other technical constraints. The pricing article calls for mutual disapproval pricing based upon market considerations and limits intervention to prevention of predatory or discriminatory pricing, protection of consumers from excessively high prices and of airlines from excessively low ones. The opposition of foreign aviation leaders is discussed and present achievements and future prospects are assessed. C.D.

A82-32135 **A unified and generalized definition of static longitudinal stability in aircraft (Zur Vereinheitlichung und Verallgemeinerung des Begriffs der statischen Stabilität von Fluggeräten).** R. Staufenbiel (Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung,* vol. 6, Mar.-Apr. 1982, p. 74-80. 10 refs. In German.

The static stability of vibrational modes is mathematically analyzed. Equations are derived for static stability conditions that ignore Mach number and altitude, and then equations that include them are derived. A general procedure for obtaining the conditions necessary for longitudinal stability is demonstrated. C.D.

A82-32136 **Parameter identification for structures with neighboring natural frequencies especially for the case of flight resonance tests (Parameteridentifikation bei Strukturen mit benachbarten Eigenfrequenzen, speziell bei Flugschwingungsversuchen).** H. Wittmeyer. *Zeitschrift für Flugwissenschaften und Weltraumforschung,* vol. 6, Mar.-Apr. 1982, p. 80-90. 8 refs. In German.

A procedure to be used for linear vibrating systems that are viscously or structurally damped, especially where the eigenfrequencies are neighbors, is developed. The procedure is applied to a sample vibrational system with viscous damping whose symmetries have no unusual characteristics, such as a vibration test in a wind tunnel. Structural amplitudes are evaluated at several points and for several exciting frequencies. These amplitudes are the structural solutions for harmonic excitation by a set of forces whose amplitude general weakness in the forward swept configurations was found compared to aft swept ones. D.L.G.

A82-34498 # Automatic checking of measuring units in the Modane wind tunnels. X. Bouis, G. Gavet, and R. Combaz (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Supersonic Tunnel Association, Meeting, Seattle, WA, Mar. 29, 30, 1982.) ONERA, TP* no. 1982-10, 1982. 10 p.

Hardware and software means are implemented to improve measurement accuracy, to accelerate test runs and to detect errors or failures in measuring units in Modane wind tunnels. These improvements allow the correct settings of the gains and cut-off frequencies of amplifiers and filters to be checked at regular intervals, in addition to the calibration of analog-to-digital converters. Signals are applied to the measuring unit, which, after amplification, should give voltages of -9, -6, -3, 0, 3, 6, 9, and 0 V to the converter terminals. The result is correct if the deviation does not exceed plus or minus 2 mV, except around zero, where it is required to respect the limits of plus or minus 1 mV. The overall precision of the measuring unit exceeds the range of plus or minus 0.00021. D.L.G.

A82-34499 # Aircraft potential variations in flight. J. L. Boulay and P. Laroche (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(International Aerospace Conference on Lightning and Static Electricity, Oxford University, Oxford, England, Mar. 23-25, 1982.) ONERA, TP* no. 1982-11, 1982. 20 p. 21 refs. Research supported by the Direction des Recherches, Etudes et Techniques.

Some airborne experiments have been achieved in order to study the electrostatic behavior of an aircraft in flight. Variations of triboelectric current and potential of the aircraft were recorded in different atmospheric configurations. Some passive dischargers arrangements on the aircraft structure have been also characterized. (Author)

A82-34536 The initial lift and drag of an impulsively started airfoil of finite thickness. C.-Y. Chow and M.-K. Huang (Colorado, University, Boulder, CO). *Journal of Fluid Mechanics*, vol. 118, May 1982, p. 393-409. 10 refs. Grant No. AF-AFOSR-81-0037.

An apparent masses formulation for an airfoil-shed vortex sheet combination is employed to model the initial lift and drag of an airfoil started impulsively from rest. The method is first applied to a flat plate to prove the accuracy and then extended to airfoils of finite thickness. Specific attention is given to the Joukowski airfoil, for which the flat plate is shown to be a special case. Further analysis is presented for a Karman-Trefftz airfoil. In the case of the Joukowski airfoil, increasing camber or angle-of-attack was demonstrated to increase the initial lift and drag, while increasing thickness caused a decrease. For the Karman-Trefftz airfoil, any finite trailinq-edge angle was found to decrease both lift and drag to zero at the starting instant. It is concluded that thicker airfoils or airfoils with large trailing edge angles tend to resist increases in lift. M.S.K.

A82-34607 * Outline of a multiple-access communication network based on adaptive arrays. S. Zohar (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *IEEE Transactions on Communications*, vol. COM-30, May 1982, pt. 2, p. 1242-1248. 7 refs. Contract No. NAS7-100.

Attention is given to a narrow-band communication system consisting of a central station trying to receive signals simultaneously from K spatially distinct mobile users sharing the same frequencies. One example of such a system is a group of aircraft and ships transmitting messages to a communication satellite. A reasonable approach to such a multiple access system may be based on equipping the central station with an n-element antenna array where n is equal to or greater than K. The array employs K sets of n weights to segregate the signals received from the K users. The weights are determined by direct computation based on position information transmitted by the users. A description is presented of an improved technique which makes it possible to reduce significantly the number of required computer operations in comparison to currently known techniques. G.R.

A82-34639 # Calculation of the lift distribution and aerodynamic derivatives of quasi-static elastic aircraft. Q. Liu, C. Wu, and Z. Jian (Northwestern Polytechnical University, Xi'an, People's Republic of China). *Acta Aeronautica et Astronautica Sinica*, vol. 3, Mar. 1981, p. 1-11. 10 refs. In Chinese, with abstract in English.

Quasi-static approximations of the aerodynamic characteristics of an elastic aircraft are undertaken by means of a numerical method, which may be used to evaluate the lift distribution and 11 main longitudinal aerodynamic derivatives of the elastic aircraft at subsonic speeds. Green's function methods are used for the aerodynamic calculations, and structural deformation is evaluated by the free structure influence coefficient method. Numerical examples are given, and dynamical problems of elastic aircraft are discussed. It is established that the derivatives employed may be directly adopted for elastic aircraft stability and control analyses. O.C.

A82-34644 # Experimental study on discharge and loss coefficients of combustor swirlers. C. Zhang (Wuxi Aircraft Engine Research Institute, Wuxi, People's Republic of China) and Y. Wang (Shenyang Liming Machinery Co., Shenyang, People's Republic of China). *Acta Aeronautica et Astronautica Sinica*, vol. 3, Mar. 1981, p. 50-57. In Chinese, with abstract in English.

Blade-type swirlers used to control primary flametube airflow in aircraft engine combustors incur losses which depend on blade stagger angle, pitch/chord ratio and blade passage area. A set of discharge characteristics and relations between loss coefficients and the parameters mentioned are given, along with the correlation of loss to discharge coefficients. It is found that the discharge coefficient varies from 0.6 to 0.9 for swirlers with different stagger angles. It is found that blade loss is smaller than secondary expansion loss for a given combustor swirler, and that the twisted blade swirler design is superior to the straight-bladed one from an aerodynamic viewpoint, offsetting its higher production costs. O.C.

A82-34645 # Aerodynamic coefficient identification of time-varying aircraft system and its application. T. Wang (China Precision Machinery Corp., Beijing Research Institute, Beijing, People's Republic of China). *Acta Aeronautica et Astronautica Sinica*, vol. 3, Mar. 1981, p. 67-76. In Chinese, with abstract in English.

It is shown, on the basis of flight test measurements and analyses of trends in the coefficients of aircraft time-varying differential equations, that it is possible to transform the individual time-varying coefficient into a known function multiplied by an unknown constant. By extending the Newton-Raphson method to the time-varying coefficient differential equations, such undefined coefficients may be evaluated through iteration calculation. This scheme is evaluated in light of data taken during unsteady flight, and the reliability of aerodynamic coefficients obtained through this identification method is discussed. Good agreement is found between calculations and test data. O.C.

A82-34671 Doppler processing, waveform design and performance measures for some pulsed Doppler and MTD-radars. II. A. Ludloff, N. Füchter, F. Hagedorn, M. Minker, and H. Rohling (Telefunken AG, Ulm, West Germany). *Ortung und Navigation*, no. 1, 1982, p. 5-54. 21 refs. Research supported by the Bundesministerium für Verkehr.

Subclutter visibility (SCV), design principles, calculation of filter transfer function, and SNR and signal-to-interference ratio (SIR) improvements are discussed. The definition of SCV, the mean detection probability as a function of SCV, SCV as a function of an average SIR improvement, approximate calculation of SCV, and processor SNR loss budget are analyzed. The design principles discussed include dynamic range versus equipment noise, pulsed oscillator versus power amplifier, transversal filter bank versus MTI-FFT processing, advantages obtained by using frequency diversity, necessity of circular polarization, and radar site selection. Filter bank with MTI and DFT, filter weights derived from a modified MLR test, weighting sequences for windows, and calculation of SNR and SIR improvements are analyzed. A practical example is given. C.D.

A82-34672 Short-term behavior of a Doppler navigation system and comparison with position indication by means of scanning radar (Kurzzeitverhalten eines Doppler-Navigationssystems und Vergleich mit Positionsbestimmungen durch ein Vermessungsradar). K. Ramsayer and G. Klaedtke (Stuttgart, Universität, Stuttgart, West Germany). *Ortung und Navigation*, no. 1, 1982, p. 125-138. In German.

A concept of integrated navigation via adjustment by the method of least squares was tested in a military aircraft. The navigation equipment of the aircraft included the Bendix DRA-12B double radar and the Sperry gyroscopic platform SYP 820 furnished with a computer integrated with TACAN and DME. The flight test results are reported. In order to test various off-line evaluation methods in addition to on-line evaluation during flight, the Doppler pulses, drift, heading, and other interesting parameters were registered. The results showed that the Doppler navigation system measurements were very 'noisy'. To determine the short-term behavior of the system, recordings were investigated for an approximately rectilinear flight of 300 seconds length. The aircraft distance, azimuth, and angle of elevation were continuously recorded by scanning radar, enabling a comparison to be made with the Doppler system. C.D.

A82-34700 Air cooling of gas turbine blades. O. N. Favorskii and S. Z. Kopelev. *(Teploenergetika, vol. 28, Aug. 1981, p. 7-11.) Thermal Engineering*, vol. 28, Aug. 1981, p. 435-438. 13 refs. Translation.

During the last 20 years, the gas temperature at the inlet of aircraft gas turbines has been raised by 450 K to a temperature of 1650 K. The achievement of the current high operational temperatures, which have led to a considerable enhancement in engine efficiency, has been largely made possible by the development of suitable approaches for cooling the gas turbine blades. The various factors involved in designing an effective cooling procedure are considered, taking into account the necessity that the involved flow processes must not result in a lowering of engine efficiency, and, in connection with large temperature gradients or the introduction of stress-raising design features, must not unduly reduce the operational life of the engine. Attention is given to the internal convective and the convection-film air cooling of blades, the promotion of flow turbulence by means of internal baffles, the hydraulic resistance of internal cooling channels, and merits and drawbacks of perforations. G.R.

A82-34737 **An optical data link for airborne scanning system.** M. J. Green (Wisconsin, University, Madison, WI). In: American Society of Photogrammetry, Annual Meeting, 47th, Washington, DC, February 22-27, 1981, ASP Technical Papers. (A82-34701 16-43) Falls Church, VA, American Society of Photogrammetry, 1981, p. 476-482.

In connection with a study of oceanic thermal fronts, the Navy is interested in a thermal scanning system which could be used with their P-3 patrol aircraft. A suitable scanning system would be the RS-18A scanning thermal IR radiometer. However, an obstacle regarding the envisaged use of the instrument is related to the necessity to employ the aircraft without an introduction of any modifications. The obstacle has been overcome by making use of an optical data link which replaces the hardwire connections between the scanner and the power supply. The optical link is housed in a ten inch diameter tube which is clamped in position directly behind the scanner head. G.R.

A82-34748 # **Mach reflection of a shock wave from an inclined wall.** T. Ikui, K. Matsuo, N. Kondoh (Kyushu University, Fukuoka, Japan), and T. Aoki. *Kyushu University, Faculty of Engineering, Memoirs,* vol. 41, Dec. 1981, p. 361-380. 24 refs.

The Mach reflection phenomena of shock waves that encounter a wall inclined to the shock are investigated over a wide range of incident Mach number and wedge angle using air, carbon-dioxide and chlorofluoro-carbon (Freon-12) as a working gas. A new type of reflection which cannot be classified as regular reflection, single-Mach, complex-Mach or double-Mach reflections is observed in Freon-12 and is called pseudo-regular reflection. An equation expressing the distance between a slip stream and a Mach shock wave along the wedge surface is proposed, and the phenomenon of the rolling-up of the slip stream is explained. An equation predicting the location of the kink point in the case of double-Mach reflection is presented, which agrees with experimental evidence better then Law's (1970) method. Transitions from single-Mach to complex-Mach reflections and complex-Mach to double-Mach reflections are explained, and a criterion of the rolling-up of the slip stream is presented. D.L.G.

A82-34772 **Measuring LF and MF antenna radiation patterns by means of a helicopter.** D. J. Bem (Wroclaw, Politechnika, Wroclaw, Poland) and E. Zemicki (Institute of Telecommunications, Wroclaw, Poland). In: Electromagnetic compatibility 1980; Proceedings of the Fifth International Wroclaw Symposium and Exhibition, Wroclaw, Poland, September 17-19, 1980. Part 2. Wroclaw, Wydawnictwo Politechniki Wroclawskiej, 1980, p. 761-739.

The paper deals with a method of measuring power gain and radiation pattern of LF and MF antennae, applying the standard field produced by a loop antenna installed on a helicopter. A method of radionavigation necessary for this purpose has been presented. Results of measurements of several antennae have also been given. (Author)

A82-34814 † **A study of the vibration loading of the turbine blades of an aircraft gas-turbine engine with dry-friction dampers (Issledovanie vibratsionnoi nagruzhennosti rabochikh lopatok turbiny aviatsionnogo GTD s dempferami sukhogo treniia).** V. M. Kapralov and R. V. Skvortsov. *Problemy Prochnosti,* May 1982, p. 83-85. In Russian.

The use of box-type dry-friction dampers in aircraft gas-turbine engines is discussed, and a method is proposed for the determination of the required damper mass. In accordance with the proposed method, the damper mass is first determined by using an approximate formula. Further studies involving amplitude and spectral analysis make it possible to evaluate the damper efficiency and finally select the damper mass. V.L.

A82-34851 # **Contact problems involving the flow past an inflated aerofoil.** J.-M. Vanden-Broeck (Stanford University, Stanford, CA). *ASME, Transactions, Journal of Applied Mechanics,* vol. 49, June 1982, p. 263-265. 10 refs. USAF-Navy-Army-NSF-supported research.

Steady potential flow around a two-dimensional inflated airfoil is considered. The aerofoil consists of a flexible and inextensible membrane which is anchored at both leading and trailing edges. The flow and the aerofoil shape are determined as functions of the angle of attack, the cavitation number, and the Weber number. When the cavitation number decreases to a critical value, opposite sides of the membrane become tangent to each other at the trailing edge. For values less than critical, the aerofoil is partially collapsed near the trailing edge. The length of the region of collapse increases as the cavitation number decreases and for a cavitation number equal to minus infinity, the aerofoil is completely collapsed. The shape of the aerofoil and the value of the critical cavitation number are determined analytically by a perturbation solution for small Weber numbers. Graphs of the results are presented. (Author)

A82-34861 # **Unconventional internal cracks. II - Method of generating simple cracks.** C. H. Wu (Illinois, University, Chicago, IL). *ASME, Transactions, Journal of Applied Mechanics,* vol. 49, June 1982, p. 383-388. 10 refs.

The meaning of the word crack is extended to include holes with cusps of vanishing cusp angle. A crack is said to be simple if the associated elasticity problem has a closed-form solution. Many classes of simple cracks are constructed and solved in this two-part paper. In particular, a method of constructing very sharp cusps is described. These cusps possess not only a zero slope (zero cusp angle) but a vanishing curvature as well. In fact, a crack may be constructed in such a way that the first N derivatives are all zero. (Author)

A82-34879 **A review and assessment of fatigue crack growth rate relationships for metallic airframe materials.** J. B. Chang, M. Szamossi, and E. Klein (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA). In: Fracture and failure: Analyses, mechanisms and applications; Proceedings of the Symposium, Los Angeles, CA, March 17-20, 1980. Metals Park, OH, American Society for Metals, 1981, p. 35-54. 13 refs. Contract No. F33615-77-C-3121.

An R&D program recently undertaken by Rockwell for the U.S. Air Force is aimed at upgrading the fatigue crack growth prediction technology required for implementation of the damage tolerance control procedures throughout the life cycle of any weapon system. To accomplish this objective, it was considered necessary to review and evaluate the state-of-the-art fatigue crack growth rate equations commonly used for performing damage-tolerance analysis on airframe structures. Three such rate equations (the Boeing, Grumman, and Rockwell equations) were assessed using baseline crack growth test data. It is shown that, by properly choosing the rate constants, all three equations can be used to characterize the fatigue crack growth rate relationships for airframe materials. B.J.

A82-34882 **Failure analysis of silica phenolic nozzle liners.** M. Katcher (Marquardt Co., Van Nuys, CA). In: Fracture and failure: Analyses, mechanisms and applications; Proceedings of the Symposium, Los Angeles, CA, March 17-20, 1980. Metals Park, OH, American Society for Metals, 1981, p. 165-183.

The Marquardt Company's failure investigation of cracking in two silica phenolic nozzle liners during proof testing is described. The proof testing consisted of pressuring the nozzles to 14.1 MPa for 5 to 20 sec. It is found that the longitudinal cracking of the convergent exhaust nozzle insulators was due to the use of bad fiber/fabric material by a supplier. This material was used in the manufacture of silica phonolic tape that was later used by Marquardt's exhaust nozzle liner supplier. The bad fiber/fabric could not be distinguished by then current quality control procedures which assessed tape strength properties in the warp as opposed to the bias direction. It was also found that the introduction of the bad fiber/fabric material was the only distinctive difference between the nozzle insulators that failed and other nozzles that had successfully passed. B.J.

A82-34883 # **Large scale aeroengine compressor test facility.** *Ishikawajima-Harima Engineering Review,* vol. 22, Mar. 1982, p. 133-136. In Japanese, with abstract in English.

Installation of a test facility for large compressors has recently been completed at IHI Mizuho Plant to serve in the development of aircraft engine components. The facility comprises a driving unit (IHI-developed IM 2000 gas turbine), intake and exhaust systems for the test compressor, and a data acquisition system. It is capable of testing compressors up to 18,000 SPS (13.2 MW) with maximum speed of 13,000 rpm. The whole system has been compactly designed to be installed in a small space as compared with similar facilities constructed in the past. The data acquisition system makes full use of the latest developments in minicomputers and pressure/temperature measuring devices to provide on-line computing of the measured data for instant display of the compressor overall performance as well as detailed aerodynamic properties of the internal flow field. The system has already been utilized for the front fan model testing of the RJ 500 engine which is an Anglo-Japanese collaborative engine for the next generation civil transport and proven to be a very effective tool for the achievement of high level performance requirements. TUNNEL-TO-TUNNEL CORRELATION

Frank W. Steinle, Jr. *In* NASA. Langley Research Center Wind-Tunnel/Flight Correlation, 1981 Jun. 1982 p 47-63 refs

Avail: NTIS HC A10/MF A01 CSCL 01A

Flow quality is discussed. Incremental comparisons of: (1) the angle of attack, (2) the axial force coefficient, and (3) the base cavity axial force coefficient against the normal force coefficient are presented. Relative blockage determination, relative buoyancy corrections, and boundary layer transition length are discussed. Blockage buoyancy caused by tunnel model wall dynamic interaction is discussed in terms of adaptive walls. The effect of 'transonic turbulence factor' is considered. N.W.

OPPORTUNITIES FOR WIND-TUNNEL/FLIGHT CORRELATION WITH NEW BOEING AIRPLANES

Adelbert L. Nagel *In* NASA. Langley Research Center Wind-Tunnel-Flight Correlation, 1981 Jun. 1982 p 141-157

Avail: NTIS HC A10/MF A01 CSCL 01A

The use of correlated data in airplane development is discussed. Areas of interest include initial airworthiness of an aircraft, low-speed configuration optimization, and high-speed configuration optimization. Data from wind tunnel tests are shown to be significant when applied to guarantee compliance, which includes fuel consumption, airspeeds, and takeoff and landing performance. The use of correlation in achieving FAA certification is also discussed. T.M.

N82-25207*# General Dynamics/Fort Worth, Tex.

F-16E PROGRAM OVERVIEW AND WIND TUNNEL/FLIGHT CORRELATION

A. P. Madsen *In* NASA. Langley Research Center Wind-Tunnel/Flight Correlation, 1981 Jun. 1982 p 159-172 ref

Avail: NTIS HC A10/MF A01 CSCL 01A

Correlation is defined in three different ways: comparisons of wind tunnel and/or theory with flight results; detailed studies of total vehicle drag from wind tunnel and flight tests; and attempts to understand the fundamental mechanisms of fluid flows associated with aircraft components in specific areas of the flight environment. The F-16E configuration is an outgrowth of studies conducted to produce a refined fighter wing design. Several iterations required to arrive at the combination of wing planform, camber, and twist which gives near optimum lift, drag, and high-angle-of-attack stability. Theoretical analyses were backed up by extensive experimental data to validate the design and are presented. T.M.

X-29A FORWARD-SWEPT-WING DEMONSTRATOR AIRPLANE

Douglas R. Frei *In* NASA. Langley Research Center Wind-Tunnel/Flight Correlation, 1981 Jun. 1982 p 177-189

Avail: NTIS HC A10/MF A01 CSCL 01A

The X-29A is a technology demonstrator. The FSW is just one of the technologies. Others include the following: discrete variable camber, relaxed static stability, triplex digital fly-by-wire (FBW) control system, variable-incidence/close-coupled canard, aeroelastically tailored composite wing, and thin supercritical airfoil. The growth potential for additional technologies is shown. T.M.

APPLICATION OF COMPUTATIONAL FLUID DYNAMICS (CFD) IN TRANSONIC WIND-TUNNEL/FLIGHT-TEST CORRELATION

Earl M. Murman *In* NASA. Langley Research Center Wind-Tunnel/Flight Correlation, 1981 Jun. 1982 p 199-215 refs

Avail: NTIS HC A10/MF A01 CSCL 01A

The capability for calculating transonic flows for realistic configurations and conditions is discussed. Various phenomena which were modeled are shown to have the same order of magnitude on the influence of predicted results. It is concluded that CFD can make the following contributions to the task of correlating wind tunnel and flight test data: some effects of geometry differences and aeroelastic distortion can be predicted; tunnel wall effects can be assessed and corrected for; and the effects of model support systems and free stream nonuniformities can be modeled. T.M.

ELASTIC DEFORMATION EFFECTS ON AERODYNAMIC CHARACTERISTICS FOR A HIGH-ASPECT-RATIO SUPERCRITICAL-WING MODEL

Judith J. Watson May 1982 26 p refs

(NASA-TM-83286; L-15098; NAS 1.15:83286) Avail: NTIS HC A03/MF A01 CSCL 01A

The results of an investigation of the deformations of a high-aspect-ratio, force/pressure, supercritical-wing model during wind tunnel tests and the effects these deformations have on the wing aerodynamics are presented. A finite element model of the wing was developed, and then, for conditions corresponding to wind tunnel test points, experimental aerodynamic loads and theoretical aerodynamic loads were applied to the finite element model. Comparisons were made between the results of these load conditions for changes in structural deflections and for changes in aerodynamic characteristics. The results show that the deformations are quite small and that the pressure data are not significantly affected by model deformation. B.W.

WATER TUNNEL FLOW VISUALIZATION AND WIND TUNNEL DATA ANALYSIS OF THE F/A-18

Gary E. Erickson May 1982 268 p refs Original contains color illustrations 2 Vol.

(Contract NAS1-16617)

(NASA-CR-165859; NAS 1.26:165859) Avail: NTIS HC A12/MF A01 CSCL 01A

Six degree of freedom studies were utilized to extract a band of yawing and rolling moment coefficients from the F/A-18 aircraft flight records. These were compared with 0.06 scale model data obtained in a 16T wind tunnel facility. The results, indicate the flight test yawing moment data exhibit an improvement over the wind tunnel data to near neutral stability and a significant reduction in lateral stability (again to anear neutral level). These data are consistent with the flight test results since the motion was characterized by a relatively slo departure. Flight tests repeated the slow yaw departure at M 0.3. Only 0.16 scale model wind tunnel data showed levels of lateral stability similar to the flight test results. Accordingly, geometric modifications were investigated on the 0.16 scale model in the 30x60 foot wind tunnel to improve high angle of attack lateral stability. S.L.

SUBSONIC AERODYNAMIC AND FLUTTER CHARACTERISTICS OF SEVERAL WINGS CALCULATED BY THE SOUSSA P1.1 PANEL METHOD

E. Carson Yates, Jr., Herbert J. Cunningham, Robert N. Desmarais, Walter A. Silva, and Bohdan Drobenko May 1982 21 p refs Presented at the AIAA/ASME/ASCE/AHS 23rd Structures, Structural Dynamics and Materials Conf., New Orleans, 10-12 May 1982
(NASA-TM-84485; NAS 1.15:84485) Avail: NTIS HC A02/MF A01 CSCL 01A

The SOUSSA (steady, oscillatory, and unsteady subsonic and supersonic aerodynamics) program is the computational implementation of a general potential flow analysis (by the Green's function method) that can generate pressure distributions on complete aircraft having arbitrary shapes, motions and deformations. Some applications of the initial release version of this program to several wings in steady and oscillatory motion, including flutter are presented. The results are validated by comparisons with other calculations and experiments. Experiences in using the program as well as some recent improvements are described. S.L.

EXPERIMENTAL DETERMINATION OF FLOW-INTERFERENCE EFFECTS OF WING-MOUNTED, TWO-DIMENSIONAL, FULL-CAPTURE PROPULSION NACELLES IN CLOSE PROXIMITY TO A VEHICLE BODY AT A MACH NUMBER OF 6

Walter A. Vahl May 1982 36 p refs
(NASA-TM-83287; L-15209; NAS 1.15:83287) Avail: NTIS HC A03/MF A01 CSCL 01A

Experimental tests have been conducted to determine possible aerodynamic interference effects due to the lateral positioning of two dimensional propulsion nacelles mounted on a wing surface in close proximity to a vehicle body. The tests were conducted at a Mach number of 6 and a Reynolds number 7 million per foot. The angle of attack range for force tests was -9 deg to 9 deg. The model configurations consisted of combinations of rectangular and trapezoidal cross section bodies with a wing swept 65 and a rectangular planform wing. A pair of two dimensional, flow through propulsion nacelles simulated full capture inlet operation. S.L.

THRUST-INDUCED EFFECTS ON LOW-SPEED AERODYNAMICS OF FIGHTER AIRCRAFT

Daniel W. Banks, P. Frank Quinto, and John W. Paulson, Jr. May 1982 25 p refs
(NASA-TM-83277; NAS 1.15:83277) Avail: NTIS HC A02/MF A01 CSCL 01A

Results of NASA Langley has conducted wind-tunnel investigations of several fighter configurations conducted to determine the effects of both thrust vectoring and spanwise blowing are reviewed. A recent joint NASA/Grumman Aerospace Corporation/U.S. Air Force Wright Aeronautical Laboratory wind-tunnel investigation was conducted to examine the effects of spanwise blowing on the trailing-edge flap system. This application contrasts with the more familiar method of spanwise blowing near the wing leading edge. Another joint program among NASA/McDonnell Aircraft Company/U.S. Air Force Wright Aeronautical Laboratory investigated the effects of reverse thrust on the low-speed aerodynamics of an F-15 configuration. The F-15 model was fitted with a rotating van thrust reverser concept which could simulate both in-flight reversing for approach and landing or full reversing for ground roll reduction. The significant results of these two joint programs are reported. A.R.H.

PRODUCTION VERSION OF THE EXTENDED NASA-LANGLEY VORTEX LATTICE FORTRAN COMPUTER PROGRAM. VOLUME 1: USER'S GUIDE

John E. Lamar and Harry E. Herbert Apr. 1982 178 p refs
(NASA-TM-83303; NAS 1.15:83303) Avail: NTIS HC A08/MF A01 CSCL 01A

The latest production version, MARK IV, of the NASA-Langley vortex lattice computer program is summarized. All viable subcritical aerodynamic features of previous versions were retained. This version extends the previously documented program capabilities to four planforms, 400 panels, and enables the user to obtain vortex-flow aerodynamics on cambered planforms, flowfield properties off the configuration in attached flow, and planform longitudinal load distributions. NONLINEAR TWO-DIMENSIONAL SAIL THEORY

Jean-Marc Vanden-Broeck Oct. 1981 20 p refs
(Contract DAAG29-80-C-0041; Grant NSF MCS-79-27062)
(AD-A110450; MRC-TSR-2293) Avail: NTIS HC A02/MF A01 CSCL 01/3

Steady two-dimensional flow past a sail is considered. The sail is assumed to be supported by two masts. The flow and the shape of the sail are determined as functions of the direction alpha of the flow at infinity and the Weber number lambda. The full nonlinear problem is formulated as an integro-differential equation for the shape of the sail. This equation is discretized and solved numerically by Newton's method. Sail profiles, the slack in the sail, and the lift coefficient are presented for various values of alpha and lambda. GRA

ON THE AERODYNAMICS OF WINDBLAST Final Technical Report

Daniel J. Schneck 13 Nov. 1981 51 p refs
(Grant AF-AFOSR-3706-78)
(AD-A110495; VPI-E-81-31; AFOSR-82-0031TR) Avail: NTIS HC A04/MF A01 CSCL 20/4

In two previous reports (Schneck, 1976, 1979) a mathematical theory was developed in order to calculate the aerodynamic loading to which a pilot is exposed during high speed ejections. Neglecting the effects of flow separation, preliminary results suggested that the pilot's musculo-skeletal resistance is not likely to withstand the tendency for dislodgement from a restraining surface if he is ejecting at Mach numbers exceeding 0.72. Recently (Schneck, 1979) the mathematical theory of windblast was modified to include some effects of flow separation. In the report that follows, these effects are examined in greater detail, particularly as they affect the time-course of limb dislodging forces after the onset of windblast. GRA

EXPERIMENTAL ANALYSIS OF THE EFFECTS OF SWEEP AND ASPECT RATIO ON INCOMPRESSIBLE FLOW ABOUT FORWARD SWEPT WINGS M.S. Thesis

Paul W. Savage Dec. 1981 142 p refs
(AD-A111128; AFIT/GAE/AA/81D-26) Avail: NTIS HC A07/MF A01 CSCL 01/3

Low speed wind tunnel tests were conducted on nine wing planforms to determine the effect of sweep and aspect ratio on forward swept wings in incompressible flow. Sweep angles tested were -15, -30 and -45 degrees. Aspect ratios ranged from 2.05 to 4.79. A NACA 0006 airfoil section perpendicular to the leading edge was used for all models. Results showed increasing negative sweep decreased lift curve slope and shifted the aerodynamic center rearward. Increasing aspect ratio increased lift curve slope, decreased drag coefficient and shifted the aerodynamic center rearward. The wind tunnel aerodynamic data were compared to the Air Force Flight Dynamics Laboratory's Large Aircraft Performance Prediction Program to determine the program's ability to predict forward swept wing aerodynamic coefficients. At incompressible Mach numbers, the program was found to be accurate in predicting lift curve slope in the linear range using a positive sweep input. Drag Polar slope and moment coefficient were accurately predicted for lift coefficients below 0.4 using a negative sweep angle input. Neither positive nor negative angle input predicted maximum lift coefficient accurately. Author (GRA)

is independent of exciting frequency. The eigenfrequencies located in a given small interval and their proper damping values and eigenvibrational modes are determined. Finally, potential generalizations from the procedure are applied to several variant cases. C.D.

A82-32137 **Transformation relations for singularity avoidance in three-dimensional trajectory optimization (Transformationsbeziehungen bei der Optimierung dreidimensionaler Flugbahnen zur Umgehung von Singularitäten).** G.-C. Shau (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Dynamik der Flugsysteme, Obepfaffenhofen, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung,* vol. 6, Mar.-Apr. 1982, p. 90-98. 6 refs. In German.

Problems in calculating the line of flight of an aircraft can be solved by referring the flight motion to a geodetic set of axes, translating the speed and power to that set. The equations of motion can then be written according to Newton's laws, and the right sides of these equations and their adjoint differential equations are regularly differentiable. Based on the Hamilton-Jacob theory, a procedure for translating adjoint variables to geodetic coordinates with the help of given variables in aerodynamical coordinates, and vice-versa, is developed. This will make it possible to switch the system of equations to each iteration state without losing the intermediate results. A concrete example of flight condition at 90 degrees is analyzed. C.D.

A82-32159 **Hydrogen economy assessment for long-term energy systems in Japan.** T. Ohtsuka (Tohoku University, Sendai, Japan), M. Akiyama, T. Saito, Y. Ishizaki, A. Suzuki (Tokyo, University, Tokyo, Japan), N. Negishi, J. Moriya, K. Hoashi, and T. Hoshino (Industrial Research Institute, Tokyo, Japan). *International Journal of Hydrogen Energy,* vol. 7, no. 6, 1982, p. 455-462.

An assessment is made of hydrogen technology development; in particular, economy as an energy carrier, applicability for end-uses and the potential of the market in the future. Specifically, rough static cost comparisons are made on several modes of electricity transmission and hydrogen transport, and on several ways of off-peak electricity saving; including energy storage in the form of hydrogen. Then, the quantity of oil that could be saved from some representative end-use sectors if hydrogen fuel were to be introduced is discussed. Finally, a potential market is assessed, by projecting overall future energy supply/demand dynamics in Japan. (Author)

A82-32202 **Shock associated noise of supersonic jets from convergent-divergent nozzles.** C. K. W. Tam (Lockheed-Georgia Co., Marietta, GA; Florida State University, Tallahassee, FL) and H. K. Tanna (Lockheed-Georgia Co., Marietta, GA). *Journal of Sound and Vibration,* vol. 81, Apr. 8, 1982, p. 337-358. 26 refs. Research supported by the Lockheed Internal Research and Development Funds.

Experimental and theoretical results are presented on the characteristics of shock-associated noise from imperfectly expanded supersonic jets from convergent-divergent nozzles over an extensive range of underexpanded and overexpanded operating conditions. The source of this noise is believed to be the weak but coherent interaction between the downstream-propagating large-scale turbulent flow structures in the mixing layer of the jet and the nearly periodic shock cell system. Reasoning based on this mechanism leads to the scaling formula that the intensity of shock-associated noise varies as (Mj-squared minus Md-squared)-squared, where Mj and Md are the fully expanded jet operating Mach number and the nozzle design Mach number, respectively. A peak frequency formula is also derived from the same model. The noise intensity, directivity, and spectra of supersonic jets from a convergent-divergent nozzle of design Mach number 1.67 were measured in an anechoic chamber over the Mach number range of 1.1 to 2.0. Theoretical results agree very favorably with measurements. B.J.

A82-32223 **Analysis of small-aspect-ratio lifting surfaces in ground effect.** J. N. Newman (MIT, Cambridge, MA). *Journal of Fluid Mechanics,* vol. 117, Apr. 1982, p. 305-314. 5 refs. Research supported by the Australian Research Grants Committee, U.S. Navy, and NSF.

A lifting surface of small aspect ratio is analysed for motion with constant forward velocity, parallel and in close proximity to a rigid plane surface of infinite extent. The gap flow beneath the lifting surface is represented by a simple nonlinear solution in the cross-flow plane, and appropriate conditions are imposed at leading and trailing edges. The transition between these two conditions depends on the kinematics of the gap flow as well as the planform geometry. For steady-state motion of a delta wing with sufficiently large angle of attack, the transition point is upstream of the tail. For oscillatory heaving motion of a delta wing the transition point is cyclic if the heave velocity is sufficiently large. Illustrative computations of the lift force are presented. (Author)

A82-32330 * **Experimental investigation of turbulent wall-jets in the presence of adverse pressure gradients in a rectangular diffuser.** L. Back and R. Cuffel (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *International Journal of Heat and Mass Transfer,* vol. 25, June 1982, p. 871-887. 7 refs. Contracts No. N00019-76-MP-67811; No. NAS7-100.

An experimental study of wall static pressure distributions and mean velocity profiles along a duct and diffuser downstream of wall-jet injection was conducted over a range of diffuser total angles from 15 to 40 deg at injection to core flow mass flux ratios from 0 to 6. Pressure recovery in the diffuser increased with injection ratio and decreased with diffuser total angle. Peak velocities in the wall-jet decayed along the flow and the inner shear layer and outer mixing region grew in thickness along the flow. The inner layer was near similarity condition, but non-similar variations were found in the outer layer. Estimated wall shear stresses depended upon injection mass fluxes, downstream distance and diffuser total angle. Greater decay of peak velocity and larger friction coefficients were found in the diffuser than indicated by correlations from data for a wall-jet without a pressure gradient. At the largest diffuser total angle and the highest injection ratio flow reversal occurred in the core region. (Author)

A82-32624 **British aerospace begins update effort.** *Aviation Week and Space Technology,* vol. 116, May 17, 1982, p. 78, 83, 85, 86, 89.

Among the advanced production technologies selected for installation by British Aerospace Corporation's Aircraft Group are: semi-automated carbon fiber production, super plastic forming/diffusion bonding (SPF-DB) of bond titanium and aluminum alloys, and introduction of direct numerical control of manufacturing processes and a CAD/CAM program. Development programs for these technologies are discussed, including a water jet carbon fiber cutting machine, a carbon fiber second fuselage that is easier to assemble, a new forming press for SPF-DB components, a pilot program for SPF-DB production which includes a 500-ton forming press, and numerically controlled robots and machine tools. C.D.

A82-32725 **Nondestructive detection of exfoliation corrosion around fastener holes in aluminum wing skins.** D. J. Hagemaier (Douglas Aircraft Co., Long Beach, CA). *Materials Evaluation,* vol. 40, May 1982, p. 682-685.

Instructions are given for nondestructive inspections performed on the upper and lower wing skin surfaces for the presence of corrosion around fastener holes. Three methods of inspection are involved: contact ultrasonic testing, contact eddy current testing, and automated ultrasonic C-scan testing. Descriptions are given of these methods. With the contact ultrasonic test, corrosion is detected by the loss of a back surface signal. With the contact eddy current test, the phase-sensitive, eddy current instrument is calibrated to yield a maximum response difference between a corroded and uncorroded area. With the ultrasonic C-scan recording test, a flaw gate is set to record a loss of 50% signal amplitude of the back-surface signal. Here, uncorroded areas of the part are recorded, whereas corroded areas do not record. C.R.

A82-32801 † **Mathematical modeling of unsteady separated flow past solid airfoil cascades (Matematicheskoe modelirovanie nestatsionarnogo otryvnogo obtekaniia reshetok telesnykh profilei).** V. N. Kotovskii, M. I. Nisht, and R. M. Fedorov. *Akademiia Nauk SSSR, Doklady,* vol. 263, no. 6, 1982, p. 1326-1330. 7 refs. In Russian.

Unsteady separated flow past solid airfoil cascades is investigated using a complex approach which combines an ideal medium scheme for a finite-thickness body in the case of the main part of the flow with boundary-layer theory in the case of the region directly adjacent to the body surface. With this approach, phenomena as complex as hysteresis in separated flow past solid bodies can be successfully simulated using a computer. It is found that as the dimensionless frequency increases, the hysteresis of the separation point decreases and the hysteresis of the normal profile force coefficient, Cn, increases. It is also shown that hysteresis, in the separation point position and in Cn increases and the hysteresis loop shifts toward the leading edge with decreasing cascade density and increasing mean angle of attack. V.L.

A82-32847 * # **Wind-tunnel wall interference corrections for three-dimensional flows.** M. H. Rizk and M. G. Smithmeyer (Flow Research Co., Kent, WA). *Journal of Aircraft,* vol. 19, June 1982, p. 465-472. 11 refs.

A procedure for the evaluation of wall interference corrections for three-dimensional aircraft configurations is presented. The Mach number and angle-of-attack corrections are obtained by numerically solving the Laplace equation in a parallelepiped with boundary conditions supplied mainly from experimental pressure measurements. A portion of these measurements and other wind-tunnel data required by the procedure may be replaced by theoretical estimates if not available from experiments. The accuracy of the correction results will then depend on the accuracy of these estimates. The correction procedure is applied to an isolated wing and to a wing-tail configuration in a solid-wall wind tunnel. It is found that neglecting twist and camber corrections for the wing effectively increases the tail angle-of-attack correction. Two different Mach number corrections can be calculated for the wing and tail. However, since only one Mach number correction is allowed for both the wing and the tail, and since the wing surface area is larger than the tail surface area, the final correction tends to be closer to the required wing correction. This is a source of error for the tail results. (Author)

A82-32848 # **Finite-element modeling of a fighter aircraft canopy acrylic panel.** J. J. Labra (Southwest Research Institute, San Antonio, TX). *Journal of Aircraft,* vol. 19, June 1982, p. 480-484.

A detailed three-dimensional stress analysis of a canopy aircraft acrylic panel was conducted to investigate the probable cause of a recent in-flight acrylic panel failure. The analysis was made using a general-purpose finite-element computer program. Based in part on this analysis, probable design problems associated with the canopy were identified. The study clearly demonstrates that computer-based technology can be successfully used in determining probable causes of failure in geometrically complex structures. (Author)

A82-32849 # **Structural modification to achieve antiresonance in helicopters.** B. P. Wang, L. Kitis, W. D. Pilkey, and A. Palazzolo (Virginia, University, Charlottesville, VA). *Journal of Aircraft,* vol. 19, June 1982, p. 499-504. 12 refs. Army-supported research.

A design method is developed to create an antiresonance (by modifying structural properties) of a vibrating system under sinusoidal loading. A local modification method in which appendant systems are added to the original structure is used to analyze such systems. Since the original system and added systems are treated entirely separately, this method allows for efficient repetitive searching until the appendant system produces a meaningful reduction in vibration. Finally, the direct design of appendant structures to create antiresonance is presented. These methods are illustrated by numerical results obtained for a 44-degree-of-freedom elastic line helicopter model. (Author)

A82-32850 # **Incompressible symmetric flow characteristics of sharp-edged rectangular wings.** E. S. Larson (Flygtekniska Forsoksanstalten, Stockholm, Sweden). *Journal of Aircraft,* vol. 19, June 1982, p. 508-510. 8 refs. Research supported by the Forsvarets Materielverk.

In a previous study (Larson, 1981), the symmetric aerodynamic characteristics of sharp-edged rectangular wings were obtained by a set of semiempirical analytical formulas that represent Lamar's (1974) extension of the Multhopp solution. A difference between theory and experiment has been noticed, however, in regard to the lift and pitching moment coefficients for all the investigated aspect ratios except A = 1. The present study examines whether this discrepancy is a result of the formulation of the angle of attack squared in combination with the side-edge suction force coefficient. Improved correlation with experiments in incompressible flow up to moderately high angles of attack is obtained by using an alpha to the 5/3 dependence of the side-edge singularity of sharp-edged rectangular wings. C.D.

A82-32920 * # **Cloud top remote sensing by airborne lidar.** J. D. Spinhirne, M. Z. Hansen, and L. O. Caudill (NASA, Goddard Space Flight Center, Greenbelt, MD). *Applied Optics,* vol. 21, May 1, 1982, p. 1564-1571. 10 refs. NASA-supported research.

Observations of cloud top height, backscattering, and signal depolarization have been obtained by a lidar system operating onboard a high-altitude research aircraft. The transmitter for the cloud lidar system is a doubled Nd:YAG laser operating at 5 Hz. The system functions as a fully automated sensor under microprocessor control and operates from a nominal 19-km altitude. Measurements have been acquired over a wide variety of cloud cover in conjunction with passive visible and infrared measurements. Initial observation results are reported. (Author)

A82-32979 **A multifrequency adaptive radar for detection and identification of objects - Results on preliminary experiments on aircraft against a sea-clutter background.** D. T. Gjessing, J. Hjelmstad, and T. Lund (Norges Teknisk-Naturvitenskapelige Forskningsrad, Kjeller, Norway). *IEEE Transactions on Antennas and Propagation,* vol. AP-30, May 1982, p. 351-365. 16 refs.

An experimental model of a simple multifrequency continuous wave (CW) radar system has been developed. Preliminary experiments have been performed in order to illustrate the potential of this radar concept in regard to detection, course ranging, and also identification of low flying aircraft against a sea-clutter background. The radar can be organized so as to measure ocean wave height, wave direction, and wave velocity simultaneously for 15 different ocean wavelengths ranging from 150 m to approximately 6 m. An example of such a directional wave intensity spectrum is given. To illustrate the ranging and the identification potential of the technique in regard to airplanes, two different airplane categories, namely a propeller aircraft (Cessna 172) and a grid jet aircraft (F-16), were flown through the radar beam. The signatures of these two airplanes are shown in two signature domains: spatial distribution of scattering centers and motion pattern. The experimental results confirm theories presented in earlier contributions. It remains to introduce two more domains, namely the space/time coherence properties of the target and its polarization characteristics. (Author)

A82-32992 **Radiating elements for hemispherically scanned arrays.** A. T. Villeneuve (Hughes Aircraft Co., Los Angeles, CA), M. C. Behnke, and W. H. Kummer. *IEEE Transactions on Antennas and Propagation,* vol. AP-30, May 1982, p. 457-462. Contract No. F19268-72-C-0145.

Several types of radiating elements, including single slots covered by dielectric sheets, parasitic dipoles, and surface wave structures, have been investigated with reference to their wide angle scanning capabilities for application in hemispherically scanned arrays. It is shown that by using a combination of a surface wave structure and a parasitic radiator, it is possible to enhance E-plane radiation at the horizon and to broaden the H-plane pattern of a slot radiator in conducting planes and cylinders. The surface wave structure was also used with an eight-element array of slots oriented perpendicular to the array axis. This arrangement enhanced the radiation for a beam at the horizon (endfire) by several dB over that obtained from an array without the surface wave structure. V.L.

A82-33025 # **The aerospace learning process.** W. M. Hawkins (Lockheed Corp., Burbank, CA). *American Institute of Aeronautics and Astronautics, International Annual Meeting and Technical Display, Baltimore, MD, May 25-27, 1982, Paper 82-1291.* 6 p.

A number of projects significant in the history of aerospace are reviewed and lessons to be learned are stated. The role of private industry and government in the design and production of the Hudson, the P-38, the F-80, the C-130, the Discoverer, the Polaris, and the Reentry Test Vehicle are discussed. It is contended that high quality can be achieved with significant savings of time and money

CANNIBALIZATION OF THE F-14 AND S-3A AIRCRAFT: A VIABLE LOGISTIC M.S. Thesis
Kevin M. Myette Mar. 1981 112 p refs
(AD-A111207) Avail: NTIS HC A06/MF A01 CSCL 05/1

This thesis presents the results of an analysis of cannibalization and its effects on the F-14A and S-3A aircraft. The analysis includes cannibalization measurement methodologies, reasons why squadrons cannibalize, a comparison of fleet cannibalization activity and alternatives to cannibalization. Cannibalization is shown not to be a maintenance practice to be avoided at all cost, but rather a viable cost effective alternative to logistic failures. Additionally, material issue response delays rather than material shortages were found to lead to increased cannibalization. Author (GRA)

EXPERIMENTAL AND ANALYTICAL RESULTS OF TANGENTIAL BLOWING APPLIED TO A SUBSONIC V/STOL INLET
Richard R. Burley and Danny P. Hwang 1982 18 p refs Proposed for presentation at the 18th Joint Propulsion Conf., Cleveland, 21-23 Jun. 1982; sponsored by AIAA, SAE and ASME
(NASA-TM-82847; E-1217; NAS 1.15:82847) Avail: NTIS HC A02/MF A01 CSCL 01A

Engine inlets for subsonic V/STOL aircraft must operate over a wide range of conditions without internal flow separation. Experimental and analytical investigations were conducted to evaluate the effectiveness of tangential blowing to maintain attached flow to high angles of attack. The inlet had a relatively thin lip with a blowing slot located either on the lip or in the diffuser. The height and width of these slots was varied. Experimentally determined flow separation boundaries showed that lip blowing achieved higher angle of attack capability than diffuser blowing. This capability was achieved with the largest slot circumferential extent and either of the two slot heights. Predicted (analytical) separation boundaries showed good agreement except at the highest angles of attack. S.L.

RIME ICE ACCRETION AND ITS EFFECT ON AIRFOIL PERFORMANCE Ph.D. Thesis. Final Report
Michael B. Bragg Mar. 1982 182 p refs
(Grant NAG3-28)
(NASA-CR-165599; NAS 1.26:165599) Avail: NTIS HC A09/MF A01 CSCL 01A

A methodology was developed to predict the growth of rime ice, and the resulting aerodynamic penalty on unprotected, subcritical, airfoil surfaces. The system of equations governing the trajectory of a water droplet in the airfoil flowfield is developed and a numerical solution is obtained to predict the mass flux of super cooled water droplets freezing on impact. A rime ice shape is predicted. The effect of time on the ice growth is modeled by a time-stepping procedure where the flowfield and droplet mass flux are updated periodically through the ice accretion process. Two similarity parameters, the trajectory similarity parameter and accumulation parameter, are found to govern the accretion of rime ice. In addition, an analytical solution is presented for Langmuir's classical modified inertia parameter. The aerodynamic evaluation of the effect of the ice accretion on airfoil performance is determined using an existing airfoil analysis code with empirical corrections. The change in maximum lift coefficient is found from an analysis of the new iced airfoil shape. The drag correction needed due to the severe surface roughness is formulated from existing iced airfoil and rough airfoil data. A small scale wind tunnel test was conducted to determine the change in airfoil performance due to a simulated rime ice shape. Author

THREE-DIMENSIONAL SEPARATION AND REATTACHMENT
David J. Peake and Murray Tobak Mar. 1982 17 p refs
(NASA-TM-84221; A-8845; NAS 1.15:84221) Avail: NTIS HC A02/MF A01 CSCL 01A

The separation of three dimensional turbulent boundary layers from the lee of flight vehicles at high angles of attack is investigated. The separation results in dominant, large scale, coiled vortex motions that pass along the body in the general direction of the free stream. In all cases of three dimensional flow separation and reattachment, the assumption of continuous vector fields of skin friction lines and external flow streamlines, coupled with simple laws of topology, provides a flow grammar whose elemental constituents are the singular points: the nodes, spiral nodes (foci), and saddles. The phenomenon of three dimensional separation may be construed as either a local or a global event, depending on whether the skin friction line that becomes a line of separation originates at a node or a saddle point. INVESTIGATION OF UPWIND SCHEMES FOR FINITE ELEMENT ANALYSIS OF TRANSONIC FLOW OVER THIN AIRFOILS M.S. Thesis
Dennis L Hunt Dec 1981 93 p refs
(AD-A111168. AFIT/GAE/AA/81D-15) Avail NTIS HC A05/MF A01 CSCL 20/4

Two finite element upwind techniques were investigated to see if convergent solutions could be obtained from the transonic potential equation for steady flow over thin airfoils. The first technique involves the use of parabolic upwind functions, that when added to the shape functions weight the upstream node in the supersonic region more than the downwind nodes. The second technique integrates the finite element equations over the area that influences the solution (i.e., the area inside a mach cone) Author (GRA)

STARTING TRANSIENTS IN SUPERSONIC NOZZLES AND NOZZLE-DIFFUSER ASSEMBLIES M.S. Thesis
Thomas Gregory Gates Dec. 1981 47 p refs
(AD-A111143. AFIT/GA/AA/81D-6) Avail NTIS HC A03/MF A01 CSCL 20/4

In this investigation, the flow processes involved in shock induced starting of nozzles and diffusers similar to those used in gasdynamic lasers were studied. Two geometrically similar nozzles were used. The throat opening in the large single nozzle was 0.276 inches. The other was an array of nine nozzle passages in which the throat opening was 0.069 inches. Downstream of the nine nozzles were nine diffusers whose minimum opening was 0.286 inches. These 2-dimensional nozzles and diffusers were 0.75 inches thick. A fully started condition of uniform supersonic flow was achieved throughout the entire test area for both test sections. The processes leading to this condition were highly dynamic and complicated. It was found that successful starting depended not only on the initial diaphragm pressure ratio, but also the downstream test cell configuration. Starting the large single nozzle was enhanced by an increase of flow channel just downstream from the nozzle. This decreased the strength of the incident shock wave and there by increased the pressure ratio applied across the nozzle. As a result, the gasdynamic starting shock could pass on out of the nozzle at lower shock tube diaphragm pressure ratios than would have been the case if the area had remained constant in the flow channel behind the nozzle. THE FFA WING BODY 81 COMPUTER PROGRAM. A PANEL METHOD FOR DETERMINATION OF AERODYNAMIC CHARACTERISTICS AT SUBSONIC AND SUPERSONIC SPEEDS
Sven G. Hedman and Lars G. Tysell 1982 36 p refs
(Contract FMV-F-INK-82223-78-170-21-001)
(FFA-TN-AU-1601) Avail NTIS HC A03/MF A01

A panel program is extended in order to account for unsymmetric configurations and flow fields symmetric, antisymmetric or unsymmetric to the vertical plane. Input instructions are given. The program calculates pressure distribution for completely specified geometries, wing camber for given load distributions, and wing camber for minimum drag with given values of lift and pitching moment. The body length is divided into intervals each with a distribution of sources or doublets of either constant or linearly varying intensity. The boundary condition is fulfilled on the body surface midway between the ends of an interval. Compressible velocities are obtained by the Goethert rule and alternatively for the wing by a semiempirical compressibility correction method, based on the nonlinear compressibility effects in the flow about two-dimensional and sheared wings. Comparison of results with known data shows that the program works best for subsonic load calculations, involving elastic airplanes.

MODIFIED VERSION OF LTRAN2: A CALCULATION METHOD FOR INVISCID TRANSONIC FLOW ABOUT THIN AIRFOILS IN MODERATELY SLOW UNSTEADY MOTION
J. vanderVooren and G. H. Huizing 26 Jun. 1980 54 p refs
(Contract NIVR-1814)
(NLR-TR-80059-U) Avail NTIS HC A04/MF A01

A method for strictly slow unsteady motions is modified by including extra unsteady terms in the boundary conditions. The unsteady transonic small perturbation equation and the airfoil, wake and far field boundary conditions are derived heuristically. A radiation condition on the far field boundary which accommodates outgoing disturbances only is presented. Analysis shows that the infinite physical domain surrounding the airfoil can not be mapped onto a finite computational domain. Numerical experiments on an airfoil oscillating in pitch at reduced frequencies 0.05 and 0.1 for a freestream Mach number = 0.85, and zero angle of attack show that radiation condition can reduce the computational domain and the number of grid points.

COMPARISON OF BOUNDARY LAYER CALCULATIONS FOR THE ROOT SECTION OF A WING. THE SEPTEMBER 1979 AMSTERDAM WORKSHOP TEST CASE
J. P. F. Lindhout, B. vandenBerg, and A. Elsenaar 6 Mar. 1981 71 p refs
(NLR-MP-80028-U) Avail NTIS HC A04/MF A01

Integral and field method calculations of three-dimensional turbulent boundary layer development, including separation, on the root section of a swept wing are compared. Although the predicted position of the separation region varies, all methods give a good global impression of the state of the nonseparated part of the three-dimensional boundary layer. In the weakly three-dimensional region of the flow, agreement between the results is very good. In the strongly three-dimensional region, variation is considerable. Field methods vary more than integral methods. The integral methods are on average ten times faster than the field methods. Author (ESA)

THE PROBLEM OF CALCULATION OF THE FLOW AROUND HELICOPTER ROTOR BLADE TIPS
H. Stahl 19 Aug. 1981 22 p refs Presented at 7th European Rotorcraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany, 8-11 Sep. 1981; sponsored by DGLR
(MBB-UD-330-81-O) Avail NTIS HC A02/MF A01

Computational problems that arise with the theoretical analysis of the flow around rotary wing blade tips are evoked. The modification of existing computer programs in order to handle three-dimensional, unsteady, rotational flow that, on the advancing blade in fast forward flight, can also be transonic is discussed. Potential flow theory is presented. A program for steady three-dimensional flow past a fixed wing was adapted for a rotating blade, taking into account the irrotational condition of the applied theory. Calculations show that this approach leads to an acceptable description of the actual flow Author (ESA)

PROGRAM PRESENTATION OF THE WORKING GROUP SEPARATED FLOW: PROBLEMS WITH ROTARY WINGS [PROGRAM-PRAESENTATION DER ARBEITSGEMEINSCHAFT STROEMUNGEN MIT ABLOESUNGEN (STAB): THEMENKREIS DREHFLUEGEL]
G. Polz 19 Mar. 1981 19 p In GERMAN
(MBB-UD-336-81-O) Avail NTIS HC A02/MF A01

With reference to propellers and rotors, relevant separation phenomena and their resulting effects are described. These include stress induced separation at the blade tip associated with high Mach numbers, separation due to exceeding maximum lift for low Mach numbers, and vortex induced separation. Cause/effect relationships with advancing blade tip vortices are emphasized. All of these separation phenomena have a negative influence on performance and economy in flight management. As for helicopter rotors, the identified extremely high dynamic flight loads can cause acute structural loading and vibration. Minimization of flow separation and its effects is possible by improving blade profiles, optimizing blade shapes (planform/warpage), and by developing blade tips. Author (ESA)

EVALUATION OF A VOICE RECOGNITION SYSTEM FOR

THE MOTAS PSEUDO PILOT STATION FUNCTION
Jacob A. Houck Apr. 1982 57 p refs
(NASA-TM-84487; NAS 1.15:84487) Avail: NTIS HC A04/MF A01 CSCL 17G

The Langley Research Center has undertaken a technology development activity to provide a capability, the mission oriented terminal area simulation (MOTAS), wherein terminal area and aircraft systems studies can be performed. An experiment was conducted to evaluate state-of-the-art voice recognition technology and specifically, the Threshold 600 voice recognition system to serve as an aircraft control input device for the MOTAS pseudo pilot station function. The results of the experiment using ten subjects showed a recognition error of 3.67 percent for a 48-word vocabulary tested against a programmed vocabulary of 103 words. After the ten subjects retrained the Threshold 600 system for the words which were misrecognized or rejected, the recognition error decreased to 1.96 percent. The rejection rates for both cases were less than 0.70 percent. Based on the results of the experiment, voice recognition technology and specifically the Threshold 600 voice recognition system were chosen to fulfill this MOTAS function. Author

LEADING EDGE FLAP SYSTEM FOR AIRCRAFT CONTROL AUGMENTATION Patent Application
Dhanvada M. Rao, inventor (to NASA) (Old Dominion Univ.) Filed 10 Sep. 1981 15 p Sponsored by NASA
(NASA-Case-LAR-12787-1; US-Patent-Appl-SN-301078) Avail: NTIS HC A02/MF A01 CSCL 01C

Traditional roll control systems such as ailerons, elevons or spoilers are least effective at high angles of attack due to boundary layer separation over the wing. Independently deployed leading edge flaps on the upper surfaces of vortex stabilized wings are used to shift the center of lift outboard. A rolling moment is created that is used to control roll in flight at high angles of attack. The effectiveness of the rolling moment increases linearly with angle of attack. No adverse yaw effects are induced. In an alternate mode of operation, both leading edge flaps are deployed together at cruise speeds to create a very effective airbrake without appreciable modification in pitching moment. Little trim change is required. NASA

STATISTICAL REVIEW OF COUNTING ACCELEROMETER DATA FOR NAVY AND MARINE FLEET AIRCRAFT FROM 1 JANUARY 1962 TO 30 JUNE 1981 Semiannual Summary Report
Warren J. Williams 1 Nov. 1981 149 p
(AD-A110660; NADC-13920-2) Avail: NTIS HC A07/MF A01 CSCL 01/1

This is a semi-annual progress report, and it presents a specialized summary of the data in the counting accelerometer program. Statistics describing Navy and Marine aircraft cumulative g-count exceedances are calculated and tabulated. These tabulations are separated by calendar time and into four major categories of fleet experience: Navy Training, Navy Combat, Marine Training and Marine Combat. These data show that the load rate distributions (counts at 1000 hours) for most models and most g-levels have a non-normal distribution. Within a model (A-7E, F-4N, etc.) differences in the average load rates exist when data are separated by calendar time or mission category. Author (GRA)

The feasibility of a fireproof two-fluid brake hydraulic system which utilizes nonflammable chlorotrifluoroethylene (CTFE) fluid in a dead ended brake hydraulic system mechanically isolated from the primary MIL-H-5606 hydraulic system was studied. Experimental brake system hardware was designed, built and laboratory tested. Results indicate that the fireproof two-fluid

Environmental fog/rain visual display system for aircraft simulators [NASA-CASE-ARC-11158-1] N82-24212

Airbus industry and noise in the community [SNIAS-821-111-111] N82-24739

OV-10A nose gear fork damage analysis [AD-A111492] N82-25244

Roll response criteria for transport aircraft with advanced flight control systems in the landing approach and touchdown [NLR-TR-80103-U] N82-25265

AIRCRAFT MANEUVERS

Development of a control law for the alleviation of maneuver loads on an elastic aircraft A82-34144

Simulator for air-to-air combat versus real world: Visual cue analysis for simulated air-to-air combat training [AD-A110570] N82-25270

AIRCRAFT MODELS

Method for the measurement of elastic deformations of aircraft models in a wind tunnel A82-34162

AIRCRAFT NOISE

No-tail-rotor helicopter tests continue A82-33095

AIRCRAFT PARTS

Aerodynamics. Part 2 - Methods of aerodynamic design /3rd revised and enlarged edition/ --- Russian book A82-33387

Fatigue life prediction of helicopter pitch link using Kaman life calculation methods A82-34125

Electro-hydraulic nose wheel steering of the Dornier 228 A82-34373

AIRCRAFT PERFORMANCE

Aircraft evaluation in air network planning A82-33125

XV-15 - Foretelling things to come A82-33914

Military aircraft - The way ahead A82-34110

The effect of very heavy rain upon aircraft and its role in wind shear attributed accidents N82-25179

AIRCRAFT PRODUCTION

British aerospace begins update effort A82-32624

From the A 300 to the A 310 A82-33542

AIRCRAFT RELIABILITY

Opportunities for wind-tunnel/flight correlation with new Boeing airplanes N82-25206

AIRCRAFT SAFETY

Runway end intersection design A82-33904

Instrumentation for testing aircraft antistatic protection [ONERA, TP NO. 1982-7] A82-34495

AIRCRAFT STABILITY

Identification of the form of motion of an aircraft A82-31824

A unified and generalized definition of static longitudinal stability in aircraft A82-32135

Calculation of the lift distribution and aerodynamic derivatives of quasi-static elastic aircraft A82-34639

AIRCRAFT STRUCTURES

Finite element analysis of some aerospace shell structures A82-33515

Understanding aircraft structures --- Book A82-33625

An algorithm for calculating the compliance matrices of aircraft structures by the substructure method as applied to aeroelasticity problems A82-34161

Solution of creep problems by a finite element method A82-34172

A method of accounting for the effect of aircraft deformations on its loading A82-34177

Unistructure - A new concept for light weight integrally stiffened skin structure A82-34486

Calculation of the lift distribution and aerodynamic derivatives of quasi-static elastic aircraft A82-34639

Aerodynamic coefficient identification of time-varying aircraft system and its application A82-34645

A review and assessment of fatigue crack growth rate relationships for metallic airframe materials A82-34879

A method for determining the aeroelastic behavior of aircraft with active control systems [ESA-TT-719] N82-24211

Standard tests for toughened resin composites --- for aircraft structures [NASA-RP-1092] N82-24301

Aerodynamics/ACEE: Aircraft energy efficiency [NASA-FACTS-94/8-81] N82-25241

Mechanical properties of hot isostatic pressed P/M-titanium for helicopter components [MBB-UD-324-81-O] N82-25383

Panel Optimization with Integrated Software (POIS). Volume 1: PANDA: Interactive program for preliminary minimum weight design [AD-A110963] N82-25404

AIRCRAFT TIRES

Tire tread temperatures during antiskid braking and cornering on a dry runway [NASA-TP-2009] N82-24193

AIRFIELD SURFACE MOVEMENTS

Runway end intersection design A82-33904

AIRFOIL PROFILES

Material flow and defect formation in forging an airfoil shape from metal-matrix composites A82-33995

Structural optimization of a swept wing on the basis of the aileron efficiency condition A82-34145

The initial lift and drag of an impulsively started airfoil of finite thickness A82-34538

AIRFOILS

Calculations of viscous transonic flow over aerofoils [AIAA PAPER 82-0997] A82-31957

A numerical study of the turbulent flow past an isolated airfoil with trailing edge separation [AIAA PAPER 82-0998] A82-31958

Mathematical modeling of unsteady separated flow past solid airfoil cascades A82-32801

Effects of dynamic stall on SWECS --- Small Wind Energy Conversion System A82-33707

Turbulent boundary-layer development on a two-dimensional aerofoil with supercritical flow at low Reynolds number A82-34398

Contact problems involving the flow past an inflated aerofoil A82-34851

Rime ice accretion and its effect on airfoil performance [NASA-CR-165599] N82-24166

An experimental investigation of the flow field of an ejector wing design employing a photon correlation laser velocimeter [AD-A111134] N82-24182

Adaptive-wall wind-tunnel research at NASA-Ames Research Center [NASA-TM-84236] N82-24214

A harmonic analysis method for unsteady transonic flow and its application to the flutter of airfoils [NASA-CR-3537] N82-25194

AIRFRAME MATERIALS

A review and assessment of fatigue crack growth rate relationships for metallic airframe materials A82-34879

Materials and structures/ACEE [NASA-FACTS-117/8-81] N82-25242

AIRFRAMES

Development of experimentally compatible subsystem methods for the analysis of aircraft structures [AD-A111242] N82-24198

Structures testing analysis real-time network (STARNET)
[AD-A111626] N82-25827
AIRLINE OPERATIONS
Aircraft evaluation in air network planning A82-33125
Principles of efficient energy use at Interflug A82-33250
Simulation reaches towards reality A82-33547
Essentials of aviation management /2nd edition/ --- Book A82-33648
The U.S. airline industry - En route to deregulation A82-33920
AIRPLANE PRODUCTION COSTS
Very large aircraft - A common response to a rapidly changing global environment
[AIAA PAPER 82-0799] A82-31979
AIRPORT PLANNING
Primary sewage treatment plant as a source of bird hazards at airport A82-33523
Runway end intersection design A82-33904
AIRPORTS
A documented example of strong wind-shear A82-33274
Primary sewage treatment plant as a source of bird hazards at airport N82-26184
AIRSPACE
The National Airspace System plan A82-33893
ALASKA
Airborne gamma-ray spectrometer and magnetometer survey. Ikpikpuk River quadrangle, Alaska, volume 2
[DE82-000314] N82-24620
Airborne gamma-ray spectrometer and magnetometer survey. Umiat quadrangle, Alaska, volume 2
[DE82-000312] N82-24632
ALGORITHMS
An aircraft sensor fault tolerant system
[NASA-CR-165876] N82-25236
ALIGNMENT
Testing of the Kuiper Airborne Observatory 91-CM telescope
[NASA-CR-166341] N82-25040
ALUMINUM
Nondestructive detection of exfoliation corrosion around fastener holes in aluminum wing skins A82-32725
ALUMINUM ALLOYS
Formability of INCOLOY alloy MA 956 - An oxide dispersion strengthened sheet alloy A82-33994
ANALOG SIMULATION
Design, fabrication and testing of an electrical analogue for heat transfer to coated turbine blade A82-33520
ANGLE OF ATTACK
Wind-tunnel wall interference corrections for three-dimensional flows A82-32847
Experimental and analytical results of tangential blowing applied to a subsonic V/STOL inlet
[NASA-TM-82847] N82-24165
F-15 rotary balance data for an angle-of-attack range of 8 deg to 90 deg
[NASA-CR-3478] N82-24168
Rotary balance data for an F-15 model with conformal fuel tanks for an angle-of-attack range of 8 deg to 90 deg
[NASA-CR-3516] N82-24169
Tunnel-to-tunnel correlation N82-25200
Water tunnel flow visualization and wind tunnel data analysis of the F/A-18 --- leading edge extension vortex effects
[NASA-CR-165859] N82-25215
ANNULAR NOZZLES
Three dimensional mean velocity and turbulence characteristics in the annulus wall region of an axial flow compressor rotor passage
[NASA-CR-169003] N82-25252
ANTENNA ARRAYS
Outline of a multiple-access communication network based on adaptive arrays A82-34607
ANTENNA RADIATION PATTERNS
Measuring LF and HF antenna radiation patterns by means of a helicopter A82-34772
Radar frequency radiation
[AD-A111852] N82-25424
ANTIMISTING FUELS
Investigation of the application of a cryogenic blending process to produce antimisting diesel fuels
[AD-A110917] N82-25399
APERTURES
Diffraction by a finite strip A82-33605
APPROACH
Roll response criteria for transport aircraft with advanced flight control systems in the landing approach and touchdown
[NLR-TR-80103-U] N82-25265
AQUEOUS SOLUTIONS
Evaluation of three percent Aqueous Film Forming Foam (AFFF) concentrates as fire fighting agents --- JP-4 jet fuel fires
[AD-A110821] N82-25402
ARCHITECTURE (COMPUTERS)
Electronic Warfare Avionics Integration Support Facility support processor
[AD-A111641] N82-25249
An assessment of the real-time application capabilities of the SIFT computer system
[NASA-TM-84482] N82-25411
AREA NAVIGATION
Flight evaluation of Loran-C for general aviation area navigation A82-33049
Applications of a multiplexed GPS user set A82-33050
ATMOSPHERIC CHEMISTRY
Radiation enhancement by nonequilibrium during flight through the Titan atmosphere
[AIAA PAPER 82-0878] A82-31883
ATMOSPHERIC COMPOSITION
In situ ozone data for comparison with laser absorption remote sensor: 1980 PEPE/NEROS program
[NASA-TM-84471] N82-25661
ATMOSPHERIC ELECTRICITY
Instrumentation for testing aircraft antistatic protection
[ONERA, TP NO. 1982-7] A82-34095
ATMOSPHERIC SOUNDING
Cloud top remote sensing by airborne lidar A82-32920
ATTITUDE CONTROL
Marine Air Traffic Control and Landing System (MATCALS Investigation), volume 2
[AD-A110863] N82-24189
Use of the Pseudo-inverse for design of a reconfigurable flight control system
[AD-A111172] N82-25264
ATTITUDE INDICATORS
Sideslip indication system as a fuel saving aid in jet transport aircraft operation --- a-300 and a-310 aircraft N82-25181
AUTOMATIC CONTROL
British aerospace begins update effort A82-32624
Hydraulic actuator mechanism to control aircraft spoiler movements through dual input commands
[NASA-CASE-LAR-12412-1] N82-24205
AUTOMATIC FLIGHT CONTROL
Automation of the synthesis of control in a stationary linear system --- for aircraft flight control A82-34464
Flight management computer
[SNIAS-821-111-110] N82-24842
Production of Reliable Flight Crucial Software: Validation Methods Research for Fault Tolerant Avionics and Control Systems Sub-Working Group Meeting
[NASA-CP-2222] N82-24845

Aerodynamic noise generated by jet-wing/flap interactions of the external USB configuration of STOL aircraft. Part 1: Eight percent scale cold-flow model analysis [NAL-TR-685T] N82-22953

SIGNAL PROCESSING

Distributed airborne array concepts A82-31669

La Recherche Aerospatiale, bi-monthly Bulletin number 1981-5, September - October 1981 --- aerospace R and T methodology and instrumentation [ESA-TT-725] N82-22145

SIGNAL TO NOISE RATIOS

Distributed airborne array concepts A82-31669

SKIN (STRUCTURAL MEMBER)

Design considerations and experiences in the use of composite material for an aeroelastic research wing [AIAA 82-0678] A82-30146

SOARING

Soaring Society of America, National Convention, Phoenix, AZ, January 14-18, 1981, Proceedings A82-29414

SOLAR SENSORS

Sun sensing guidance system for high altitude aircraft [NASA-CASE-FRC-11052-1] N82-23231

SOOT

Investigation of soot and carbon formation in small gas turbine combustors [NASA-CR-167053] N82-22267

SOUND GENERATORS

Experiments on propeller noise N82-22978

SOUND TRANSMISSION

Analytical prediction of the interior noise for cylindrical models of aircraft fuselages for prescribed exterior noise fields. Phase 2: Models for sidewall trim, stiffened structures and cabin acoustics with floor partition [NASA-CR-165869] N82-22952

SOUND WAVES

Unsteady ejectors N82-23171

SPACE COMMUNICATION

Extravehicular Activity/Air Traffic Control (EVA/ATC) test report --- communication links to the astronaut [NASA-CR-167600] N82-23381

SPACE SHUTTLE ORBITERS

Comparison of analytical predictions of longitudinal short period pilot-induced oscillations with results from a simulation study of the space shuttle orbiter [NASA-TM-83267] N82-23236

SPACE SHUTTLE PAYLOADS

Research and development at MBB. Technical and scientific publications, 1981 N82-23137

SPACE SHUTTLES

Development and demonstration of manufacturing processes for fabricating graphite/LARC 160 polyimide structural elements [NASA-CR-165809] N82-22315

SPACE TRANSPORTATION SYSTEM

Research and Technology annual report FY-1981 [NASA-TM-84199] N82-24137

SPACECRAFT CONSTRUCTION MATERIALS

Development and demonstration of manufacturing processes for fabricating graphite/LARC 160 polyimide structural elements [NASA-CR-165809] N82-22315

SPACECRAFT CONTROL

Comparison of analytical predictions of longitudinal short period pilot-induced oscillations with results from a simulation study of the space shuttle orbiter [NASA-TM-83267] N82-23236

SPACECRAFT DESIGN

Research and development at MBB. Technical and scientific publications, 1981 N82-23137

SPACECRAFT STRUCTURES

Development and demonstration of manufacturing processes for fabricating graphite/LARC 160 polyimide structural elements [NASA-CR-165809] N82-22315

SPECTRAL BANDS

Program for narrow-band analysis of aircraft flyover noise using ensemble averaging techniques [NASA-CR-165867] N82-22949

SPIN TESTS

Prototype flywheel spin testing program [UCRL-15381] N82-22499

SPLIT FLAPS

Experimental flight test programs for improving combat aircraft maneuverability by maneuver flaps and pylon split flaps N82-22192

SPOILERS

Analysis and flight evaluation of a small, fixed-wing aircraft equipped with hinged plate spoilers [NASA-CR-166287] N82-22243

The 737 graphite composite flight spoiler flight service evaluation [NASA-CR-165826] N82-22318

SPOT WELDS

Production weldbonding on the A-10 aircraft A82-28995

A comparison of properties of single overlap tension joints prepared by ultrasonic welding and other means [AIAA 82-0661] A82-30091

SQUEEZE FILMS

Basic technology of squeeze-film dampers for rotor dynamics control [AD-A110842] N82-23250

STABILITY AUGMENTATION

Control law design to meet constraints using SYNPAC-synthesis package for active controls [NASA-TM-83264] N82-22280

Unified results of several analytical and experimental studies of helicopter handling qualities in visual terrain flight N82-23215

An assessment of various side-stick controller/stability and control augmentation systems for night nap-of-Earth flight using piloted simulation N82-23216

STABILIZERS (FLUID DYNAMICS)

Pressure measurements on twin vertical tails in buffeting flow [AIAA 82-0641] A82-30138

Bonded aluminum honeycomb - Aircraft flight surface primary structure application [AIAA 82-0676] A82-30145

STABLE OSCILLATIONS

Stability and self-oscillations of coaxial rotors A82-31603

STAGNATION PRESSURE

The excitation of compressor/duct systems A82-28993

STANDARDIZATION

Development and use of dynamic qualification standards for Air Force stores N82-22155

STATE VECTORS

Optimization of measurements in the state estimation of systems using the least squares method A82-29826

STATIC PRESSURE

Static and unsteady pressure measurements on a 50 degree clipped delta wing at M = 0.9 [AIAA 82-0686] A82-30153

Static and unsteady pressure measurements on a 50 degree clipped delta wing at M = 0.9 --- conducted in the Langley Transonic Dynamics Tunnel [NASA-TM-83297] N82-23195

STATIC TESTS

Prediction of flyover jet noise spectra from static tests N82-22963

STATISTICAL ANALYSIS

Review of rotorcraft accidents 1977-1979 [PB82-115601] N82-22237

Program for narrow-band analysis of aircraft flyover noise using ensemble averaging techniques [NASA-CR-165867] N82-22949

STEADY FLOW

Feedback control of a cantilever wing in steady airflow [AIAA 82-0729] A82-30177

STIFFNESS
Damping and stiffness of aligned discontinuous fiber reinforced polymer composites
[AIAA 82-0712] A82-30103
Aeroelastic flutter and divergence of stiffness coupled, graphite/epoxy, cantilevered plates
[AIAA 82-0722] A82-30122
STRAIN RATE
Environmental and high strain rate effects on composites for engine applications
[AIAA 82-0758] A82-30118
STRAINS
Unsteady pressure measurements at stall and buffeting
[DFVLR-MITT-79-05] N82-22155
STRAPDOWN INERTIAL GUIDANCE
Optimal control and estimation for strapdown seeker guidance of tactical missiles A82-31121
Strapdown inertial navigation systems: An algorithm for attitude and navigation computations
[ARL/SYS-REPT-23] N82-22241
STRESS ANALYSIS
The stressed state of a parachute canopy during opening A82-29830
Analysis of shells of straight-wing type A82-29841
A comparison of properties of single overlap tension joints prepared by ultrasonic welding and other means
[AIAA 82-0661] A82-30081
Experimental stress analysis of a thin-walled pressurized torus loaded by contact with a plane --- dynamic response of aircraft tires
[AIAA 82-0753] A82-30116
STRESS CONCENTRATION
Occurrence of fretting fatigue failures in practice A82-28943
STRESS CORROSION CRACKING
Engineering property comparisons of 7050-T73651, 7010-T7651 and 7010-T73651 aluminum alloy plate --- for aircraft construction
[NLR-MP-80047-U] N82-22360
STRESS INTENSITY FACTORS
Integrity analyses of surface-flawed aircraft attachment lugs - A new, inexpensive, 3-D alternating method
[AIAA 82-0742] A82-30107
Environmental and high strain rate effects on composites for engine applications
[AIAA 82-0758] A82-30118
STRESS-STRAIN RELATIONSHIPS
Thermal stability analysis for conical shells with variable parameters A82-29844
STRUCTURAL ANALYSIS
A review of U.S. Air Force research related to airframe and engine materials A82-28288
737 graphite-epoxy horizontal stabilizer certification
[AIAA 82-0745] A82-30109
Environmental and high strain rate effects on composites for engine applications
[AIAA 82-0758] A82-30118
Integrated structural analysis and design support for advanced launch vehicles
[AIAA 82-0675] A82-30144
Bird impact analysis package for turbine engine fan blades
[AIAA 82-0696] A82-30162
A linear decomposition method for large optimization problems. Blueprint for development
[NASA-TM-83248] N82-22205
STRUCTURAL DESIGN
Structures, Structural Dynamics and Materials Conference, 23rd, New Orleans, LA, May 10-12, 1982, Collection of Technical Papers. Part 1 - Structures and materials. Part 2 - Structural dynamics and design engineering A82-30076
Finite element analysis of through the canopy emergency crew escape from the T-38 aircraft
[AIAA 82-0705] A82-30096
Integrated structural analysis and design support for advanced launch vehicles
[AIAA 82-0675] A82-30144
Damage tolerant design using collapse techniques
[AIAA 82-0716] A82-30140
A linear decomposition method for large optimization problems. Blueprint for development
[NASA-TM-83248] N82-22205
Application of a structural optimization procedure for advanced wings
[illegible] [illegible]
STRUCTURAL DESIGN CRITERIA
Tool use in cutting operations involving integral structural components in aircraft construction A82-28872
Durability and damage tolerance control plans for USAF aircraft
[AIAA 82-0679] A82-30147
Application of a structural optimization procedure for advanced wings
[illegible] N82-22181
Some case studies and the significance of fatigue thresholds --- aircraft components
[NLR-MP-81018-U] [illegible]
STRUCTURAL ENGINEERING
Occurrence of fretting fatigue failures in practice A82-28943
STRUCTURAL FAILURE
Occurrence of fretting fatigue failures in practice A82-28943
Damage tolerant design using collapse techniques
[AIAA 82-0716] A82-30140
On the dynamic collapse of a column impacting a rigid surface
[AIAA 82-0738] A82-30142
STRUCTURAL RELIABILITY
Structural integrity of an adhesively bonded aircraft fuselage [illegible]
Durability and damage tolerance control plans for USAF aircraft
[AIAA 82-0679] A82-30147
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-165841] N82-22316
STRUCTURAL STABILITY
Analysis of a [illegible] [illegible] with allowance for shear strain [illegible]
The stability of [illegible] panels under bending A82-29836
Effect of operating life on the mechanical properties of the materials and load-bearing capacity of the rotor elements of gas-turbine engines A82-31083
STRUCTURAL VIBRATION
An automated technique for improving modal test/analysis correlation
[AIAA 82-0640] A82-30137
Pressure measurements on twin vertical tails in buffeting flow
[AIAA 82-0641] A82-30150
Transonic time-response analysis of three D.O.F. conventional and supercritical airfoils
[AIAA 82-0688] A82-30155
Development of vibration qualification test spectra for the F-15 aircraft N82-22164
Approach to dynamic qualification of light helicopter stores and equipments N82-22166
The dynamic qualification of equipment and external stores for use with rotary winged aircraft N82-22167
[illegible] aircraft structural vibration prediction from acoustic excitation N82-22168
STRUCTURAL WEIGHT
Comparison of light aircraft with strutted and cantilever wings A82-19818
SUBSONIC FLOW
Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 338 reports, journal articles, and other documents originally announced in August 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

and that bureaucracy has been a much greater problem in recent projects than it was in the older ones. Major problems include the cult of systems management, excessive paperwork and meetings, the hardware competition process, and bureaucratic infighting. It is argued that there should be a return to the quick prototype and a single systems manager should preside over projects. Competition for project contracts should be curtailed. C.D.

A82-33049 * **Flight evaluation of Loran-C for general aviation area navigation.** W. M. Hollister, K. Natarajan, and J. A. Littlefield (MIT, Cambridge, MA). *Navigation,* vol. 28, Winter 1981-1982, p. 342-352. 12 refs. Grant No. NGL-22-009-640.

This paper reports on a flight evaluation of Loran-C which was part of a long range study of area navigation systems for general aviation. Tests involved two different Loran-C receivers, 6 different aircraft, and a variety of antennas. Uncorrected position fixes were typically accurate to one quarter mile. With measured corrections, repeatability was good to within 200 ft. Signal reliability was 99.7%. The receiver was not sensitive to atmospheric noise. The time difference grid demonstrated a long term stability of 0.3 microsecond. Vertical whip and ADF E-field antennas were found suitable for airborne use. Loran-C was found satisfactory for instrument approaches to runways at general aviation airports where published latitude-longitude coordinates were available. Accuracy was further improved by using locally measured Loran-C time difference coordinates. (Author)

A82-33050 **Applications of a multiplexed GPS user set.** C. R. Johnson, P. W. Ward, M. D. Turner, and S. D. Roemerman (Texas Instruments, Inc., Lewisville, TX). *Navigation,* vol. 28, Winter 1981-1982, p. 353-369. 7 refs.

A multiplexing GPS receiver has been developed that has many of the advantages of a continuous receiver at the low cost of a sequencing receiver. The multiplexing concept is explained. The receiver architecture is described. Advantages of multiplexing over the conventional receiver are highlighted. Applications of the multiplexing receiver to meet requirements now being met with single-channel, two-channel, and five-channel sets are discussed. Data comparing the performance of this multiplexing to conventional approaches are presented. A multiplexing GPS receiver solves difficult problems. Several of these applications are presented, including angle determination, single-channel differential GPS, area navigation and precision approach, and geodetic surveying. All applications examined have yielded a unique advantage with the multiplexed GPS receiver over a conventional GPS receiver. (Author)

A82-33095 **No-tail-rotor helicopter tests continue.** R. R. Ropelewski. *Aviation Week and Space Technology,* vol. 116, May 24, 1982, p. 57, 60, 61.

The experimental OH-6 helicopter uses a low-pressure air circulation yaw control system, in place of a conventional tail rotor, which consists of a small-diameter fan at the forward end of the tail boom, a slot on the lower right side of the boom, and selectively-controlled exhaust vanes at the extreme rear of the boom which provide direct thrust when additional yaw control is needed. A reduction in noise and vibration levels typical of conventional tail rotors has been demonstrated by the novel directional control system, and it is found that the helicopter's vertical tail becomes effective more quickly in forward flight. Confined-area operation hazards associated with conventional tail rotors have been obviated. Full directional control authority is maintained by the no-tail rotor system at speeds below 30 knots. O.C.

A82-33119 # **Fundamental torsional frequency of a class of solid wings.** E. H. Mansfield (Royal Aircraft Establishment, Farnborough, Hants., England). *AIAA Journal,* vol. 20, June 1982, p. 845-848.

This paper determines the fundamental torsional frequency of certain wings whose polar moment of inertia is proportional to the torsional rigidity at any section, as in a solid wing with a fixed t/c ratio. An inverse method of analysis is used in which the spanwise variation of rigidity and polar moment of inertia is related to an assumed spanwise variation of rotation in the fundamental torsional mode. The usefulness of this apparently hit-or-miss technique stems from the ease with which families of solutions may be generated. The results, which are augmented by a direct solution for wings with a constant taper, are expressed graphically in a form which relates the fundamental torsional frequency to the derived spanwise variation of the chord. (Author)

A82-33120 * # **Closed-form solutions of supersonic wing-body interference.** N. R. Vira and D.-N. Fan (Howard University, Washington, DC). *AIAA Journal,* vol. 20, June 1982, p. 855-857. Contract No. NAS5-24242.

Closed-form formulas are presented for the interference factors of a body in the presence of a wing at supersonic speeds, when a finite afterbody is introduced. In addition, formulas are obtained for those cases in which the base of the body is forward of the trailing edge of the exposed root chord. These formulas are shown to be valid, subject to the restrictions inherent in the formulation given by Pitts, Nielsen and Kaattari (1959). O.C.

A82-33125 **Aircraft evaluation in air network planning.** A. Kanafani and A. Ghobrial (California, University, Berkeley, CA). *ASCE, Transportation Engineering Journal,* vol. 108, May 1982, p. 282-300. 9 refs.

The relationship between aircraft technology and the structure of air service networks in short haul systems is investigated. The analysis is based on an optimal frequency assignment model that is integrated with a route choice model. Together these models allow the optimization of aircraft utilization and define an optimal network structure for a given demand pattern and aircraft technology. Large aircraft have a compelling advantage due to the scale economies they enjoy. Small aircraft, on the other hand, can offer level-of-service advantages and an opportunity for reducing the dependence on congested major transfer hubs in the network. A desirable technology development trend would be aimed at eliminating the diseconomies of distance suffered by small aircraft due to their limited payload-range characteristics. (Author)

A82-33143 # **Ideal ramjet - Optimum M sub infinity for fuel limit and material limit.** J. A. Roux (Mississippi, University, University, MS). *Journal of Spacecraft and Rockets,* vol. 19, May-June 1982, p. 286, 287.

The derivation of some simple algebraic expressions for the value of the freestream Mach number at which the specific impulse obtains a maximum for both the fuel-limited and material-limited cases is presented. Equations are given by which values of the freestream Mach number can be quickly determined. The dependence of this number on the increase in stagnation temperature due to combustion, on the maximum temperature, and on T sub infinity is given in explicit form. C.R.

A82-33250 **Principles of efficient energy use at Interflug (Grundsätze der rationellen Energieanwendung bei der Interflug).** K. Henkes (Ministerium für Verkehrswesen; Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt,* vol. 17, no. 5-6, 1981, p. 214-220. In German.

Attention is given to the problems of efficient energy use in civil aviation, taking into account conditions in the German Democratic Republic and its Interflug airline. It is pointed out that 98% of the energy requirements of Interflug are met with the aid of energy carriers produced from petroleum. These energy carriers are almost exclusively aircraft fuels, and 50% of the fuel is obtained in refueling operations conducted in foreign countries. Interflug has, therefore, been concerned with the implementation of approaches for reducing the performance-related fuel consumption for its aircraft. A reduction in performance-related fuel consumption of 10-16% for each aircraft type could be achieved. This reduction is partly the result of organizational steps leading to a more efficient utilization of the aircraft, and partly the result of a number of suitable technical-technological procedures. Plans are discussed for a further reduction of the requirements for fuel and electric power by a variety of different approaches. G.R.

A82-33274 **A documented example of strong wind-shear.** D. A. Membery (IAL, Bahrain). *Weather,* vol. 37, Jan. 1982, p. 19-22. 5 refs.

It is noted that wind variations likely to be encountered by an aircraft on takeoff or landing are usually estimated from a nearby anemometer some 33 ft above the runway. This wind, however, may not be representative of conditions at higher levels. An urgent need is therefore seen to detect and measure rapid changes in both the horizontal and vertical components up to 1000 ft. A device that can detect rapid velocity changes in clear air by remote sensing techniques is needed. Attention is given to the advances that have been made using a pulsed CO2 laser Doppler system. When an aircraft encounters a sudden decrease in headwind, the indicated airspeed drops by an equal amount. The subsequent lift is somewhat lower than the original value. To immediately correct the situation, power is applied so that the aircraft can regain lost airspeed and climb back to the glide path. The aircraft may at this juncture be in a critical position, where an increase in thrust produces only a slight increase in lift, accompanied by a tremendous increase in drag. C.R.

A82-33309 **Forward-swept-wing technology.** G. Warwick. *Flight International*, vol. 121, May 22, 1982, p. 1317-1319.

The demonstration X-29A forward-swept-wing airplane designed by Grumman is described, and other aspects of forward-swept-wing technology are discussed. The X-29A is powered by a single 16,000 lb thrust General Electric F404 turbofan engine, and combines forward sweep with close-coupled canard, digital fly-by-wire with relaxed static stability, aeroelastic tailoring with composite primary structure, and a thin supercritical airfoil with discrete variable camber. The wing has carbonfiber-epoxy skins and front spar, and a full-depth aluminum honeycomb substructure. Composite construction controls the nose-up twisting which forces the wing to diverge, and divergence speed is increased until it lies outside the X-29A's flight envelope. The wing can sustain higher pressures before shock-induced buffet appears, increasing the usable lift in transonic maneuvers. Canard, variable-camber flaperons and strake flaps are used to trim the aircraft. C.D.

A82-33317 * # **The cryogenic wind tunnel for high Reynolds number testing.** R. A. Kilgore (NASA, Langley Research Center, Hampton, VA). *International Cryogenic Engineering Conference, 9th, Kobe, Japan, May 11-14, 1982, Paper.* 7 p. 9 refs.

An improved way to increase the Reynolds numbers capability of wind tunnels has been developed at the Langley Research Center. Cooling the test gas to cryogenic temperatures by spraying liquid nitrogen into the tunnel circuit increases Reynolds number with no increase in dynamic pressure and a reduction in drive power. In addition, the ability to vary the temperature of the test gas independently of pressure and Mach number allows for the first time the independent determination of Reynolds number, Mach number, and aeroelastic effects. A new fan-driven transonic cryogenic tunnel being built at the Langley Research Center will provide an order of magnitude increase in Reynolds number capability over existing transonic tunnels in the United States when it is completed later this year. (Author)

A82-33318 * # **Generation of three-dimensional boundary-fitted curvilinear coordinate systems for wing/wing-tip geometries using the elliptic solver method.** F. C. Thames (NASA, Langley Research Center, Hampton, VA). *Symposium on the Numerical Generation of Curvilinear Coordinate Systems and the Use in the Numerical Solution of Partial Differential Equations, Nashville, TN, Apr. 13-16, 1982, Paper.* 23 p. 12 refs.

A three-dimensional elliptic solver technique is utilized to generate surface-fitted coordinates about wing/wing-tip configurations. The method is applicable to wings of arbitrary section profile and camber, leading-edge sweep, taper ratio, and spanwise thickness variation. The basic theory of three-dimensional elliptic mappings is developed along with a method to compute interior coordinate control functions. Examples of grids generated about several wing/wing-tip geometries are given. A 49 x 33 x 17 grid requires about 3 minutes of CPU time on a CYBER 203 computer. (Author)

A82-33325 * # **Aerodynamic interactions with turbulent jet exhaust plumes.** R. G. Wilmoth (NASA, Langley Research Center, Hampton, VA). *Joint Army-Navy-NASA-Air Force Interagency Propulsion Committee, Plume Technology Meeting, 13th, Houston, TX, Apr. 27-29, 1982, Paper.* 17 p. 14 refs.

The importance of aerodynamic interactions associated with external flow-field effects on turbulent jet exhaust plume structure is discussed. A viscous/inviscid prediction technique is presented which combines the overlaid mixing and inviscid plume components of the JANNAF Standardized Plume Flow-Field (SPF) model with inviscid external flow and boundary-layer analyses for treating nozzle afterbodies at subsonic/transonic speeds. Validation of the technique via comparisons between predictions and experiment for cold-air jet plumes is presented. Predicted spatial temperature distributions for hot, nonafterburning plumes are presented and compared to results obtained from more simplified prediction techniques in order to assess the importance of the aerodynamic interactions associated with external boundary layers and pressure gradients. It is demonstrated that these interactions play a significant role in determining the near-field turbulent mixing and inviscid plume shock structure. The implication of these results to plume radiation predictions is discussed. (Author)

A82-33326 * # **Status of the national transonic facility.** L. W. McKinney and B. B. Gloss (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerodynamic Testing Conference, 12th, Williamsburg, VA, Mar. 22-24, 1982, Paper 82-0604.* 11 p. 16 refs.

The National Transonic Facility at NASA Langley Research Center, scheduled for completion in July, 1982, is described with emphasis on model and instrumentation activities, calibration plans and some initial research plans. Performance capabilities include a Mach number range of 0.2-1.2, a pressure range of 1-9 atmospheres, and a temperature range of 77-350 K, which will produce a maximum Reynolds number of 120 million at a Mach number of 1.0, based on a 0.25 m chord. A comprehensive tunnel calibration program is planned, which will cover basic tunnel calibration, data qualities, and data comparisons with other facilites and flights. D.L.G.

A82-33327 * # **The NASA Langley laminar flow control airfoil experiment.** W. D. Harvey and J. D. Pride (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerodynamic Testing Conference, 12th, Williamsburg, VA, Mar. 22-24, 1982, Paper 82-0567.* 26 p. 45 refs.

A large chord swept supercritical LFC airfoil has been constructed for NASA-Langley's research program to determine the compatibility of supercritical airfoils with suction laminarization and to establish a technology base for future transport designs. Features include a high design Mach number and shock-free flow, as well as the minimization of the laminarization suction through a choice of airfoil geometry and pressure distribution. Two suction surface concepts and a variety of hybrid suction concepts involving combinations of natural and forced laminar flow are to be investigated. The test facility has been modified to insure achievement of required flow quality and transonic interference-free flow over the yawed LFC airfoil. D.L.G.

A82-33348 **Vertical takeoff technology - Flight mechanics, aerodynamics, and propulsion systems (Senkrechtstarttechnik - Flugmechanik, Aerodynamik, Antriebssysteme).** X. Hafer (Darmstadt, Technische Hochschule, Darmstadt, West Germany) and G. Sachs (München, Hochschule der Bundeswehr, Munich, West Germany). Berlin, Springer-Verlag, 1982. 419 p. 295 refs. In German. $34.50.

An efficient solution of the problem of vertical takeoff for an aircraft is provided by the helicopter. However, with respect to cruising flight operations, the helicopter cannot compete economically with aircraft utilizing conventional takeoff. A special type of aircraft, often called 'powered lift aircraft', is needed to combine the facility of vertical takeoff with the economic cruising flight capabilities found in conventional aircraft. This book is exclusively concerned with the design problems regarding such powered lift aircraft. The book has the objective to present a survey of the development of vertical takeoff technology. It provides also a description of the various possible approaches for a technical solution of the involved problems, taking into account the basic relations of aerodynamics and flight mechanics which have to be considered for the design of systems that provide a vertical-takeoff capability. G.R.

CURRENT DEVELOPMENTS LIGHTER THAN AIR SYSTEMS

Norman J. Mayer 1981 15 p refs Presented at the United Nations Ind. Develop. Organ. Conf., Vienna, 19-22 Oct. 1981
(NASA-TM-84744; NAS 1.15:84744) Avail: NTIS HC A02/MF A01 CSCL 01A

Lighter than air aircraft (LTA) developments and research in the United States and other countries are reviewed. The emphasis in the U.S. is on VTOL airships capable of heavy lift, and on long endurance types for coastal maritime patrol. Design concepts include hybrids which combine heavier than air and LTA components and characteristics. Research programs are concentrated on aerodynamics, flight dynamics, and control of hybrid types. Author

N82-24181# Air Force Inst. of Tech., Wright-Patterson AFB, Ohio. School of Engineering.

EFFECT OF MODIFICATION OF THE TRAILING EDGE OF A SEPARATING WALL ON THE DOWNSTREAM MIXING OF PARALLEL FLOWING STREAMS M.S. Thesis

Daniel J. Gurecki Dec. 1981 76 p refs
(AD-A111124; AFIT/GAE/AA/81D-12) Avail: NTIS HC A05/MF A01 CSCL 20/4

The objective of this thesis is to study ways to enhance the mixing of two parallel streams of air by modifying the trailing edge of a separating wall. An apparatus was designed which achieved two-dimensional, good quality flow near the center of the test section passage, with freestream turbulence intensity of 2.2 percent. Measurements of the wake were made varying the velocity of one stream down to 37.5 percent of the other stream velocity, both in and upstream of the asymptotic region of the wake. A single element hot wire was used to measure velocity and RMS readings. The flat plate trailing edge was then slotted with five, eight millimeter slots and re-tested. The higher turbulence and wider wake of the flat plate indicate that the slotted plate wake does not achieve as good mixing as the flat plate wake. No velocity ratio of the two streams was found to maximize the wake growth for either configuration. Wake growth doubled when the slower velocity was 0.40 of the faster velocity. Author (GRA)

AN EXPERIMENTAL INVESTIGATION OF THE FLOW FIELD OF AN EJECTOR WING DESIGN EMPLOYING A PHOTON CORRELATION LASER VELOCIMETER M.S. Thesis

Damon G. Stephens Dec. 1981 122 p refs
(AD-A111134; AFIT/GAE/AA/81D-30) Avail: NTIS HC A06/MF A01 CSCL 20/2

The flow field about a dual element airfoil model employing an ejector for aerodynamic blowing is investigated. Flow visualization is obtained by smoke tunnel testing. Mean velocities and turbulence intensities are determined at various flow field locations. All data is obtained through the use of a Laser Doppler Velocimeter (LDV) using a photon correlation processing scheme. Flow field properties are computed from the LDV generated autocorrelation function. The free stream velocity and Reynolds number based on model chord length are 8 m/sec and 325,000 respectively. Two ejector velocity ratios are investigated: (U) ejector/(U) free stream = 0. and 2. Flow visiualization photography is conducted at seven angles of attack: -5 deg, 0 deg, 5 deg, 10 deg, 15 deg, 20 deg, and 25 deg and LDV data is acquired at 0 deg and 15 deg angles of attack. The results are presented in the form of flow visualization photographs and profiles of mean velocities and turbulence intensities. Conclusions are drawn concerning the aerodynamic benefit of the ejector wing design for possible V/STOL applications. GRA

ACCOUNTING FOR THICKNESS EFFECTS IN THE CALCULATION OF SUBCRITICAL UNSTEADY AERODYNAMIC FORCES: APPLICATION TO WING-FUSELAGE INTERACTIONS [PRISE EN COMPTE DES EFFETS D'EPAISSEUR DANS LE CALCUL DES FORCES AERODYNAMIQUES INSTATIONNAIRES SURCRITIQUES. APPLICATIONS AUX INTERACTIONS FUSELAGE/SURFACES PORTANTES]

R. Barreau, M. Verdier, and J. P. Robert 7 Jan. 1982 47 p refs In FRENCH Presented at AAAF Colloq., Poitiers, France, 18-20 Nov. 1981
(SNIAS-821-111-108) Avail: NTIS HC A03/MF A01

A calculation method that yields an aerodynamic influence coefficient matrix for infinitely thin wings in a subsonic harmonic flow was modified in order to take into account the presence of a fuselage. A solution was obtained by the doublet lattice method and the method of singularites. Results relate to the development of generalized active control which requires a meticulous and precise knowledge of local unsteady aerodynamic forces. The computer program seems to give coherent results, the presence of a fuselage notably affecting the first chords of the wing. However, the method has not been sufficiently validated by calculations of aeroelastic significance. Author (ESA)

TRANSPORT AIRCRAFT CRASH DYNAMICS Final Report, Jan. 1980 - Mar. 1982

Gil Wittlin, Max Gamon, and Dan Shycoff Atlantic City, N.J. FAA Mar. 1982 471 p refs
(Contract NAS1-16083)
(NASA-CR-165851; NAS 1.26:165851; FAA-CT-82-69) Avail: NTIS HC A20/MF A01 CSCL 01C

Transport airplane accident data is presented. Formulation of candidate crash scenarios, the identification of the involvement of structural systems and subsystems in transport airplane accidents, a review of existing design criteria and philosophy, and conclusions and recommendations for R&D are included. The accident is organized in relation to pertinent accident types including undershoot, overrun, ground collision, obstacle impact, stall, wheels up or retracted landing, swerve and gear collapse. Ground to ground and air to ground crash scenarios are presented. Current state of the art procedures are used in .he analysis of a current airplane configuration for selected accident conditions. Available structure and occupant modeling techniques are assessed with regard to transport airplane crash dynamics modeling requirements. Design criteria and full scale crash tests are evaluated with regard to transport airplane applicability. A integrated crash dynamics analysis and test program for transport airplanes is presented along with conclusions and recommendations based on the results of the overall study. An accident data base computer program is described. S.L.

This report contains the results of the continuation of Marine Air Traffic Control and Landing System (MATCALS) investigations. The report is organized into three main sections, namely Part Two, Part Three, and Part Four. Part Two presents a method of estimating the centroid location of a target utilizing a scan return amplitude versus angle information. Part Three contains the results of an investigation into replacing the alpha-beta filter in the MATCAL digital controller with an observer, in order to reduce the effects of radar noise. Part Four presents the results of an investigation into replacing the same alpha-beta filter with a tri-state adaptive filter, in order to reduce the effects of radar noise. GRA

MARINE AIR TRAFFIC CONTROL AND LANDING SYSTEM (MATCALS INVESTIGATION), VOLUME 2

E. R. Graf, C. L. Phillips, and S. A. Starks Sep. 1981 155 p refs Prepared for Georgia Inst. of Technology, Atlanta 2 Vol.
(AD-A110863; GIT/EES-1-A-2550-Vol-2) Avail: NTIS HC A08/MF A01 CSCL 17/7

Three observers, designed for a reduced order system that represents the lateral system of F4J aircraft in an automatic landing configuration, are discussed. The observers are to be used in the aircrafts' lateral control system to estimate its lateral position and lateral velocity. Results obtained from simulation studies indicate that an observer may be used to improve the system's response. M.D.K.

TIRE TREAD TEMPERATURES DURING ANTISKID BRAKING AND CORNERING ON A DRY RUNWAY
John A. Tanner, Robert C. Dreher, Sandy M. Stubbs, and Eunice G. Smith May 1982 57 p refs
(NASA-TP-2009; L-15110; NAS 1.60:2009) Avail: NTIS HC 04/MF A01 CSCL 01C

Aircraft tire tread temperatures under transient conditions associated with antiskid braking and cornering operations were studied. Peak tread temperatures were shown to be much lower when the braking effort did not reach the incipient skid point than when the tire was forced into incipient skids. Braking operation at high yaw angles increased average tread temperatures. Tire energy dissipation associated with braking and cornering was far greater than that associated with wheel spin-up at touchdown. The maximum friction level developed by a worn tire is shown to be more sensitive to variations in tread temperature and ground speed than that developed by a new tire. Locked-wheel skids and braking and cornering operations at high yaw angle produced molten rubber deposits on the runway surface and tread temperatures high enough to cause the rubber to undergo changes in chemial composition. DEVELOPMENT OF EXPERIMENTALLY COMPATIBLE SUBSYSTEM METHODS FOR THE ANALYSIS OF AIRCRAFT STRUCTURES Final Report, 1 Apr. - 30 Sep. 1981
Sherif T. Noah Nov. 1981 50 p refs
(Grant AF-AFOSR-0141-81)
(AD-A111242; AFOSR-82-0080TR) Avail: NTIS HC A03/MF A01 CSCL 01/3

This study is directed toward the development of experimentally compatible synthesis techniques for the determination of the dynamic characteristics of structures from the characteristics of their components. Based on an assessment of existing methods, selected free-interface component mode methods are utilized for the development. A simple technique is developed by which the residual effects, of truncated substructures' modes, required in forming the synthesis can be directly determined from test data. The data is to be obtained by shaking each of the substructures at a single point. Depending on the type of substructures involved, the inclusion of these residual effects is shown to be very significant in drastically improving the predicted model shapes and damping of their assembly. A method is also presented for extending the selected synthesis formulations to enable their application to non-proportionally damped substructures. The study summarized in this report clearly demonstrates the feasibility of developing general, experimentally compatible synthesis techniques. Recommendations are included for the generalization and further development of the techniques developed in this study. Author (GRA)

EXPERIMENTAL VERIFICATION OF FORCE DETERMINATION AND GROUND FLYING ON A FULL-SCALE HELICOPTER Final Report, May 1977 - Dec. 1980
R. Jones, W. G. Fennelly, E. J. Nagy, and J. A. Fabunmi May 1981 164 p refs
(Contract DAAJ02-77-C-0027; DA Proj. 1L2-62209-AH-76)
(USAAVRADCOM-TR-81-D-11; R-1625) Avail: NTIS HC A08/MF A01

Force determination is a method of obtaining dynamic loads acting on a vehicle in flight. These loads were determined from measured fuselage responses obtained in flight and calibration matrices obtained in a shake test. These forces obtained were verified by ground flying in a hangar and duplicated the responses obtained in flight. Author

A PIECEWISE LINEAR STATE VARIABLE TECHNIQUE FOR REAL TIME PROPULSION SYSTEM SIMULATION
James R. Mihaloew and Stephen P. Roth (Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) 1982 16 p refs Presented at the 13th Ann. Pittsburgh Conf. on Modelling and Simulation, Pittsburgh, 22-23 Apr. 1982; sponsored by IEEE, ISA, SCS and SMCS
(NASA-TM-82851; E-1210; NAS 1.15:82851) Avail: NTIS HC A02/MF A01 CSCL 21E

The emphasis on increased aircraft and propulsion control system integration and piloted simulation has created a need for higher fidelity real time dynamic propulsion models. A real time propulsion system modeling technique which satisfies this need and which provides the capabilities needed to evaluate propulsion system performance and aircraft system interaction brake hydraulic system concept is feasible, and the basic operation, control characteristics and stability of the brake system are not affected by the two-fluid configuration. The increased density of the CTFE fluid does not cause the hydraulic system to respond slower resulting in longer aircraft stopping distances. However, analysis indicates that the performance lost by changing to the CTFE fluid can be regained by increasing brake hydraulic line sizes and returning the antiskid control box. Author (GRA)

IMPROVEMENT PROGRAM FOR THE C-141 NAVIGATION SELECTOR PANEL Final Engineering Report
Henry L. Riser, Jr. Jan. 1982 20 p
(Grant F09603-80-G-3338-0012)
(AD-A111469; Rept-2315-11-1-2635) Avail: NTIS HC A02/MF A01 CSCL 01/4

This report presents the results of an engineering study to improve the reliability and maintainability of the Navigation Selector Panel, Part Number 75-89181, NSN 6605-01-038-6849JH, used in all models of the C-141 aircraft. The work described in this document was performed for the U. S. Air Force and specifically for the Reliability Engineering Branch, Item Management Division, MMIRCA-4, of Robins Air Force Base, Georgia, 31098. Maintenance data covering one year were obtained and analyzed. The items most often replaced were the lighted push-button switches in the assembly caused by poor switch design. Changes were recommended. Author (GRA)

STGSTK: A COMPUTER CODE FOR PREDICTING MULTISTAGE AXIAL FLOW COMPRESSOR PERFORMANCE BY A MEANLINE STAGE STACKING METHOD
Ronald J. Steinke May 1982 65 p refs
(NASA-TP-2020; E-551; NAS 1.60:2020) Avail: NTIS HC A04/MF A01 CSCL 21E

A FORTRAN computer code is presented for off-design performance prediction of axial-flow compressors. Stage and compressor performance is obtained by a stage-stacking method that uses representative velocity diagrams at rotor inlet and outlet meanline radii. The code has options for: (1) direct user input or calculation of nondimensional stage characteristics; (2) adjustment of stage characteristics for off-design speed and blade setting angle; (3) adjustment of rotor deviation angle for off-design conditions; and (4) SI or U.S. customary units. Correlations from experimental data are used to model real flow conditions. Calculations are compared with experimental data. Author

THREE DIMENSIONAL MEAN VELOCITY AND TURBULENCE CHARACTERISTICS IN THE ANNULUS WALL REGION OF AN AXIAL FLOW COMPRESSOR ROTOR PASSAGE
R. Davino and B. Lakshminarayana May 1982 262 p refs
(Grant NsG-3212)
(NASA-CR-169003; NAS 1.26:169003; PSU/TURBO-82-2) Avail: NTIS HC A12/MF A01 CSCL 21E

The experiment was performed using the rotating hot-wire technique within the rotor blade passage and the stationary hot-wire technique for the exitflow of the rotor blade passage. The measurements reveal the effect of rotation and subsequent flow interactions upon the rotor blade flowfield and wake development in the annulus-wall region. The flow near the rotor blade tips is found to be highly complex due to the interaction of the annulus-wall boundary layer, the blade boundary layers, the tip leakage flow, and the secondary flow. Within the blade passage, this interaction results in an appreciable radial inward flow as well as a defect in the mainstream velocity near the mid-passage. Turbulence levels within this region are very high. This indicates a considerable extent of flow mixing due to the viscous flow interactions. The size and strength of this loss core is found to grow with axial distance from the blade trailing edge. The nature of the rotor blade exit-flow was dominated by the wake development. T.M.

INVESTIGATION OF THE TIP CLEARANCE FLOW INSIDE AND AT THE EXIT OF A COMPRESSOR ROTOR PASSAGE
A. Pandya and B. Lakshminarayana May 1982 147 p refs
(Grant NsG-3212)
(NASA-CR-169004; NAS 1.26:169004; PSU/TURBO-82-3) Avail: NTIS HC A07/MF A01 CSCL 21E

The nature of the tip clearance flow in a moderately loaded compressor rotor is studied. The measurements were taken inside the clearance between the annulus-wall casing and the rotor blade tip. These measurements were obtained using a stationary two-sensor hot-wire probe in combination with an ensemble averaging technique. The flowfield was surveyed at various radial locations and at ten axial locations, four of which were inside the blade passage in the clearance region and the remaining six outside the passage. Variations of the mean flow properties in the tangential and the radial directions at various axial locations were derived from the data. Variation of the leakage velocity at different axial stations and the annulus-wall boundary layer profiles from passage-averaged mean velocities were also estimated. B.W.

COST/BENEFIT STUDIES OF ADVANCED MATERIALS TECHNOLOGIES FOR FUTURE AIRCRAFT TURBINE ENGINES: MATERIALS FOR ADVANCED TURBINE ENGINES
M. Stearns and L. Wilbers May 1982 49 p
(Contract NAS3-20074)
(NASA-CR-167849; NAS 1.26:167849) Avail: NTIS HC A03/MF A01 CSCL 21E

Cost benefit studies were conducted on six advanced materials and processes technologies applicable to commercial engines planned for production in the 1985 to 1990 time frame. These technologies consisted of thermal barrier coatings for combustor and high pressure turbine airfoils, directionally solidified eutectic high pressure turbine blades, (both cast and fabricated), and mixers, tail cones, and piping made of titanium-aluminum alloys. A fabricated titanium fan blisk, an advanced turbine disk alloy with improved low cycle fatigue life, and a long-life high pressure turbine blade abrasive tip and ceramic shroud system were also analyzed. Technologies showing considerable promise as to benefits, low development costs, and high probability of success were thermal barrier coating, directionally solidified eutectic turbine blades, and abrasive-tip blades/ceramic-shroud turbine systems. R.J.F.

EXHAUST EMISSIONS SURVEY OF A TURBOFAN ENGINE FOR FLAME HOLDER SWIRL TYPE AUGMENTORS AT SIMULATED ALTITUDE FLIGHT CONDITIONS
John E. Moss, Jr. Oct. 1981 47 p refs

(NASA-TM-82787; E-955; NAS 1.15:82787) Avail: NTIS HC A03/MF A01 CSCL 21E

Emissions of carbon dioxide, total oxides of nitrogen, unburned hydrocarbons, and carbon monoxide from an F100 afterburning two spool turbofan engine at simulated flight conditions are reported. Tests were run at Mach 0.8 at altitudes of 10.97 and 13.71 km (36,000 and 45,000 ft), and at Mach 1.2 at 13.71 km (45,000 ft). Emission measurements were made from intermediate power (nonafterburning) through maximum afterburning, using a single point gas sample probe traversed across the horizontal diameter of the exhaust nozzle. The data show that emissions vary with flight speed, altitude, power level, and radial position across the nozzle. Carbon monoxide emissions were low for intermediate and partial afterburning power. Unburned hydrocarbons were near zero for most of the simulated flight conditions. At maximum afterburning, there were regions of NOx deficiency in regions of high CO. The results suggest that the low NOx levels observed in the tests are a result of interaction with high CO in the thermal converter. CO2 emissions were proportional to local fuel air ratio for all test conditions.

DEVELOPMENT OF AN ANALYTICAL TECHNIQUE FOR THE OPTIMIZATION OF JET ENGINE AND DUCT ACOUSTIC LINERS Final Technical Report, 1 Mar. 1981 - 28 Feb. 1982
Ben T. Zinn and William L. Meyer 28 Feb. 1982 159 p refs
(Grant NAG1-133)
(NASA-CR-169002; NAS 1.26:169002) Avail: NTIS HC A08/MF A01 CSCL 21E

A new method was developed for the calculation of optimum constant admittance solutions for the minimization of the sound radiated from an arbitrary axisymmetric body. This method utilizes both the integral equation technique used in the calculation of the optimum non-constant admittance liners and the independent solution generated as a by product of these calculations. The results generated by both these methods are presented for three duct geometries: (1) a straight duct; (2) the QCSEE inlet; and (3) the QCSEE inlet less its centerbody.

FRACTURE MECHANICS CRITERIA FOR TURBINE ENGINE HOT SECTION COMPONENTS Final Report
G. J. Meyers May 1982 123 p refs
(Contract NAS3-22550)
(NASA-CR-167896; NAS 1.26:167896; PWA-5772-23) Avail: NTIS HC A06/MF A01 CSCL 21E

The application of several fracture mechanics data correlation parameters to predicting the crack propagation life of turbine engine hot section components was evaluated. An engine survey was conducted to determine the locations where conventional fracture mechanics approaches may not be adequate to characterize cracking behavior. Both linear and nonlinear fracture mechanics analyses of a cracked annular combustor liner configuration were performed. Isothermal and variable temperature crack propagation tests were performed on Hastelloy X combustor liner material. The crack growth data was reduced using the stress intensity factor, the strain intensity factor, the J integral, crack opening displacement, and Tomkins' model. The parameter which showed the most effectiveness in correlation high temperature and variable temperature Hastelloy X crack growth data was crack opening displacement.

NEW DEVELOPMENTS IN THE FIELD OF RAMJET MISSILE PROPULSION [NEUE ENTWICKLUNGEN AUF DEM GEBIET DER FLUGKOERPER-STAUANTRIEBE]
H.-L. Weinreich 12 Nov. 1981 65 p refs In GERMAN
(MBB-UR-516-81-O) Avail: NTIS HC A04/MF A01

Various supersonic ramjets are discussed which were proposed for the propulsion systems of tactical missiles with higher average velocities. Design and general operating characteristics of ramjet engines are reviewed. The interaction between intake system and ramjet combustion chamber performance is treated with reference to throttling schemes. Ramjet engines, using liquid or solid propellant, as well as solid fuel ramrockets are studied. Experimentally proven performance of ramjet designs is cited and technological trends are identified. Development results concern fuel, inlet systems, variable thrust chokes; and ramjet combustion chamber/integral booster configurations.

BARRIERS AND DISPERSAL SURFACES IN MINIMUM-TIME INTERCEPTION
N. Rajan and M. D. Ardema May 1982 34 p refs
(NASA-TM-84241; A-8912; NAS 1.15:84241) Avail: NTIS HC A03/MF A01 CSCL 01C

Minimum time interception of a target moving in a horizontal plane is analyzed as a one-player differential game. Dispersal points and points on the barrier are located for a class of pursuit evasion and interception problems. These points are determined by constructing cross sections of the isochrones and hence obtaining the barrier, dispersal, and control level surfaces. The game solution maps the controls as a function of the state within the capture region.

Calculation of the flow-field velocities of a wing-body-stores combination in transonic flow [AIAA PAPER 82-0958] A82-31934
Closed-form solutions of supersonic wing-body interference A82-33120
Transonic flow past bodies of the type wing-fuselage with allowance for boundary effects A82-34166
Accounting for thickness effects in the calculation of subcritical unsteady aerodynamic forces: Application to wing-fuselage interactions [SNIAS-821-111-106] N82-24183
An analytical procedure for computing smooth transitions between two specified cross sections with applications to blended wing body configuration [NASA-TP-2012] N82-25193
Application of Computational Fluid Dynamics (CFD) in transonic wind-tunnel/flight-test correlation N82-25211
Experimental determination of flow-interference effects of wing-mounted, two-dimensional, full-capture propulsion nacelles in close proximity to a vehicle body at a Mach number of 6 [NASA-TM-83207] N82-25217
The FFA wing body 81 computer program. A panel method for determination of aerodynamic characteristics at subsonic and supersonic speeds [FFA-TN-AU-1601] N82-25230
BOEING AIRCRAFT
Opportunities for wind-tunnel/flight correlation with new Boeing airplanes N82-25206
BOEING 757 AIRCRAFT
Gathering and analysing data on the British Airways Boeing 757 aircraft N82-25186
BONDING
Chem-Braze abradable seal attachment to aircraft gas turbine compressor components [AD-A111692] N82-25521
BOUNDARY LAYER CONTROL
The NASA Langley laminar flow control airfoil experiment [AIAA PAPER 82-0567] A82-33327
Experimental and analytical results of tangential blowing applied to a subsonic V/STOL inlet [NASA-TM-82847] N82-24165
BOUNDARY LAYER SEPARATION
Three-dimensional separation and reattachment [NASA-TM-84221] N82-24167
Comparison of boundary layer calculations for the root section of a wing. The September 1979 Amsterdam Workshop test case [NLR-MP-80028-U] N82-25232
BOUNDARY LAYER STABILITY
Accurate numerical solution of compressible, linear stability equations A82-33571
BOUNDARY VALUE PROBLEMS
Analysis of small-aspect-ratio lifting surfaces in ground effect A82-32223
Nonlinear two-dimensional sail theory [AD-A110450] N82-25220
BRAKING
Tire tread temperatures during antiskid braking and cornering on a dry runway [NASA-TP-2009] N82-24193

C

C-141 AIRCRAFT
Improvement program for the C-141 Navigation Selector Panel [AD-A111469] N82-25248
CANOPIES
Finite-element modeling of a fighter aircraft canopy acrylic panel A82-32848
CARGO AIRCRAFT
The potential of large aircraft [AIAA PAPER 82-0804] A82-31980
Very large aircraft with alternate fuels - LH2 most promising [AIAA PAPER 82-0813] A82-31986
The potential for long-range high-payload aircraft with alternate fuels [AIAA PAPER 82-0814] A82-31987
CARTESIAN COORDINATES
A new method for constructing two-dimensional orthogonal and non-orthogonal meshes A82-33630

CASCADE FLOW
  A high-frequency transonic small disturbance code for unsteady flows in a cascade
  [AIAA PAPER 82-0955] A82-31932
  Mathematical modeling of unsteady separated flow past solid airfoil cascades
  A82-32801
CERAMICS
  Chem-Braze abradable seal attachment to aircraft gas turbine compressor components
  [AD-A111692] N82-25521
CHANNEL FLOW
  Similarity parameters for the geometric structure of a supersonic jet propagating in a channel and in a submerged space
  A82-34132
CHEMICAL CLEANING
  Chem-Braze abradable seal attachment to aircraft gas turbine compressor components
  [AD-A111692] N82-25521
CHROMIUM
  A status review of NASA's COSAM (Conservation Of Strategic Aerospace Materials) program
  [NASA-TM-82852] N82-24326
CHROMIUM ALLOYS
  Formability of INCOLOY alloy MA 956 - An oxide dispersion strengthened sheet alloy
  A82-33994
CIRCUIT BOARDS
  Improvement program for the C-141 Navigation Selector Panel
  [AD-A111469] N82-25248
CIVIL AVIATION
  Beyond 2000 - The airlift challenge ahead
  [AIAA PAPER 82-0815] A82-31900
  Recent developments in aviation cases
  A82-32055
  Aviation accident investigation - Functional and legal perspectives
  A82-32059
  Factors influencing settlement of personal injury and death claims in aircraft accident litigation
  A82-32062
  Principles of efficient energy use at Interflug
  A82-33250
  Essentials of aviation management /2nd edition/ --- Book
  A82-33648
  Solutions to the aviation fuel problem
  A82-34113
  Technical trends in the civil aircraft and helicopter industry
  A82-34120
  Aeronautical information data subsystems --- air navigation
  N82-25178
CLEARANCES
  Investigation of the tip clearance flow inside and at the exit of a compressor rotor passage
  [NASA-CR-169004] N82-25253
CLOUD COVER
  Cloud top remote sensing by airborne lidar
  A82-32920
CLUTTER
  A multifrequency adaptive radar for detection and identification of objects - Results on preliminary experiments on aircraft against a sea-clutter background
  A82-32979
  Doppler processing, waveform design and performance measures for some pulsed Doppler and MTD-radars. II
  A82-34671
COAL DERIVED LIQUIDS
  Low NOx heavy fuel combustor concept program
  [NASA-CR-165367] N82-25635
COBALT
  A status review of NASA's COSAM (Conservation Of Strategic Aerospace Materials) program
  [NASA-TM-82852] N82-24326
COLLISION AVOIDANCE
  Primary sewage treatment plant as a source of bird hazards at airport
  A82-33523
  Proceedings of the 11th symposium on aircraft integrated data systems --- conferences
  [DFVLR-MITT-82-02] N82-25171
  A pilot's view on possible uses of AIDS --- airborne collision avoidance systems
  N82-25176
COLOR CODING
  New techniques in data retrieval and display --- color graphics
  N82-25174
COMBAT
  Military aircraft
  A82-34121
  Simulator for air-to-air combat versus real world: Visual cue analysis for simulated air-to-air combat training
  [AD-A110570] N82-25270
COMBUSTION CHAMBERS
  Experimental study on discharge and loss coefficients of combustor swirlers
  A82-34644
  Nonlinear structural and life analyses of a combustor liner
  [NASA-TM-82846] N82-24501
  Fracture mechanics criteria for turbine engine hot section components
  [NASA-CR-167896] N82-25257
  Coaxial dump Ramjet combustor combustion instabilities. Part 1: Parametric test data
  [AD-A111355] N82-25259
  Low NOx heavy fuel combustor concept program
  [NASA-CR-165367] N82-25635
COMBUSTION PRODUCTS
  Exhaust emissions survey of a turbofan engine for flame holder swirl type augmentors at simulated altitude flight conditions
  [NASA-TM-82787] N82-25255
  Low NOx heavy fuel combustor concept program
  [NASA-CR-165367] N82-25635
COMBUSTION STABILITY
  Coaxial dump Ramjet combustor combustion instabilities. Part 1: Parametric test data
  [AD-A111355] N82-23259
COMMERCIAL AIRCRAFT
  Commercial transport developments for the 1980's
  A82-34109
  Future propulsion opportunities for commuter airplanes
  [NASA-TM-82880] N82-24203
COMMUNICATION NETWORKS
  Outline of a multiple-access communication network based on adaptive arrays
  A82-34607
COMMUNICATION SATELLITES
  Outline of a multiple-access communication network based on adaptive arrays
  A82-34607
COMPOSITE STRUCTURES
  Calculation of the cross section properties and the shear stresses of composite rotor blades
  [MBB-UD-334-81-O] N82-25334
COMPRESSIBLE BOUNDARY LAYER
  Calculations of viscous transonic flow over aerofoils
  [AIAA PAPER 82-0997] A82-31957
  Accurate numerical solution of compressible, linear stability equations
  A82-33571
COMPRESSIBLE FLOW
  A vortex sheet method for calculating separated two-dimensional flows at high Reynolds number
  [AIAA PAPER 82-1030] A82-31978
COMPRESSION TESTS
  Material flow and defect formation in forging an airfoil shape from metal-matrix composites
  A82-33995
COMPRESSOR BLADES
  Aeroelasticy of compressor blades: Subsonic stall flutter
  N82-26189
COMPRESSOR EFFICIENCY
  STGSTK: A computer code for predicting multistage axial flow compressor performance by a meanline stage stacking method
  [NASA-TP-2020] N82-25250
COMPRESSOR ROTORS
  Investigation of the tip clearance flow inside and at the exit of a compressor rotor passage
  [NASA-CR-169004] N82-25253
COMPRESSORS
  Large scale aeroengine compressor test facility
  A82-34953

SUBSONIC FLUTTER
Experiment on active flutter suppression of a cantilever wing
[NAL-TR-690] N82-22282
SUBSONIC SPEED
Fuel efficient and Mach 0.8, too
A82-29774
SUBSONIC WIND TUNNELS
A numerical investigation of two-dimensional, subsonic, linear, wind tunnel interference theory
[ARL/AERO-NOTE-403] N82-23197
SUCTION
Crossflow shock on the suction side of a flat delta wing with supersonic leading edges
A82-29659
SUPERCRITICAL WINGS
A wind-tunnel study of the aerodynamic characteristics of a slotted versus smooth-skin supercritical wing
[AIAA 82-0682] A82-30139
Measured and calculated effects of angle of attack on the transonic flutter of a supercritical wing
[AIAA 82-0647] A82-30143
Transonic flutter study of a wind-tunnel model of a supercritical wing with/without winglet
[AIAA 82-0721] A82-30171
Investigation of passive shock wave-boundary layer control for transonic airfoil drag reduction
[NASA-CR-168644] N82-22209
Aeroelastic properties of wings in transonic flow
[NLR-MP-81005-U] N82-22224
Transonic flutter study of a wind-tunnel model of a supercritical wing with/without winglet --- conducted in Langley Transonic Dynamics Tunnel
[NASA-TM-83279] N82-23239
SUPERPLASTICITY
SPF of high strength aluminum structures --- superplastic forming for complex aircraft structures
A82-28997
SUPERSONIC FLOW
Crossflow shock on the suction side of a flat delta wing with supersonic leading edges
A82-29659
Turboprop and turbojet ejector optimisation
N82-23174
SUPERSONIC JET FLOW
Acoustic emission from free jets --- supersonic jets
N82-22962
Experimental study of a jet deflector
N82-23173
SUPERSONIC NOZZLES
Numerical study of vibrational relaxation in the turbulent mixing of jets in a supersonic nozzle
A82-29880
SUPERSONIC SPEEDS
Approximate method for predicting supersonic normal force coefficient very-low-aspect-ratio lifting surfaces
[AD-A111770] N82-23199
SUPPORT SYSTEMS
Metric half-span model support system
[NASA-CASE-LAR-12441-1] N82-23254
SURFACE DEFECTS
Integrity analyses of surface-flawed aircraft attachment lugs - A new, inexpensive, 3-D alternating method
[AIAA 82-0742] A82-30107
SURFACE FINISHING
Structural integrity of an adhesively bonded aircraft fuselage
A82-28996
SURGES
Encounters with surge: Some experiences of development of axial compressors for aero gas turbines
[PNR-90071] N82-22274
SURVEILLANCE RADAR
Improvements to secondary radar for air traffic control
A82-30311
The reliability of height and identity data --- secondary surveillance radar error analysis
A82-30312
SURVIVAL
Commercial jet transport crashworthiness
[NASA-CR-165849] N82-23207
SUSPENDING (HANGING)
Elastic suspension of a wind tunnel test section
N82-22361
SWEPT FORWARD WINGS
Flutter of forward swept wings, analyses and tests
[AIAA 82-0646] A82-30142
Rigid body-structural mode coupling on a forward swept wing aircraft
[AIAA 82-0683] A82-30150
Active control of aeroelastic divergence
[AIAA 82-0684] A82-30151
SWEPTBACK WINGS
Helicopter rotor performance improvement by utilization of swept-back parabolic blade tip --- wind tunnel tests
N82-22151
Aerodynamic performance of slender wings with separated flows
[NASA-CR-168768] N82-22206
Aeroelastic properties of wings in transonic flow
[NLR-MP-81005-U] N82-22224
SWIRLING
The effect of swirl burner aerodynamics on NOx formation
A82-28650
SYSTEM EFFECTIVENESS
Estimation of the performance of nonstationary discontinuous control systems for flight vehicles
A82-29832
SYSTEMS ENGINEERING
Applications of system identification methods to the prediction of helicopter stability, control and handling characteristics
N82-23230
SYSTEMS INTEGRATION
The integration of multiple avionic sensors and technologies for future military helicopters
N82-23186

T

T-38 AIRCRAFT
Finite element analysis of through the canopy emergency crew escape from the T-38 aircraft
[AIAA 82-0705] A82-30096
TACTICS
Review of practical experience on combat aircraft manoeuvrability
N82-22189
TACTILE DISCRIMINATION
A tactual display aid for primary flight training
[NASA-CR-166282] N82-22238
TAIL ASSEMBLIES
Tail configurations for highly maneuverable combat aircraft
N82-22201
Concept studies of an advanced composite helicopter fin
[SNIAS-821-210-106] N82-22257
TAILLESS AIRCRAFT
Tail configurations for highly maneuverable combat aircraft
N82-22201
TAKEOFF
Analysis and Monte Carlo simulation of near-terminal aircraft flight paths
[NASA-TP-1997] N82-23233
TANKS (COMBAT VEHICLES)
A light helicopter for night firing
[SNIAS-821-210-105] N82-22256
TAPE RECORDERS
A portable, low-cost flight-data measurement and recording system
[NASA-TM-84229] N82-22478
TARGET ACQUISITION
The structural dynamic interface required for developing helicopter target acquisition systems
N82-22165
TARGET RECOGNITION
A light helicopter for night firing
[SNIAS-821-210-105] N82-22256
TAXIING
Effects of cable geometry and aircraft attitude on the accuracy of a magnetic leader cable system for aircraft guidance during rollout and turnoff
[NASA-TP-1978] N82-22239

TECHNOLOGICAL FORECASTING
Developmental possibilities in civil aviation in the Federal Republic of Germany
N82-22230
TECHNOLOGY ASSESSMENT
Fuel efficient and Mach 0.8, too
A82-29779
Effects of cable geometry and aircraft attitude on the accuracy of a magnetic leader cable system for aircraft guidance during rollout and turnoff
[NASA-TP-1970] N82-22139
Conceptual design study of a visual system for a rotorcraft simulator and some advances in platform motion utilization
[NASA-CR-166322] N82-22246
TEMPERATURE DISTRIBUTION
Thermal stability analysis for conical shells with variable parameters
A82-29844
TENSILE STRENGTH
Effects of 50,000 hours of thermal aging on graphite/epoxy and graphite/polyimide composites
[AIAA 82-0657] A82-30087
High temperature, short term tensile strength of C6000/PMR-15 graphite polyimide
[AIAA 82-0711] A82-30125
TENSILE TESTS
Effects of moisture on the mechanical properties of glass/epoxy composites
A82-29936
TENSOR ANALYSIS
Alternatives for jet engine control
[NASA-CR-168894] N82-22267
TERMINAL FACILITIES
Instruments and installations for meteorological measurements at airports --- Russian book
A82-28636
TERRAIN ANALYSIS
Integrated navigation-[illegible]-system based on stored terrain data processing
N82-22183
TERRAIN FOLLOWING AIRCRAFT
Integrated navigation-[illegible]-system based on stored terrain data processing
N82-22183
Optimal inertial navigation using terrain correlation: An attractive solution to the ground attack aircraft navigation problem
N82-22184
TEST CHAMBERS
Acoustic noise test as part of the dynamic qualification program in aerospace
N82-22162
TEST EQUIPMENT
Blockage and flow studies of a generalized test apparatus including various wing configurations in the Langley 7-inch Mach 7 Pilot Tunnel
[NASA-TM-83301] N82-22471
THERMAL CONTROL COATINGS
The contribution of thermal barrier coatings to improvements in the life and performance of gas turbine components
[PNR-90076] N82-22271
THERMAL DEGRADATION
Effects of 50,000 hours of thermal aging on graphite/epoxy and graphite/polyimide composites
[AIAA 82-0657] A82-30087
On the characterization of damage in graphite-epoxy composites
[AIAA 82-0757] A82-30177
THERMAL SHIELDING
A light helicopter for night flying
[SNIAS-821-210-105] N82-22256
THERMAL RESISTANCE
Test methodology for evaluation of fireworthy aircraft seat cushions
A82-29396
THERMAL STABILITY
Thermal stability analysis for conical shells with variable parameters
A82-29844
Composite heads improve thermal integrity
A82-30006
THERMOMECHANICAL TREATMENT
SPF of high strength aluminum structures --- superplastic forming for complex aircraft structures
A82-29993

[illegible]
Analysis of shells of [illegible]
A82-[illegible]
THIN WALLED SHELLS
Thermal stability analysis for conical shells with variable parameters
A82-29844
THIN WALLS
Experimental stress analysis of a thin-walled pressurized torus loaded by contact with a plane --- dynamic response of aircraft tires
[AIAA 82-0783] A82-30178
THREE DIMENSIONAL FLOW
Application of computer generated color graphic techniques to the processing and display of three dimensional fluid dynamic data --- for turbine blade [illegible] pressure analysis
A82-[illegible]
Comparison between computations and experimental data in unsteady three-dimensional transonic aerodynamics, including aeroelastic applications
[AIAA 82-0690] A82-30107
THRUST AUGMENTATION
Thrust augmenting ejectors: A review of the application of jet mechanics to V/STOL aircraft propulsion
A82-[illegible]
Improvement of ejector thrust augmentation by pulsating or flapping jets
N82-22173
THRUST VECTOR CONTROL
Wind-tunnel investigation of the forward low-speed longitudinal aerodynamics of the Vectored-Engine-Over (VEO) wing fighter configuration
[NASA-TM-83268] N82-22207
THUNDERSTORMS
The 1981 direct strike lightning data --- utilizing the F-106 aircraft
[NASA-TM-83273] N82-22940
TILT ROTOR RESEARCH AIRCRAFT PROGRAM
NASA/Army Advanced Rotorcraft Technology and Tilt Rotor Workshop. Volume 7: Tilt Rotor Session
[NASA-TM-84785] N82-22248
TILTING ROTORS
Aeroacoustic survey of wind tunnel testing of small and large scale rotors
[SNIAS-821-210-107] N82-22228
TIME MARCHING
Time-marching transonic flutter solutions including angle-of-attack effects
[NASA-TM-83295] N82-22186
TIME OPTIMAL CONTROL
Comment on 'Optimal control via mathematical programming'
A82-29929
TIME RESPONSE
Transonic time-response analysis of three D.O.F. conventional and supercritical airfoils
[AIAA 82-0688] A82-30108
TITANIUM ALLOYS
Advanced aluminum and titanium structures; Proceedings of the Winter Annual Meeting, Washington, DC, November 15-20, 1981
A82-29990
Development of low-cost aluminum structures using blended elemental powder metallurgy
A82-29996
Review of aeronautical fatigue investigations in the Netherlands, March 1979 - February 1981
[NLR-MP-81008-U] N82-22441
Powder metallurgical innovations for improved hot section alloys in aero-engine applications
[PNR-90072] N82-22270
TOUGHNESS
Tailor-made structures: today and tomorrow. New materials, an exploratory investigation into their potential use --- in aircraft
[BAE-[illegible]] N82-22231
[illegible]
Shape optimization of fiber reinforced composites
[AIAA 82-0719] A82-30132
TOROIDS
Experimental stress analysis of a thin-walled pressurized torus loaded by contact with a plane --- dynamic response of aircraft tires
[AIAA 82-0783] A82-30178

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

A82-33387 † **Aerodynamics. Part 2 - Methods of aerodynamic design /3rd revised and enlarged edition/ (Aerodinamika. Part 2 - Metody aerodinamicheskogo rascheta /3rd revised and enlarged edition/).** N. F. Krasnov. Moscow, Izdatel'stvo Vysshaia Shkola, 1980. 416 p. 53 refs. In Russian.

Methods for determining the aerodynamic characteristics of aircraft and aircraft components are discussed. Analysis is carried out for supersonic flow around pointed and blunt conical surfaces and thin-walled bodies of revolution at small angles of attack (linearized problems). Methods for calculating friction and heat transfer are examined. Attention is also given to the determination of aerodynamic parameters of aircraft for the combinations fuselage-wing and fuselage-wing-empennage (control surfaces) with allowance for interference effects. Finally, the aerodynamics of rarified gases is discussed. V.L.

A82-33514 # **Downwash behind a wing with spanwise blowing.** P. R. Kumar and E. G. Tulapurkara (Indian Institute of Technology, Madras, India). *Aeronautical Society of India, Journal*, vol. 32, Feb.-Nov. 1980, p. 105-108. 7 refs.

A theoretical estimate of downwash using Campbell's (1975) data on lift distributions on trapezoidal wings is presented. An indirect method is used to obtain circulation distributions, which are worked out for different values of the blowing coefficient using the vortex lattice method of Hedman (1966). Downwash behind the wing increases rapidly with increase in the blowing coefficient, and a value for the blowing coefficient is found for which the tail contribution to stability will be zero. Thus, the wing contribution to stability increases with blowing and the net decrease in stability is lower. D.L.G.

A82-33515 # **Finite element analysis of some aerospace shell structures.** S. Viswanath, S. S. Murthy, and C. G. Shah (National Aeronautical Laboratory, Bangalore, India). *Aeronautical Society of India, Journal*, vol. 32, Feb.-Nov. 1980, p. 109-115. 9 refs.

A computer program LINSHL is developed for the linear static analysis of stiffened shell structures. The program incorporates a high precision triangular cylindrical shell element, a high precision triangular shallow shell element, a curved beam element and a straight beam element. Numerical results are presented for the stress analysis of practical structures such as a ring-stiffened cylinder and a canopy hood of a typical aircraft, and are found to be in reasonable agreement with alternate solution methods. D.L.G.

A82-33520 # **Design, fabrication and testing of an electrical analogue for heat transfer to coated turbine blade.** P. R. Joshi and W. V. Nabar (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal*, vol. 32, Feb.-Nov. 1980, p. 133-136.

The analog method is described for the study of heat transfer to a coated solid turbine blade. The method is based on the fact that the governing equations for heat conduction in an isotropic, homogeneous nonheat- generating body under steady state conditions are the same as those governing the steady state distribution of electrical potential. The analog can be used to obtain the temperature distribution over the cross section of different blades coated or otherwise for various operating conditions. A schematic diagram of the electrical analog for heat transfer to a coated turbine blade is presented, and the design and fabrication of the analog is discussed. D.L.G.

A82-33523 # **Primary sewage treatment plant as a source of bird hazards at airport.** S. C. Pillai, M. K. C. Sridhar, and G. K. Viswanath (CIERS Research and Consultancy Private, Ltd., Bangalore, India). *Aeronautical Society of India, Journal*, vol. 32, Feb.-Nov. 1980, p. 149-153. 8 refs.

A82-33542 **From the A 300 to the A 310 (De l'A 300 à l'A 310).** R. Deque and D. Puyplat (Société Nationale Industrielle Aérospatiale, Division Avions, Paris, France). *L'Aéronautique et l'Astronautique*, no. 93, 1982, p. 3-18. In French.

The subcontractor assignments and the evolutionary changes which produced the A 310 from the A 300 Airbus are described. Each subcontractor delivered parts in a maximal state of integration to the final assembly plant, which is intended to produce 8-10 aircraft/mo. The results of numerical modeling of the aerodynamic performance of the A 300 in subsonic/supersonic shock configurations led to a thickening of the wing near the root, in addition to a 16 percent reduction in total wing area, a 14 percent increase in wing length to reduce drag, and a higher cruising altitude. Composite materials were employed for the spoilers, airbrakes, the rudder, motor nacelles, etc., along with new, lightweight aluminum-zinc alloys for the longerons. Controls have been computerized and CRTs are in place in the cockpit instrument panel. Details of the instrumentation displays are provided. M.S.K.

A82-33543 **The beginning of the ATR 42 program and its importance (Le lancement du programme ATR 42 et ses conséquences).** A. Etesse (Société Nationale Industrielle Aérospatiale, Division Avions, Paris, France). *L'Aéronautique et l'Astronautique*, no. 93, 1982, p. 19-22. In French.

Marketing and flight economy goals have led to the development of the ATR 42-100 and 42-200 dual turboprop aircraft for carrying 42 or 49 passengers 1300 or 1450 km, respectively. An increase in comuter air traffic of 20-30 percent every year in France and 12 percent in the U.S. are cited as the driving force for the development of the new aircraft. The physical capabilities of the ATR are 15 tons weight, a flying range of 1350 km with 42 passengers, a cruise speed of 513 km/hr, an altitude of 13,400 ft on one motor, and a runway requirement of 900 m. The aircraft is a joint effort of the French and Italian governments, following an accord signed in 1980 to establish a common carrier. A P.W. 100/2 will initially power the plane until 1985, when a motor which allows the passenger number to increase to 50-60 will be introduced. M.S.K.

A82-33544 **Aircraft lightning protection (Protection des aéronefs contre la foudre).** J. Taillet (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *L'Aéronautique et l'Astronautique*, no. 93, 1982, p. 37-52. 40 refs. In French.

Currently known effects of lightning on aircraft and interior components are reviewed, along with measures which must be taken in order to make the broad use of composites acceptable in future aircraft. The types of accident lightning strikes have inflicted on USAF aircraft in the period 1970-1980 are examined, noting that catastrophic failures occurred due to damage to the control and navigation systems, electronics, and explosions of fuel or armaments. The introduction of increasing amounts of composite materials in the aircraft structures, parts which may cause resistance to the lightning path, and the use of electronic controls which can be degraded by electromagnetic pulses pose difficulties when the introduction of cost-saving measures is also life-endangering. The points of lightning attachment are examined, along with the effects on the aircraft components. It is recommended that composite parts be covered with a thin metallic film which conducts the current freely away from the composite, and that microelectronic circuitry be hardened against EMP. M.S.K.

A82-33547 **Simulation reaches towards reality.** D. Boyle. *Interavia*, vol. 37, May 1982, p. 451-453.

It is noted that the greatest progress is being made in the area of visual simulation, offering the possibility of considerable savings to airlines. The microcircuit has made it possible to develop computer-generated imagery (CGI) systems. A single simulator can provide a tremendous variety of airfield representations. Once the software has been developed for a given location, it can be furnished to many simulators by simply copying a tape or disk recording. A description is given of daylight CGI. C.R.

A82-33571 * **Accurate numerical solution of compressible, linear stability equations.** M. R. Malik (High Technology Corp., Hampton, VA), S. Chuang (George Washington University, Hampton, VA), and M. Y. Hussaini (Institute for Computer Applications in Science and Engineering, Hampton, VA). *Zeitschrift für angewandte Mathematik und Physik*, vol. 33, Mar. 1982, p. 189-201. 12 refs. Contracts No. NAS1-16572; No. NAS1-14472; No. NAS1-15810; Grant No. NCC1-14.

The present investigation is concerned with a fourth order accurate finite difference method and its application to the study of the temporal and spatial stability of the three-dimensional compressible boundary layer flow on a swept wing. This method belongs to the class of compact two-point difference schemes discussed by White (1974) and Keller (1974). The method was apparently first used for solving the two-dimensional boundary layer equations. Attention is given to the governing equations, the solution technique, and the search for eigenvalues. A general purpose subroutine is employed for solving a block tridiagonal system of equations. The computer time can be reduced significantly by exploiting the special structure of two matrices. G.R.

A82-33605 * **Diffraction by a finite strip.** M. H. Williams (Purdue University, West Lafayette, IN). *Quarterly Journal of Mechanics and Applied Mathematics*, vol. 35, Feb. 1982, p. 103-124. 7 refs. Grant No. NsG-3292.

A new approach is presented to diffraction problems involving plane strip barriers or slit apertures. These are problems that display the effects of multiple interacting edges. The approach taken here provides exact, compact solutions. The theory is introduced through a series of examples that are, in fact, the 'standard' problems of the subject, diffraction of a plane oblique wave by a slit, for example. In each case, the solutions are found to depend explicitly on a single 'special' function and its Fourier transform. These fundamental functions are described, with the emphasis placed on practical computational methods. The example problems are all couched in the language of acoustics. C.R.

A82-33625 **Understanding aircraft structures.** J. Cutler. London, Granada Publishing, Ltd., 1981. 176 p. 11 refs. $22.75.

After a brief account of the development history of aircraft structures from wire-braced systems to present semi-monocoque designs, attention is given to the terminology connected with flight, such as the pitch, yaw and roll axes, control, high lift devices, and aircraft shape and dimensions. An account is then given of the nature and calculation of the loads to which aircraft are subjected by maneuvering and payload, and of the most common structural means that have been devised for the bearing of such loads. The design of wing boxes, fuselage tubes, and secondary structures is shown to be a decision process which entails the choosing of sheet, plate, forged or extruded forms of aluminum and titanium alloys, or reinforced plastics. Consideration must then be given to the processes by which the materials chosen will be assembled, along with the means of preventing corrosion of the resulting structure. Additional factors include the detailed design of structural components and fasteners, from the viewpoints of both weight-saving and cost-reduction criteria. Stress calculation methods and flightworthiness requirements are also covered. O.C.

A82-33626 # **Wind tunnel studies of store separation with load factor - Freedrops and captive trajectories.** J. Coste and J. Leynaert (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), Jan.-Feb. 1982, p. 1-9.

Similitude conditions are considered for free-fall and captive trajectory store separation studies in wind tunnels, for the general case of in-flight separation with load factor. Three scaling laws, designated light, intermediate and heavy in keeping with test Mach number, were used in the store separation tests. Attention is given to the computer-controlled, six-degree-of-freedom rig which moves the store model incrementally in the aerodynamic field of the parent aircraft, taking into account the aerodynamic forces acting on the store at each point of its trajectory. Special arrangements are used to compensate for the fact that the method is only approximate, in that it does not take into account the relative speeds of store and aircraft. O.C.

A82-33627 # **Model based study of various configurations of jet crossing a cavity - Application to the CEPRA 19 wind tunnel of CEPr.** P. Rebuffet and A. Guédel (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), Jan.-Feb. 1982, p. 11-22. 8 refs.

A scale model study is conducted to determine the effects of varying the configuration of the crossing of an anechoic wind tunnel test chamber by a free jet, where the length of the jet and the dimensions of the diffuser inlet are varied. Attention is given to cavity resonances due to aeroacoustic coupling which were observed in some model configurations, as well as background noise measurements and the aerodynamic characteristics of both the jet and the reverse flow within the cavity. A collector compatible with 2-3 m diameter test sections is defined with a view to application to a new wind tunnel test facility. O.C.

A82-33628 # **Potentiality assessment of a parallel structure for the solution of partial differential equations.** J. P. Boisseau, M. Enselme, D. Guiraud, and P. Leca (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), Jan.-Feb. 1982, p. 31-41. 9 refs.

An assessment is presented of the efficiency of a parallel-structure minicomputer system consisting of an AP 120 B array processor linked to a 32-bit SEL 32/77 host computer, using software representative of the intended applications: (1) the pseudo-unsteady method, for two- and three-dimensional flow computation; and (2) the pseudo-spectral time method, for the numerical simulation of turbulence. The analysis of test results distinguishes between processing time using the array processor, and transfer time between the memory and the computer unit. A possible compatibility between the hardware and the software algorithm used is investigated in the overlapping of the two characteristic times distinguished. O.C.

A82-33629 # **Skin friction lines.** R. Legendre (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), Jan.-Feb. 1982, p. 43, 44.

The conditions of rapid variation for properties of a viscous fluid flowing around a body are discussed, in order to determine whether the hypothesis of continuity is always justified either alone or in combination with Lighthill's (1963) additional hypothesis. The method employed uses singular points and lines which either pass through, originate or terminate at them. O.C.

A82-33630 # **A new method for constructing two-dimensional orthogonal and non-orthogonal meshes.** H. Viviand (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), Jan.-Feb. 1982, p. 45-49.

A novel and simple method is described for the construction of arbitrary domain orthogonal or nonorthogonal two-dimensional meshes, in which the integration of an ordinary differential equation directly yields mesh point Cartesian coordinates. Nozzle and airfoil profile flow examples are considered. O.C.

A82-33646 **Aviation electronics /4th edition/.** K. W. Bose. Indianapolis, IN, Howard W. Sams and Co., Inc., 1981. 396 p. $17.

Standard communication, navigation, and air traffic control systems are considered along with the aviation radio spectrum, and aircraft communication systems, taking into account rules for flight operations, the structure of the airways, terminal facilities, en-route facilities, aspects of collision avoidance, radio waves and their effect at aviation frequencies, very-low frequencies, the low and medium aviation frequencies, the HF aviation bands, the VHF aviation bands, the UHF bands, aircraft antenna requirements, cockpit audio requirements, microphones and headsets, and transceivers. Other topics discussed are related to the VHF omnirange, navigation systems, instrument landing systems, automatic direction finders, distance-measuring equipment, radar beacon transponders, and weather radar. Attention is also given to gyroscopes and servo systems, flight directors and flight simulators, autopilots, design and reliability of solid-state avionic systems, shop facilities and regulations, and aircraft installations. G.R.

A82-33648 **Essentials of aviation management /2nd edition/.** J. D. Richardson (Appalachian State University, Boone, NC). Dubuque, IA, Kendall-/Hunt Publishing Co., 1981. 589 p. 211 refs. $10.95.

This book is intended to focus on the management of aviation businesses and to provide assistance to managers as they strive to overcome the problems of a rapidly changing and complex business environment. The contents of this book represent a mixture of generally accepted business procedures, practical 'how-to-do-it' material, applied research findings, sophisticated 'tools' and techniques as well as accepted history. A brief review is provided of aviation history and its impact upon the modern manager. Attention is given to management functions, profit orientation, business organization, regulatory impact, manpower management, physical facilities, operational activities, flight operations, aviation maintenance, marketing, problem administration, information systems, aspects of decision making, and the future for aviation business. G.R.

A82-33650 **Gas turbine aero-thermodynamics with special reference to aircraft propulsion.** F. Whittle. Oxford, Pergamon Press, 1981. 273 p. $17.50.

The fundamental principles and developments in aerothermodynamic theory and applications in aircraft propulsion gas turbine systems are detailed. Specific attention is given to the concepts of entropy and the isentropic expansion of a perfect gas. An analysis of the flux density and radial equilibrium in whirling isentropic compressible flows are presented, along with techniques for modeling shock waves in air, isentropic flow through nozzles, and the thermal cycles of perfect gases. Approximate methods for calculating gas turbine cycles are explored, as are the mass flow rate in gas turbines, the part load performance of gas generators, and combustion. Consideration is also given to turbojets, calculations of maximum efficiency, thrust boosting, turbofans, the effect of height and speed on performance, and to a numerical model of a super-thrust engine. M.S.K.

A82-33657 * **Airborne lidar measurements of the Soufriere eruption of 17 April 1979.** W. H. Fuller, Jr., S. Sokol (NASA, Langley Research Center, Hampton, VA), and W. H. Hunt (Wyle Laboratories, Hampton, VA). *Science*, vol. 216, June 4, 1982, p. 1113-1115. 6 refs.

At the time of the Soufriere, St. Vincent, volcanic eruption of April 17, 1979, a NASA P-3 aircraft with an uplooking lidar (light detection and ranging) system onboard was airborne 130 kilometers east of the island. Lidar measurements of the fresh volcanic ash were made approximately 2 hours after the eruption, 120 kilometers to the northeast and east. On the evening of April 18, the airborne lidar, on a southerly flight track, detected significant amounts of stratospheric material in layers at 16, 17, 18, and 19.5 kilometers. These data, and measurements to the north on April 19, indicate that the volcanic plume penetrated the stratosphere to an altitude of about 20 kilometers and moved south during the first 48 hours after the eruption. (Author)

A82-33671 **Aerodynamics: The science of air in motion /2nd edition/.** J. E. Allen (British Aerospace Public, Ltd., Co., Kingston-upon-Thames, Surrey, England). New York, McGraw-Hill Boon Co.; London, Granada Publishing, Ltd., 1982. 212 p. 48 refs. $25.

An anthology of aerodynamic concepts, theory, models of natural phenomena, and applications is presented. The development of aerodynamics visualizations and theory is traced from Newton's work on air resistance in 1726 to space flight and MHD modelling. The behavior of air in motion is examined, with consideration to various aspects of boundary layers, circulation, vortex flow, vorticity, and eddies. Main concepts employed in aerodynamic theory and experiments are listed, including physical constants and aerodynamic quantities such as the Reynolds number, Prandtl number, etc. Attention is given to natural phenomena such as wind flows, tornados, convective motion, and other meteorological occurrences, and the effects of terrain on the movements of the atmosphere. The extension of aerodynamic principles to the design of wind turbines and to aeronautics is explored and carried on to describe celestial objects and their behavior. M.S.K.

A82-33701 **Biennial Wind Energy Conference and Workshop, 5th, Washington, DC, October 5-7, 1981, Proceedings.** *ASME, Transactions, Journal of Solar Energy Engineering*, vol. 104, May 1982. 74 p. (For individual items see A82-33702 to A82-33712)

The results of studies funded by the Federal government to advance the state on manned flight simulators was developed and demonstrated using flight simulator facilities at NASA Ames. A piecewise linear state variable technique is used. This technique provides the system accuracy, stability and transient response required for integrated aircraft and propulsion control system studies. The real time dynamic model includes the detail and flexibility required for the evaluation of critical control parameters and propulsion component limits over a limited flight envelope. The model contains approximately 7.0 K bytes of in-line computational code and 14.7 K of block data. It has an 8.9 ms cycle time on a Xerox Sigma 9 computer. A Pegasus-Harrier propulsion system was used as a baseline for developing the mathematical modeling and simulation technique. A hydromechanical and water injection control system was also simulated. The model was programmed for interfacing with a Harrier aircraft simulation at NASA Ames. Descriptions of the real time methodology and model capabilities are presented. Author

STUDY OF ADVANCED PROPULSION SYSTEMS FOR SMALL TRANSPORT AIRCRAFT TECHNOLOGY (STAT) PROGRAM Final Report

C. F. Baerst, R. W. Heldenbrand, and J. H. Rowse Mar. 1981 119 p refs

(Contract NAS3-21997)

(NASA-CR-165610; NAS 1.26:165610; Garrett-21-3911) Avail: NTIS HC A06/MF A01 CSCL 21E

Definitions of takeoff gross weight, performance, and direct operating cost for both a 30 and 50 passenger airplane were established. The results indicate that a potential direct operating cost benefit, resulting from advanced technologies, of approximately 20 percent would be achieved for the 1990 engines. Of the numerous design features that were evaluated, only maintenance-related items contributed to a significant decrease in direct operating cost. Recommendations are made to continue research and technology programs for advanced component and engine develoment. T.M.

FUTURE PROPULSION OPPORTUNITIES FOR COMMUTER AIRPLANES

William C. Strack Washington 1982 24 p refs Presented at the Commuter Airlines Meeting, Savannah, 24-26 May 1982; sponsored by the Society of Automotive Engineers

(NASA-TM-82880; E-1256; NAS 1.15:82880) Avail: NTIS HC A02/MF A01 CSCL 21E

Commuter airplane propulsion opportunities are summarized. Consideration is given to advanced technology conventional turboprop engines, advanced propellers, and several unconventional alternatives: regenerative turboprops, rotaries, and diesels. Advanced versions of conventional turboprops (including propellers) offer 15-20 percent savings in fuel and 10-15 percent in DOC compared to the new crop of 1500-2000 SHP engines currently in development. Unconventional engines could boost the fuel savings to 30-40 percent. The conclusion is that several important opportunities exist and, therefore, powerplant technology need not plateau. Author

EVALUATION OF CAST TITANIUM ALLOY COMPRESSOR COMPONENTS, VOLUME 1 Final Report, May 1976 - Aug. 1978

Alvin N. Hammer St. Louis, Mo. Army Aviation Research and Development Command Nov. 1981 84 p 2 Vol.

(Contract DAAG46-76-C-0042)

(AD-A111431; RDR-1827-18-Vol-1;
USAAVRADCOM-TR-80-F-10-VOL-1;
AMMRC-TR-81-56-VOL-1) Avail: NTIS HC A05/MF A01 CSCL 21/5

The objective of this program was to characterize the properties of cast titanium alloy compressor impellers to provide a background for design, processing, and qualification for service in the Solar T62T-40 Titan auxiliary power unit and similar small radial gas turbine engines. Four titanium alloy investment casting foundries participated in the production of straight vane test wheels, a low-cost representation of the compressor impellers. As-cast and hot isostatic pressed (HIPed) Ti-6Al-4V was seen to have less than half the high cycle fatigue strength (20 to 30 ksi versus 60 ksi) of equivalent sections from forged and machined impellers. A modified solution heat treatment and aging cycle was developed which restored the fatigue strength to approximately 50 ksi, and which provided adequate tensile strength and ductility. High cycle fatigue strength of weld repaired vanes was significantly lower than that of unwelded, however. Cast and machined wheels offer substantial cost savings over wheels conventionally machined from forgings. These savings may be as much as 50%, or about $900 per wheel. Author (GRA)

HYDRAULIC ACTUATOR MECHANISM TO CONTROL AIRCRAFT SPOILER MOVEMENTS THROUGH DUAL INPUT COMMANDS Patent

Stephen C. Irick, inventor (to NASA) Issued 9 Jun. 1981 5 p Filed 17 Aug. 1979 Supersedes N80-11065 (18 - 02, p 0148)

(NASA-Case-LAR-12412-1; US-Patent-4,272,046;
US-Patent-Appl-SN-067595; US-Patent-Class-244-226;
US-Patent-Class-244-78; US-Patent-Class-244,213;
US-Patent-Class-74-480R; US-Patent-Class-74-479) Avail: US Patent and Trademark Office CSCL 01C

An aircraft flight spoiler control mechanism is described. The invention enables the conventional, primary spoiler control system to retain its operational characteristics while accommodating a secondary input controlled by a conventional computer system to supplement the settings made by the primary input. This is achieved by interposing springs between the primary input and the spoiler control unit. The springs are selected to have a stiffness intermediate to the greater force applied by the primary control linkage and the lesser resistance offered by the spoiler control unit. Thus, operation of the primary input causes the control unit to yield before the springs, yet, operation of the secondary input, acting directly on the control unit, causes the springs to yield and absorb adjustments before they are transmitted into the primary control system.

EIGENSPACE TECHNIQUES FOR ACTIVE FLUTTER SUPPRESSION Semiannual Progress Report, 1 Oct. 1981 31 Mar. 1982

W. L. Garrard 31 Mar. 1982 116 p refs

(Grant NAG1-217)

(NASA-CR-168931; NAS 1.26:168931) Avail: NTIS HC A06/MF A0 CSCL 01C

Mathematical models to be used in the control system design were developed. A computer program, which takes aerodynamic and structural data for the ARW-2 aircraft and converts these data into state space models suitable for use in modern control synthesis procedures, was developed. Reduced order models of inboard and outboard control surface actuator dynamics and a second order vertical wind gust model were developed. An analysis of the rigid body motion of the ARW-2 was conducted. The deletion of the aerodynamic lag states in the rigid body modes resulted in more accurate values for the eigenvalues associated with the plunge and pitch modes than were obtainable if the lag states were retained. PREDICTION OF AIRCRAFT HANDLING QUALITIES USING ANALYTICAL MODELS OF THE HUMAN PILOT

Ronald A. Hess Apr. 1982 11 p refs

(NASA-TM-84233; A-8884; NAS 1.15:84233) Avail: NTIS HC A02/MF A01 CSCL 01C

The optimal control model (OCM) of the human pilot is applied to the study of aircraft handling qualities. Attention is focused primarily on longitudinal tasks. The modeling technique differs from previous applications of the OCM in that considerable effort is expended in simplifying the pilot/vehicle analysis. After briefly reviewing the OCM, a technique for modeling the pilot controlling higher order systems is introduced. Following this, a simple criterion for determining the susceptibility of an aircraft to pilot induced oscillations is formulated. Finally, a model based metric for pilot rating prediction is discussed. The resulting modeling procedure provides a relatively simple, yet unified approach to the study of a variety of handling qualities problems. R.J.F.

APPLICATION OF MODAL CONTROL TO WING-FLUTTER SUPPRESSION
Aaron J. Ostroff and Samuel Pines (Analytical Mechanics Associates, Inc., Jericho, N.Y.) May 1982 73 p refs
(NASA-TP-1983; L-14976; NAS 1.60:1983) Avail: NTIS HC A04/MF A01 CSCL 01C

A discrete modal control design approach that is applied to a single control surface, unswept aircraft wing subject to bending torsion flutter is described. The model approach is a mathematical method to decouple the equations of motion into isolated differential equations. In this paper, a pole-placement approach is then applied to determine stability gains in the discrete plane using only the two complex-conjugate flutter-mode equations. A fixed gain Kalman filter is used to estimate the model amplitudes using three measurements. Results are presented for a full-state estimator (36 states) and two reduced state estimators using two different closed-loop pole locations. The control law is designed for a dynamic pressure that is 50 percent greater than the uncontrolled-flutter dynamic pressure. With constant control-law gains, the closed-loop system remains stable over the dynamic-pressure range from flutter onset to approximately an 80-percent increase in pressure. M.D.K.

THE DETERMINATION OF CRITICAL FLUTTER CONDITIONS OF NONLINEAR SYSTEMS
D. L. Woodcock Mar. 1981 26 p refs
(RAE-TM-Struct-986; BR80499) Avail: NTIS HC A03/MF A01

Direct determination of limit cycles of the periodic motion of aeroelastic systems in transonic flow is discussed. A method of imposed disturbances, based on energy balance methods, is proposed. The Lagrange equation of motion is approximated by a nonlinear matrix differential equation into which a nondimensional time, omega t, is introduced. Omega is the frequency of the periodic motion. The frequency parameter based on omega, the airspeed, V, and a reference length is upsilon. The relationship between the amplitude of steady state oscillations and V, and whether these oscillations are stable, are determined. Any one of the unknowns, e.g., upsilon, can be used to find the others. Author (ESA)

A METHOD FOR DETERMINING THE AEROELASTIC BEHAVIOR OF AIRCRAFT WITH ACTIVE CONTROL SYSTEMS Ph.D. Thesis - Tech. Univ. Carolo-Wilhelmina, West Germany
Raymond Freymann Feb. 1982 129 p refs Transl. into ENGLISH from "Ueber das aeroelastische Verhalten von Flugzeugen mit aktiven Servo-Kontrollsystemen", Rept. DFVLR-FB-81-05 DFVLR, Goettingen, West Germany, Feb. 1981 Original report in GERMAN previously announced as N82-10047
(ESA-TT-719; DFVLR-FB-81-05) Avail: NTIS HC A07/MF A01; original report in GERMAN available at DFVLR Cologne DM 26.30

An analytical method for performing dynamic calculations on servocontrolled aircraft, based on an extended formulation of the generalized aeroelastic equations, is presented. The additional parameters introduces in the extended equations of motion are determined experimentally in a ground vibration test performed on a real aircraft structure as well as with help from an experimental-analytical method for determining the transfer functions of the hydraulic actuators. The elaborated method is shown to be satisfactory by comparison of measured and calculated data resulting from investigations performed on a model wing structure with a rudder driven by a hydraulic actuator. ENVIRONMENTAL FOG/RAIN VISUAL DISPLAY SYSTEM FOR AIRCRAFT SIMULATORS Patent
Wendell D. Chase, inventor (to NASA) Issued 2 Feb. 1982 28 p Filed 29 Jun. 1979 Supersedes N79-33220 (17 - 24, p 3180)
(NASA-Case-ARC-11158-1; US-Patent-4,313,726; US-Patent-Appl-SN-053566; US-Patent-Class-434-42; US-Patent-Class-434-43) Avail: US Patent and Trademark Office CSCL 14B

An environmental fog/rain visual display system for aircraft simulators is described. The electronic elements of the system include a real time digital computer, a caligraphic color display which simulates landing lights of selective intensity, and a color television camera for producing a moving color display of the airport runway as depicted on a model terrain board. The mechanical simulation elements of the system include an environmental chamber which can produce natural fog, nonhomogeneous fog, rain and fog combined, or rain only. A pilot looking through the aircraft wind screen will look through the fog and/or rain generated in the environmental chamber onto a viewing screen with the simulated color image of the airport runway thereon, and observe a very real simulation of actual conditions of a runway as it would appear through actual fog and/or rain. ADAPTIVE-WALL WIND-TUNNEL RESEARCH AT NASA-AMES RESEARCH CENTER
Edward T. Schairer and Joel P. Mendoza May 1982 16 p refs
(NASA-TM-84236; A-8893; NAS 1.15:84236) Avail: NTIS HC A02/MF A01 CSCL 14B

Adaptive wall wind tunnel research is summarized. Small scale two and three dimensional wind tunnel experiments and numerical experiments with a three dimensional adaptive wall simulator are included. A NACA 0012 airfoil was tested in a 25 by 13 cm slotted wall test section. Airflow through the test section walls was controlled by adjusting the pressures in segmented plenums. Interference free conditions were successfully attained in subsonic and transonic flows. For the three dimensional experiment, the 25 by 13 cm wind tunnel was modified to permit cross stream wall adjustments. The test model was a semispan wing mounted to one sidewall. Wall interference was substantially reduced at several angles of attack at Mach 0.60. A wing on wall configuration was also modeled in the numerical experiments. These flow simulations showed that free air conditions can be approximated by adjusting boundary conditions at only the floor and ceiling of the test section. No sidewall control was necessary. Typical results from these experiments are discussed. Author

ROLL RESPONSE CRITERIA FOR TRANSPORT AIRCRAFT WITH ADVANCED FLIGHT CONTROL SYSTEMS IN THE LANDING APPROACH AND TOUCHDOWN

M. F. C. vanGool 26 Oct. 1980 134 p refs
(Contracts NIVR-1745; RB-RLD/78017; RB-RLD/78017/1; RB-RLD/79036)
(NLR-TR-80103-U) Avail: NTIS HC A07/MF A01

Approach and landing of an aircraft equipped with a roll-rate-command/bank-angle-hold flight control system were investigated, using a moving base simulator. Pilot comments and ratings following systematic variation of roll mode time constant, maximum available roll rate, and pure time delay were noted. Results indicate that roll response criteria are too lenient. The more precise control of bank angle, available with the flight control system, leads to a higher internal standard of the pilot for his judgement of roll response quality. These control systems must comply with more strict requirements than conventional systems to obtain the same degree of pilot approval. Based on the experiments, limits/boundaries in existing criteria are redefined and criteria are proposed. Author (ESA)

(NASA-CR-166235; NAS 1.26:166235) Avail: NTIS HC A06/MF A01 CSCL 14B

A conceptual design study was conducted to define requirements for an advanced cab and visual system. The rotorcraft system integration simulator is for engineering studies in the area of mission associated vehicle handling qualities. Principally a technology survey and assessment of existing and proposed simulator visual display systems, image generation systems, modular cab designs, and simulator control station designs were performed and are discussed. State of the art survey data were used to synthesize a set of preliminary visual display system concepts of which five candidate display configurations were selected for further evaluation. Basic display concepts incorporated in these configurations included: real image projection, using either periscopes, fiber optic bundles, or scanned laser optics; and virtual imaging with helmet mounted displays. These display concepts were integrated in the study with a simulator cab concept employing a modular base for aircraft controls, crew seating, and instrumentation (or other) displays. A simple concept to induce vibration in the various modules was developed and is described. Results of evaluations and trade offs related to the candidate system concepts are given, along with a suggested weighting scheme for numerically comparing visual system performance characteristics. S.L.

SIMULATOR FOR AIR-TO-AIR COMBAT VERSUS REAL WORLD: VISUAL CUE ANALYSIS FOR SIMULATED AIR-TO-AIR COMBAT TRAINING Final Report

Robert E. Coward and Alexander M. Rupp Jan. 1982 26 p refs
(AF Proj. 1123)
(AD-A110570; AFHRL-TR-81-26) Avail: NTIS HC A03/MF A01 CSCL 05/9

Flying an aircraft requires a continuous interpretation of the visual environment in which the pilot uses visual information from outside the cockpit and from the flight instruments inside the cockpit to develop and maintain an awareness of the status of the aircraft and its location in space. Flying a high-speed/high-performance aircraft in an air-to-air combat environment vastly increases the complexity of the pilot's task. The pilot must also keep track of and evaluate the performance of any opposing aircraft. To maintain a dynamic awareness of the situation and ultimately to be successful in the airborne arena, the pilot depends heavily on interpretation of out-of-the-cockpit visual cues. Usually training of the necessary visual skills for air-to-air combat takes place entirely in the aircraft - a high stress environment where the student pilot quickly can become overwhelmed with visual information. In addition, the training is severely limited by both rules of engagement and aircraft safety limitations that prevent the student pilot from experiencing and practicing maximum performance tactics. GRA

CALCULATION OF THE CROSS SECTION PROPERTIES AND THE SHEAR STRESSES OF COMPOSITE ROTOR BLADES

Rudolf Woerndle 8 Sep. 1981 32 p refs Presented at 7th European Rotorcraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany, 8-11 Sep. 1981; sponsored by DGLR
(MBB-UD-334-81-O) Avail: NTIS HC A03/MF A01

Shear stress distribution and shear stiffness of transversely loaded cylindrical beams of any cross sectional shape are determined, using the finite element method. Warp, resulting from transverse load, is calculated with special two dimensional elements. If the warping of any cross section is known, shear stress distribution, shear stiffness, and shear center can be found. These values are obtained for any cross section through two dimensional analysis and, therefore, the whole structure must be considered. Stress distribution calculation results for complicated cross secions, i.e., for material that is homogeneous or inhomogeneous, isotropic or orthotropic, are shown. Because only small amounts of computational effort are necessary, the method is appropriate to the early design state. However, the validity of the theory is limited to small conus angles. MECHANICAL PROPERTIES OF HOT ISOSTATIC PRESSED P/M-TITANIUM FOR HELICOPTER COMPONENTS

Wolfgang Keinath and Marko Tapavicza 1981 31 p refs Presented at 7th European Rotorcraft and Powered Lift Aircraft Forum, Garmisch-Partenkirchen, West Germany, 8-11 Sep. 1981; sponsored by DGLR
(MBB-UD-324-81-O) Avail: NTIS HC A03/MF A01

The production of titanium alloy (Ti6Al4V) aircraft components was investigated. Powder metallurgy (P/M) manufacturing processes that involve hot isostatic pressing (HIP) and investment casting were characterized. The microstructure of P/M HIP Ti6Al4V bar and plate specimens is depicted. Mechanical properties were determined by static tensile and fatigue testing and a modified Goodman diagram was derived. Mechanical properties are the same as those of the corresponding wrought alloy. Static and dynamic values for a P/M HIP TiGAl4V blade fitting were also found from results of helicopter rotor hub component tests. Analysis shows that the blade fitting fulfills strength requirements. Reduction in machining as well as raw material weight savings when manufacturing P/M HIP components are pointed out. (Contract DAAK70-81-C-0134)
(AD-A110917; GTA-A-001) Avail: NTIS HC A04/MF A01 CSCL 21/4

Fire-resistant fuels have been investigated by the United States Army as a means of reducing the risk of fire in land combat vehicles and certain aircraft. One approach has been the use of high-molecular-weight polymer additives for suppression of mist formations. The polymers which are effective in mist suppression are very difficult to dissolve in fuel. A newly discovered process for dissolving high-molecular-weight polymers is investigated to determine its applicability to the preparation of mist suppression fuels. The conclusions area that certain high-molecular-weight polymers which show strong mist suppression behavior can be dissolved rapidly in diesel fuel and that the new dissolving process appears to be adaptable to field use. (AD-A110963; AFWAL-TR-81-3073-Vol-1) Avail: NTIS HC A12/MF A01 CSCL 01/3

An analysis and an interactive computer program are described through which minimum weight designs of composite, stiffened, cylindrical panels can be obtained subject to general and local buckling constraints and stress and strain constraints. The panels are subjected to arbitrary combinations of in-plane axial, circumferential, and shear resultants. Nonlinear material effects are included if the material is isotropic or has stiffness in only one direction (as does a discrete or a smeared stiffener). Several types of general and local buckling modes are included as constraints in the optimization process, including general instability, panel instability with either stringers or rings smeared out, local skin buckling, local crippling of stiffener segments, and general, panel, and local skin buckling including the effects of stiffener rolling. Certain stiffener rolling modes in which the panel skin does not deform but the cross section of the stiffener does deform are also accounted for. The interactive PANDA system consists of three independently executed modules that share the same data base. In the first module an initial design concept with rough (not necessarily feasible or accurate) dimensions are provided by the user in a conversational mode. In the second module the user decides which of the design parameters of the concept are to be treated by PANDA as decision variables in the optimization phase. In the third module the optimization calculations are carried out. Many examples are provided in which optimum designs obtained by PANDA are compared to those in the literature. Author (GRA)

RADAR FREQUENCY RADIATION Progress Report, Feb. 1978 - Sep. 1981

Edward Malowicki Nov. 1981 183 p ref
(AF Proj. 2059)
(AD-A111852; RADC-TR-81-347) Avail: NTIS HC A09/MF A01 CSCL 17/9

A method is presented for the determination of radar frequency radiation power densities that the PAVE PAWS radar system could produce in its air and ground environment. The effort was prompted by the concern of the people in the vicinity of OTIS AFB MA and BEALE AFB CA about the possible radar frequency radiation hazard of the PAVE PAWS radar. The method is based on the following main assumptions that: (a) the total field can be computed as the vector summation of the individual fields due to each antenna element; (b) the individual field can be calculated using distances for which the field point is in the far field of the antenna element. An RFR computer program was coded for the RADC HE 6180 digital computer and exercised to calculate the radiation levels in the air and ground space for the present baseline and the possible Six DB and 10 DB growth systems of the PAVE PAWS radar system at OTIS AFB MA. The average radiation levels due to the surveillance fence were computed for three regions: in the air space in front of the radar, at the radar hazard fence at OTIS AFB MA and at representative ground points in the OTIS AFB vicinity. It was concluded that the radar frequency radiation of PAVE PAWS does not present a hazard to personnel provided there is no entry to the air hazard zone or to the area within the hazard fence. The method developed offers a cost effective way to determine radiation levels from a phased array radar especially in the near field and transition regions. GRA

A CASE STUDY OF RELIABILITY AND MAINTAINABILITY OF THE F-16 APG-66 FIRE CONTROL RADAR M.S. Thesis

Daniel DeMarchi Sep. 1981 115 p refs
(AD-A111387; AFIT-LSSR-99-81) Avail: NTIS HC A06/MF A01 CSCL 17/9

During the development and test phase of weapon system acquisition, program management and design emphasis must be directed to producing a system that achieves reliability and maintainability in the field. Investigated were these development and test efforts and test efforts and the demonstrated operational performance of a major weapon subsystem in the form of a case study analysis of the F-16 fire control radar. Comparisons of predicted, test-demonstrated and operational APG-66 reliability and maintainability parameters constitute the significant portion of the analyses. In addition, the reliability and maintainability programs and selected performance indicators of the APG-66 and APQ-120 are compared in order to examine the results of differing test-program acquisition policies. This thesis effort determined that the APG-66 has not yet attained a constant failure rate indicative of an equipment's useful life. The research also determined that increased efforts in the test function of an acquisition produces significant benefits in operational results. A summary analysis of the entire program found the predictions based upon the critical design review and intermediate level maintainability demonstration to be somewhat optimistic. GRA

of the art of wind energy conversion systems (WECS) construction, operation, applications, and financial viability are presented. The economics of WECS were considered in terms of applicable tax laws, computer simulations of net value of WECS to utilities, and the installation of Mod-2 2.5 MW and WTS-4 4MW wind turbines near Medicine Bow, WY to test the operation of two different large WECS on the same utility grid. Potential problems of increasing penetration of WECS-produced electricity on a utility grid were explored and remedies suggested. The structural dynamics of wind turbines were analyzed, along with means to predict potential noise pollution from large WECS, and to make blade fatigue life assessments. Finally, Darrieus rotor aerodynamics were investigated, as were dynamic stall in small WECS and lightning protection for wind turbines and components. M.S.K.

A82-33707 # Effects of dynamic stall on SWECS. R. B. Noll (Aerospace Systems, Inc., Burlington, MA) and N. D. Ham (MIT, Cambridge, MA). *(Biennial Wind Energy Conference and Workshop, 5th, Washington, DC, Oct. 5-7, 1981.) ASME, Transactions, Journal of Solar Energy Engineering,* vol. 104, May 1982, p. 96-101. 12 refs.

A study of dynamic stall is presented in order to define its influence on the airfoil force and moment coefficients so that these effects can be included in the calculation of small wind energy conversion system (SWECS) loads and responses. A review of past work indicates that semiempirical methods are best suited to SWECS requirements. A definition of a dynamic stall theory is made for use in SWECS design, and the theory is implemented in SWECS loads and dynamic response analyses. Sample calculations are made for a representative vertical-axis machine. It is shown that loads and moments on the blades may be underestimated if dynamic stall is not considered. (Author)

A82-33708 # Darrieus rotor aerodynamics. P. C. Klimas (Sandia National Laboratory, Albuquerque, NM). *(Biennial Wind Energy Conference and Workshop, 5th, Washington, DC, Oct. 5-7, 1981.) ASME, Transactions, Journal of Solar Energy Engineering,* vol. 104, May 1982, p. 102-105. 19 refs. Contract No. DE-AC04-76DP-00789.

A summary of the progress of modeling the aerodynamic effects on the blades of a Darrieus wind turbine is presented. Interference is discussed in terms of blade/blade wake interaction and improvements in single and multiple stream tube models, of vortex simulations of blades and their wakes, and a hybrid momentum/vortex code to combine fast computation time with interference-describing capabilities. An empirical model has been developed for treating the properties of dynamic stall such as airfoil geometry, Reynolds number, reduced frequency, angle-of-attack, and Mach number. Pitching circulation has been subjected to simulation as potential flow about a two-dimensional flat plate, along with applications of the concepts of virtual camber and virtual incidence, with a cambered airfoil operating in a rectilinear flowfield. Finally, a need to develop a loading model suitable for nonsymmetrical blade sections is indicated, as well as blade behavior in a dynamic, curvilinear regime. M.S.K.

A82-33750 The TM 333, a trump card for Turbomeca (Le TM 333, atout majeur de Turbomeca). J. Morisset. *Air et Cosmos,* vol. 20, May 8, 1982, p. 13, 15-17. In French.

The new dual turbine, digital control TM 333 helicopter motor is described as having benefitted from a ten year program in basic aerodynamics, metallurgy, and electronics research. High compression, high expansions in reverse flow digitally controlled engines are coupled with improvements in the gear reductions and joints. The helicopter achieves program goals set in July 1979 of low operating cost, efficient fuel consumption over a broad power range, modular maintenance, fewer parts and lower purchase price, and low specific weight. The power plant furnishes a take-off impulse of 625 kW with a continuous output of 560 kW, with a fuel consumption of 319-330 gr/kWh. Specific performance features are listed and comparisons are made with turbines of other manufacturers. M.S.K.

A82-33853 # The superalloys - Materials for gas turbine hot section components. J. P. Immarigeon (National Aeronautical Establishment, Ottawa, Canada). *(Canadian Aeronautics and Space Institute, Annual General Meeting, 28th, Montreal, Canada, May 11, 1981.) Canadian Aeronautics and Space Journal,* vol. 27, Dec. 1981, p. 336-354. 80 refs.

Developments in materials technology for high temperature materials used in gas turbines are reviewed with emphasis on powder processing. Conditions under which turbine blades, vanes and disks operate are described, and material requirements for the three components are discussed. Advanced forming methods such as hot isostatic compaction of prealloyed powders and isothermal forging, and the rejuvenation of mechanical properties and subsequent recycling of used gas turbine components by hot isostatic pressing are considered. D.L.G.

A82-33854 # Operational testing of the LN-33 inertial navigation system. M. C. Mendrisky (Canadian Forces, Air Navigation School, Winnipeg, Canada). *(Canadian Symposium on Navigation, 4th, Halifax, Canada, Nov. 17, 1981.) Canadian Aeronautics and Space Journal,* vol. 27, Dec. 1981, p. 355-362.

An evaluation was performed to determine the baseline performance of the LN-33 Inertial Navigation System (INS). Tests designed include determination of geographic position accuracy in the pure inertial mode, determination of alignment quality, and the determination of a recommended time interval between system calibrations. Results of the navigation system testing on the Aurora, concentrating on the Doppler and Omega integrated operation of the INS, indicate that navigation will be more accurate in these modes of operation due to bounding effects and the fact that the INS itself performs better in this aircraft. D.L.G.

A82-33855 # Mechanical and metallurgical considerations in extending the life of turbine blades. J. Liburdi and J. Wilson. *(Canadian Aeronautics and Space Institute, Annual General Meeting, 28th, Montreal, Canada, May 11, 1981.) Canadian Aeronautics and Space Journal,* vol. 27, Dec. 1981, p. 363-374. Research supported by the National Research Council.

The paper outlines a systematic approach to blade life extension. Methods of predicting blade life and establishing life trends are discussed, and methods of repairing typical airfoil damage on turbine blades are outlined with general guidelines on repair limits and the influence of dissimilar filler metals on stress patterns. As blades reach their critical life they may be rejuvenated using hot isostatic pressing and appropriate heat treatments. A mechanical analysis demonstrates that limited repairs are possible on physically damaged components, and at present, repairs using a weaker filler material are limited to the lower-stressed region of the blade, such as near the tip and on top of the shroud. D.L.G.

A82-33891 # CDS grows new muscles. D. P. Raymer (Rockwell International Corp., Advanced Systems Design Dept., Los Angeles, CA). *Astronautics and Aeronautics,* vol. 20, June 1982, p. 22-31. 5 refs.

Recent improvements in the Configuration Development System (CDS) are discussed. Various design tasks that CDS can carry out are described, including fuselage development, wing and tail surfaces, initial structural design, fuel tanks and landing gear. New CDS abilities are also described, including the creation of command files, the modeling of existing designs for analysis or visualization, and doing on-line conceptual analysis of problems such as aerodynamic center and lift and moment derivatives, and friction drag. CDS can do tasks for which it was not specifically designed, and can perform any task that can be done on a drafting board. For the occasional user, CDS gives a productivity ratio of about four to one, while experienced users can expect an average improvement approaching ten to one. C.D.

A82-33892 # High technology raises fighter force readiness. R. C. Little, W. P. Murden, and R. K. Schaefer (McDonnell Douglas Corp., St. Louis, MO). *Astronautics and Aeronautics,* vol. 20, June 1982, p. 38-45, 61.

Evolutionary trends in U.S. tactical aircraft are discussed, emphasizing the role of high technology. The progressive increase in service life is accompanied by improved reliability. While digital technology in the aircraft has become more complex, there has been simplification in a number of areas, including electrical and plumbing connectors, hydraulic filters and lubrication points. Maintainability improvements include built-in test equipment and the Avionics Intermediate Shop, which uses automated test equipment to isolate a fault to an individual plug-in module. Though tactical aircraft potentially can fly two sorties per day, they are actually flying less than one. The problem derives from insufficient support services, and needed improvements are discussed in detail. C.D.

A82-33893 # The National Airspace System plan. J. L. Helms and S. B. Poritzky (FAA, Washington, DC). *Astronautics and Aeronautics,* vol. 20, June 1982, p. 50-61.

Major decisions, programs, and modernization plans of the National Airspace System are discussed. Greater cockpit control, automated weather observation systems, computerized ATC, and independent airborne Traffic Alert and Collision Avoidance Systems (TCAS) are anticipated. Near-term improvements include conflict-resolution advisories, en route metering, and improved terminal automation systems. The integration of traffic flow management and the use of TCAS are discussed in detail. Improved weather data will be obtained through the use of Doppler-radar technology, improved data bases, ground-based automated weather systems, and a central weather processor. The planned national airspace data interchange network will upgrade communications, and the Federal Radionavigation Plan will streamline navigation services. A modernized voice switching and control system, self-contained navigation systems, a microwave landing system, greater airport capacity, and facility consolidation are contemplated, and the plan as a whole is expected to be cost-effective. C.D.

A82-33904 Runway end intersection design. R. W. Hutchins (FAA, Albuquerque, NM). *Airport Forum,* Apr. 1982, p. 53-55.

One of a number of airport design problems involves the design of runway intersections. Frequently the involved runways intersect near their physical ends, and additional design parameters have to be taken into account. While runway length requirements, construction cost, and land availability will probably be the dominant design considerations, significant improvements in safety, cost, and convenience can be achieved by the selection of a particular intersection configuration. The four basic types of multiple runway layouts are classified as parallel, crossing, 'open V', and 'closed V'. Attention is given to aspects of aviation safety, ground traffic circulation, construction cost, capacity, the use of full runway length, and Navaid visual aid interference. A runway end intersection analysis is conducted, and the importance of taxiway access is discussed. G.R.

A82-33909 **The next generation trainer.** *Military Electronics/Countermeasures*, vol. 8, May 1982, p. 38, 40-42, 66.

In connection with a number of drawbacks regarding the T-37 twinjet trainers currently being used and the age of these aircraft, the U.S. Air Force is considering the introduction of a fleet of modernized aircraft for use in training undergraduate pilots at Randolph Air Force Base, TX. The T-37 have been manufactured between 1955 and 1977. They lack pressurization for high-altitude training, modern ejection seats, and fuel-efficient engines. The four Next Generation Trainer (NGT) prototypes the Air Force is considering incorporate these and other updated features. The first delivery of 54 trainers is expected to be set for September 30, 1987, when the service life of the original T-37s expires. A description is presented of the major specifications and stage of development of each of the four NGT, giving attention also to the manufacturers' reasons as to why their individual NGTs should be purchased by the Air Force. G.R.

A82-33913 # **The ubiquitous helicopter.** A. Gessow (Maryland, University, College Park, MD). *AIAA Student Journal*, vol. 19, Winter 1981-1982, p. 3-7, 48.

The theory, aerodynamics, and operation of helicopters are outlined and the extension of current technology to future versions of the helicopter for various applications is anticipated. Differences between helicopter and fixed-wing aircraft flight and control are discussed, noting the greater difficulty in maintaining stability low speeds in gusty conditions with helicopters. Blade and hub advances are reducing the complexity of the blade articulation to the drive train and rotor weight and strength are being tightly controlled by the use of composite materials. The wide rotor diameter distributes loads over a large area, allows heavy cargo to be carried, and provides a gliding force during power-out descents. Various commercial and military applications are enumerated. M.S.K.

A82-33914 # **XV-15 - Foretelling things to come.** L. H. Erb (Bell Helicopter Textron, Fort Worth, TX). *AIAA Student Journal*, vol. 19, Winter 1981-1982, p. 22-25.

The development of workable configurations of tilt-rotor aircraft culminating in the XV-15 is traced. The aircraft take off with the rotors on either wing situated like those of a helicopter then tilt the blades forward to proceed with high-speed flight, which has to date been 300 kn maximum. The XV-15 proved that natural frequencies and aeroelasticity of the rotors and airframe could be combined in a stable system, and also reconfirmed the possibility of control in both helicopter and airplane modes, problems originally solved with the XV-3. Early applications for the craft are foreseen for offshore oil rigs and on destroyers and frigates of the Navy. M.S.K.

A82-33915 # **X-wing and the Navy V/STOL initiative.** R. M. Williams (U.S. Defense Advanced Research Projects Agency, Arlington, VA). *AIAA Student Journal*, vol. 19, Winter 1981-1982, p. 26-34. 8 refs.

The development of concepts for Navy use of sea control ships (SCS) which could take advantage of V/STOL aircraft capabilities in intensive combat situations is outlined. The X-wing aircraft is offered as a solution to basing antisubmarine warfare and sensor carrier aircraft on ships which are not intended as aircraft carriers, such as frigates and destroyers. Use of the VTOL aircraft would permit force projection beyond the radar horizon in the form of cruise and air-to-air missiles borne by the X-wing. Combining advances in circulation control/tandem wing aerodynamics, high stiffness composite materials, and shaft-moment-feedback/fly-by-wire controls, a craft with low disk loading became possible. The X-wing is powered by a turbofan, and pneumatic control allows elimination of blade cycle pitch, rotor blade articulation, flaps, slots, and ailerons. M.S.K.

A82-33916 # **Will ABC technology produce the next-generation helicopter.** A. W. Linden (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *AIAA Student Journal*, vol. 19, Winter 1981-1982, p. 35-37.

Design concepts developed in order to overcome the retreating-blade stall limitations on level air speed flight for helicopters are reviewed. Compound vehicles were tested to utilize the rotating blades' lift capabilities in hover and the fixed wings' high-speed flight capacity. Inherent instability and low power efficiencies ruled against the design, and dual, counter-rotating propellers were tried in an attempt to discard any need for lift on the retreating blade. The resulting XH-59A test aircraft has risen to over 25,000 ft, made 60 deg turns at 225 kn, and has exceeded 260 kn air speed. The blades are mounted without hinges or flexible elements, thus improving reliability, maintainability, and aircraft handling and controllability. M.S.K.

A82-33920 # **The U.S. airline industry - En route to deregulation.** E. Starkman (Dowling College, Oakdale, NY). *AIAA Student Journal*, vol. 20, Spring 1982, p. 30-36. 6 refs.

The Airline Deregulation Act of 1978 and its consequences for the airline industry in the United States are discussed. The act is argued to have been a product both of public sentiment for reduced government regulation of private enterprise and the particular maturity of the airline industry, and it is noted that the actual deregulation act was preceded by a period of de facto selective deregulation beginning in 1977. Provisions of the act included the establishment of a fully competitive airline industry and the gradual dismantling, by January 1, 1985, of the Civil Aeronautics Board. Airlines have responded to the act by strengthening high-cost, long-haul routes at the expense of shorter routes while seeking to maintain feeder routes, in the case of the larger airlines, and explosive growth and the formation of entirely new carriers in the case of local service carriers. A.L.W.

A82-33993 **Formability of metallic materials - 2000 A.D.; Proceedings of the Symposium, Chicago, IL, June 24, 25, 1980.** Symposium sponsored by the American Society for Testing and Materials. Edited by J. R. Newby (Armco, Inc., Middletown, OH) and B. A. Niemeier (Reynolds Metals Co., Richmond, VA). Philadelphia, PA, American Society for Testing and Materials (ASTM Special Technical Publication, No. 753), 1982. 332 p. $39.50.

Reports included in this volume provide a broad review of worldwide developments in forming metallic materials along with specifics for manufacturing and potential formability technologies. Papers are presented on the effect of aging on bulk formability of aluminum alloys, hot forming of aluminum-magnesium alloy sheet, application of formability assessment to autobody outer panels, and the influence of tooling temperature on the formability of stainless steel sheets. Other papers include material flow and defect formation in forging an airfoil shape from metal-matrix composites, the use of torsion testing to assess material formability, and computer-aided modeling of selected sheet metal forming processes. V.L.

A82-33994 **Formability of INCOLOY alloy MA 956 - An oxide dispersion strengthened sheet alloy.** M. L. Robinson (Inco Research and Development Center, Inc., Suffern, NY) and I. Astley (Wiggin Alloys, Ltd., Hereford, England). In: Formability of metallic materials - 2000 A.D.; Proceedings of the Symposium, Chicago, IL, June 24, 25, 1980. Philadelphia, PA, American Society for Testing and Materials, 1982, p. 147-158.

The formability of INCOLOY alloy MA 956 (Fe - 19.5 wt% Cr - 4.5 wt% Al), designed for uses such as combustor components in gas turbine engines, has been evaluated using tension testing, cup testing, and strain analysis via the grid technique. An attempt has been made to interrelate the measured formability indexes utilizing relationships developed for conventional sheet alloys. It is concluded that although the alloy studied does not have the high degree of formability typical of conventional alloys, it does exhibit a usable degree of formability and can be formed into simple shapes. V.L.

A82-33995 **Material flow and defect formation in forging an airfoil shape from metal-matrix composites.** T. Erturk (Middle East Technical University, Ankara, Turkey) and H. A. Kuhn (Pittsburgh, University, Pittsburgh, PA). In: Formability of metallic materials - 2000 A.D.; Proceedings of the Symposium, Chicago, IL, June 24, 25, 1980. Philadelphia, PA, American Society for Testing and Materials, 1982, p. 176-186.

Major defects that occur in the forging of a 2024 aluminum alloy matrix reinforced with 25 vol% 0.23-mm-diameter cold drawn bcc stainless steel wires are identified using compression tests on rectangular specimens. These defects include fiber shear failure and accompanying deviation from plane-strain; fiber/matrix interface decohesion and accompanying void formation; the occurrence of cracks at the convex surfaces of rectangular preforms in forgings involving bending; and nonuniformity in fiber distribution. Forming limit criteria for the prediction and the prevention of these defects are established, presenting the allowable stress states during forging and providing guidelines for the forging of airfoil shapes from rectangular preforms. V.L.

A82-33997 **Low-speed aerodynamic characteristics of wings with sweep discontinuities.** S. M. Ramachandra (Hindustan Aeronautics, Ltd., Design Bureau, Bangalore, India; Alfateh University, Tripoli, Libya) and S. Prakash (Hindustan Aeronautics, Ltd., Bangalore; Indian Space Research Organization, Vikram Sarabhai Space Centre, Trivandrum, India). *Indian Academy of Sciences, Proceedings, Section C: Engineering Sciences*, vol. 4, Dec. 1981, p. 437-447. 19 refs.

It is shown that, using the concept of a discrete vortex filament shedding, Weissinger's method can be modified to determine the span-wise loading for wings with a sweep discontinuity. The sweep discontinuity is modeled by the introduction of a discontinuity in the equivalent vortex pattern chosen to replace the wing. The total lift, induced drag, pitching moment coefficients and span-wise location of the center of pressure have been found for a few wing geometries using De Young and Harper's procedure. An increase in the outboard sweep shifts the maximum load position outboard besides decreasing the overall lift and induced drag coefficients. High suction peaks appear at the pivot. (Author) strategic elements, advanced processing concepts, and the identification of alternate materials are considered. Cobalt, tantalum, columbium, and chromium, the supplies of which are 91-100% imported, are the materials of major concern. J.D.

IMPACT STUDY OF SYNTHETIC AND ALTERNATIVE FUEL USAGE IN ARMY AIRCRAFT PROPULSION SYSTEMS Final Report, Oct. 1980 - Jun. 1981

C. A. Moses and M. I. Valtierra Jul. 1981 166 p refs Sponsored in part by the Army Mobility Research and Development Command
(Contract N00140-80-C-2269)
(AD-A111046; SwRI-MED134) Avail: NTIS HC A08/MF A01 CSCL 21/4

The U.S. Army is concerned about the quality of future aircraft fuels and their compatibility with current engines and aircraft fuel systems. This impact study of synthetic and alternate fuel usage on Army aircraft propulsion and fuel systems addresses four technical areas: (1) The fuel scenario for Army aviation gas turbine fuels; (2) The effects of initial properties or the performance and durability of engine and fuel system components; (3) The identification of engines and fuel system components used in Army aircraft and their interface with the fuel; and (4) A review of qualification and certification procedures. ADAPTER FOR MOUNTING MICROPHONE FLUSH WITH THE EXTERNAL SURFACE OF THE SKIN OF A PRESSURIZED AIRCRAFT Patent Application

Robert B. Cohn, inventor (to NASA) Filed 14 Dec. 1981 14 p
(NASA-Case-FRC-11072-1; US-Patent-Appl-SN-330613) Avail: NTIS HC A02/MF A01 CSCL 14B

A mounting device for securing a microphone pick-up head flush with respect to the external surfaces of the skin of an aircraft for detecting shock waves is described. The mount includes a sleeve mounted internally of the aircraft for capturing and supporting an electronics package having the microphone pick-up head attached such that the head is flush with the external surface of the aircraft skin and a pressure seal is established between the internal and external surfaces of the aircraft skin. DEVELOPMENT OF HIGH-SPEED ROLLING-ELEMENT BEARINGS. A HISTORICAL AND TECHNICAL PERSPECTIVE

Erwin V. Zaretsky 1982 28 p refs Presented at the SKF Seventy-Fifth Anniv. Celebration Meeting, Nieuwegin, Netherlands, 9 Jun. 1982; sponsored by SKF Research and Development Center
(NASA-TM-82884; E-1198; NAS 1.15:82884) Avail: NTIS HC A03/MF A01 CSCL 13I

Research on large-bore ball and roller bearings for aircraft engines is described. Tapered roller bearings and small-bore bearings are discussed. Temperature capabilities of rolling element bearings for aircraft engines have moved from 450 to 589 K (350 to 600 F) with increased reliability. High bearing speeds to 3 million DN can be achieved with a reliability exceeding that which was common in commercial aircraft. Capabilities of available bearing steels and lubricants were defined and established. Computer programs for the analysis and design of rolling element bearings were developed and experimentally verified. The reported work is a summary of NASA contributions to high performance engine and transmission bearing capabilities. R.J.F.

COMPARISON BETWEEN PROBABILITY OF DETECTION, SENSITIVITY, AND ACCURACY OF FIVE NONDESTRUCTIVE INSPECTION METHODS

E. A. B. deGraaf and P. deRijk 25 Jun. 1981 13 p refs In DUTCH; ENGLISH summary Presented at Europaeische Tagung fuer zerstoerungsfreie Pruefung, Vienna, 14-16 Sep. 1981
(NLR-MP-81038-U) Avail: NTIS HC A02/MF A01

Approximately 200 high strength steel (AISI4340) aircraft undercarriage retraction cylinders, only part of which contained fatigue tracks, were subjected to five different nondestructive tests by six inspectors. Penetrants, ultrasonic flaw detection, eddy currents, and magnetic measurements were used. Results of all these methods and inspectors were compared. Considerable scattering in the results was observed. The ultrasonic method reliability is low. The results of fluorescent color penetration and eddy currents are moderate. Due to its high reliability, magnetic inspection is preferred. Author (ESA)

NONLINEAR STRUCTURAL AND LIFE ANALYSES OF A COMBUSTOR LINER

V. Moreno (Pratt and Whitney Aircraft Group, East Hartford, Conn.), G. J. Meyers (Pratt and Whitney Aircraft Group, East Hartford, Conn.), A. Kaufman, and G. R. Halford 1982 23 p refs Proposed for presentation at the Symp. on Advances and Trends in Struct. and Solid Mech., 4-7 Oct. 1982, Washington, D.C.; sponsored by NASA and Georgetown Univ.
(NASA-TM-82846; E-1216; NAS 1.15:82846) Avail: NTIS HC A02/MF A01 CSCL 20K

Three dimensional, nonlinear finite element structural analyses were performed for a simulated combustor liner specimen to assess the capability of nonlinear analyses using classical inelastic material models to represent the thermoplastic creep response of the one half scale component. Results indicate continued cyclic hardening and ratcheting while experimental data suggested a stable stress strain response after only a few loading cycles. The computed stress strain history at the critical location was put into two life prediction methods, strainrange partitioning and a Pratt and Whitney combustor life prediction method to evaluate their ability to predict cyclic crack initiation. It is found that the life prediction analyses over predicted the observed cyclic crack initiation life. E.A.K.

EVALUATION OF INELASTIC CONSTITUTIVE MODELS FOR NONLINEAR STRUCTURAL ANALYSIS

Albert Kaufman 1982 22 p refs Presented at the Symp. on Nonlinear Constitutive Relations for High Temp. Appl., Akron, Ohio, 19-20 May 1982; sponsored by NASA and Akron Univ.
(NASA-TM-82845; E-1215; NAS 1.15:82845) Avail: NTIS HC A02/MF A01 CSCL 20K

The influence of inelastic material models on computed stress-strain states, and therefore predicted lives, was studied for thermomechanically loaded structures. Nonlinear structural analyses were performed on a fatigue specimen which had been subjected to thermal cycling in fluidized beds and on a mechanically load cycled benchmark notch specimen. Four incremental plasticity creep models (isotropic, kinematic, combined isotropic kinematic, combined plus transient creep) were exercised using the MARC program. Of the plasticity models, kinematic hardening gave results most consistent with experimental observations. Life predictions using the computed strain histories at the critical location with a strainrange partitioning approach considerably overpredicted the crack initiation life of the thermal fatigue specimen. REPORT FROM THE WORKING PARTY ON NEW FIBER MATERIALS [AUS DER ARBEIT DES ARBEITSKREISES NEUARTIGE FASERWERKSTOFFE (ANF)]

C. Kensche 1981 12 p In GERMAN Presented at 5th Symp. fuer Segelflugzeugentwicklung, Brunswick, 16-17 Nov. 1981
Avail: NTIS HC A02/MF A01

The aims, activities and achievements of a working party on new fiber composites are discussed. Participants from industry and research institutions collaborated on the drafting of norms and specification sheets for these materials.. Further research items include experimentation test stands and standardization of test procedures. Results on maximum yield stresses under tension, compression or shear are given for various specimens as well as in relation to fuselages or hulls. Author (ESA)

THE VIBRATORY BEHAVIOR OF A ROTATING PROPELLER

SHAFT. PART 4: VIBRATION TESTS OF A ROTATING PROPELLER SHAFT IN A RUBBER STERN TUBE BEARING
A. J. Francken and G. C. vanVelzen Dec. 1980 80 p refs
(Contract A76/KM/134)
(IWECO-5072208-81-Pt-2; TDCK-75126-Pt-2) Avail: NTIS HC A05/MF A01

Lateral shaft vibration was tested by measuring shaft and bearing response to horizontal and vertical excitation. Results show no change in shaft position between the nonrotating and the rotating shaft at speeds up to 120 RPM. Resonance frequencies and driving point mobility deviate < 3% from reported values. Damping at 120 RPM amounts to 5% of critical damping at both resonances. Author (ESA)

FUEL QUALITY PROCESSING STUDY, VOLUME 1 Final Report
J. B. OHara, A. Bela, N. E. Jentz, H. T. Syverson, H. W. Klumpe, R. E. Kessler, H. T. Kotzot, and B. L. Loran Apr. 1981 203 p refs 2 Vol.
(Contracts DEN3-183; DE-AI01-77ET-13111)
(NASA-CR-165327-Vol-1; DOE/NASA/0183-1; NAS 1.26:165327-Vol-1) Avail: NTIS HC A10/MF A01 CSCL 21D

A fuel quality processing study to provide a data base for an intelligent tradeoff between advanced turbine technology and liquid fuel quality, and also, to guide the development of specifications of future synthetic fuels anticipated for use in the time period 1985 to 2000 is given. Four technical performance tests are discussed: on-site pretreating, existing refineries to upgrade fuels, new refineries to upgrade fuels, and data evaluation. The base case refinery is a modern Midwest refinery processing 200,000 BPD of a 60/40 domestic/import petroleum crude mix. The synthetic crudes used for upgrading to marketable products and turbine fuel are shale oil and coal liquids. Of these syncrudes, 50,000 BPD are processed in the existing petroleum refinery, requiring additional process units and reducing petroleum feed, and in a new refinery designed for processing each syncrude to produce gasoline, distillate fuels, resid fuels, and turbine fuel, JPGs and coke. An extensive collection of synfuel properties and upgrading data was prepared for the application of a linear program model to investigate the most economical production slate meeting petroleum product specifications and turbine fuels of various quality grades. Technical and economic projections were developed for 36 scenarios, based on 4 different crude feeds to either modified existing or new refineries operated in 2 different modes to produce 7 differing grades of turbine fuels. A required product selling price of turbine fuel for each processing route was calculated. Procedures and projected economics were developed for on-site treatment of turbine fuel to meet limitations of impurities and emission of pollutants. R.J.F.

AIRBUS INDUSTRY AND NOISE IN THE COMMUNITY
J. Chaussonnet 7 Jan. 1982 37 p Presented at Symp. on Aircraft Noise Johannesburg, 21 Oct. 1981; sponsored by South African Acoustic Inst.
(SNIAS-821-111-111) Avail: NTIS HC A03/MF A01

The contribution to the total perceived noise outside an aircraft during takeoff and landing, attributed to engines and the aerodynamics of the aircraft, is considered. Engine noise reduction by design, location of the engine, and by acoustic analysis of the nacelle is discussed. Aerodynamic noise reduction is treated in terms of aircraft design, operational procedures, and aircraft weight. The noise measurement facility used for checking operational procedures and measuring noise levels, is described. Results show that the acoustic noise of commercial aircraft can be significantly reduced. Author (ESA)

FLIGHT MANAGEMENT COMPUTER
J. Grossin 7 Jan. 1982 26 p In FRENCH Presented at Soc. des Electriciens et des Radioelectriciens (SEE), Nice, 26 Nov. 1981 Submitted for Publication
(SNIAS-821-111-110) Avail: NTIS HC A03/MF A01

Ways in which automatic flight control can reduce fuel consumption were investigated. Three domains were identified:

A literature study for the techniques suitable for a portable wear metal analyzer has been conducted. The intent was to locate a technique which could lead to the development of a deployable field instrument to analyze metals in used aircraft engine oil for preventive maintenance purposes. Ten techniques, including six optical spectroscopic methods, two X-ray techniques, radioactive tagging, and colorimetry, were evaluated. Emphasis was placed on the fundamental limitations of each technique for this particular application. As a result, three optical techniques looked promising and their practicality was further investigated. The final assessment of these three techniques was based on the feasibility of making the instrument portable, low cost, able to analyze elements of interest, particle size independent, and with moderate power consumption. The three techniques, in order of suitability are: furnace atomic absorption spectroscopy, rotating disc electrode atomic emission spectroscopy, and dc plasma atomic emission spectroscopy. MATHEMATICAL MODELS FOR THE SYNTHESIS AND OPTIMIZATION OF SPIRAL BEVEL GEAR TOOTH SURFACES Final Report
F. L. Litvin, Pernez Rahman, and Robert N. Goldrich Jun. 1982 122 p refs
(Grant NAG3-48)
(NASA-CR-3553; NAS 1.26:3553) Avail: NTIS HC A06/MF A01 CSCL 13I

The geometry of spiral bevel gears and to their rational design are studied. The nonconjugate tooth surfaces of spiral bevel gears are, in theory, replaced (or approximated) by conjugated tooth surfaces. These surfaces can be generated by two conical surfaces, and by a conical surface and a revolution. Although these conjugated tooth surfaces are simpler than the actual ones, the determination of their principal curvatures and directions is still a complicated problem. Therefore, a new approach, to the solution of these is proposed. Direct relationships between the principal curvatures and directions of the tool surface and those of the generated gear surface are obtained. With the aid of these analytical tools, the Hertzian contact problem for conjugate tooth surfaces can be solved. These results are useful in determining compressive load capacity and surface fatigue life of spiral bevel gears. A general theory of kinematical errors exerted by manufacturing and assembly errors is developed. This theory is used to determine the analytical relationship between gear misalignments and kinematical errors. This is important to the study of noise and vibration in geared systems. S.L.

N82-25520*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
LUBRICANT EFFECTS ON EFFICIENCY OF A HELICOPTER TRANSMISSION
Andrew M. Mitchell and John J. Coy 1982 16 p refs Presented at the AGARD Symp. on Probl. in Bearings and Lubrication, Ottawa, Canada, 31 May - 4 Jun. 1982
(NASA-TM-82857; E-1226; NAS 1.15:82857; AVRADCOM-TR-82-C-9) Avail: NTIS HC A02/MF A01 CSCL 01C

Eleven different lubricants were used in efficiency tests conducted on the OH-58A helicopter main transmission using the NASA Lewis Research Center's 500 hp torque regenerative helicopter transmission test stand. Tests were run at oil-in temperatures of 355 K and 372 K. The efficiency was calculated from a heat balance on the water running through an oil to water heat exchanger which the transmission was heavily insulated. Results show an efficientcy range from 98.3% to 98.8% which is a 50% variation relative to the losses associated with the maximum efficiency measured. For a given lubricant, the efficiency increased as temperature increased and viscosity decreased. There were two exceptions which could not be explained. Between lubricants, efficiency was not correlated with viscosity. There were relatively large variations in efficiency with the different lubricants whose viscosity generally fell in the 5 to 7 centistoke range. The lubricants had no significant effect on the vibration signature of the transmission. A.R.H.

CHEM-BRAZE ABRADABLE SEAL ATTACHMENT TO AIRCRAFT GAS TURBINE COMPRESSOR COMPONENTS Final Report, 1 Nov. 1979 - 31 Sep. 1980
Stephen T. Narsavage, Saed Safai, and Harold W. Pettit, Jr. St. Louis Army Aviation Research and Development Command Jan. 1982 71 p
(Contract DAAG46-79-C-0102)
(AD-A111692; PWA-FR-13975; USAAVRADCOM-TR-82-F-2; AMMRC-TR-82-6) Avail: NTIS HC A04/MF A01 CSCL 11/2

Manufacturing methods were established for bonding an abradable seal surface onto the stationary compressor element of small gas turbine engines utilizing an easily replaceable Chem-Braze bond system. Bonded specimens were prepared and evaluated in vibration and rub incursion tests. Tooling was fabricated for bonding a seal to Army supplied engine hardware, and NDI methods were established for inspecting bond integrity. Chemical stripping techniques for removing Chem-Braze attached seals were optimized to permit efficient refurbishment of severely worn seals. An economic analysis indicated significant cost savings for attaching abradable seals to compressor blade tip shrouds using the improved Chem-Braze system compared to attachment with gold-nickel braze. The Chem-Braze system has been used successfully to bond abradable seals to titanium, cobalt, nickel and iron base alloys; however, attempts to use Chem-Braze to bond seals to selected aluminum and magnesium alloys were not successful. Reports of three related studies germane to structural optimization are provided. The first describes virtual memory simulator suitable for management of large quantities of numerical data such as required for sparse matrix manipulation. The second report describes two sparse matrix processors suitable for the large equation systems arising in structural analysis and provides comparative results. The last report describes a study of two optimization algorithms in the context of structural optimization. A number of test results for parameter studies and a general comparison of the two algorithms are given. GRA

This report contains an analysis of the Source Assessment Procedures at both Defense Mapping Agency (DMA) production facilities (Aerospace Center DMAAC in St. Louis MO and Hydrographic Topographic Center DMAHTC in Washington DC). Following the analysis, the report documents a design trade off of various approaches to a Source Assessment System. Finally, a Design Plan for the selected approach analog-digital video system, is presented. Author (GRA)

LOW NOx HEAVY FUEL COMBUSTOR CONCEPT PROGRAM Final Report
A. S. Novick and D. L. Troth Oct. 1981 206 p refs
(Contracts DEN3-148; DE-AI01-77ET-13111)
(NASA-CR-165367; NAS 1.26:165367; DDA-EDR-10594; DOE/NASA/0148-1) Avail: NTIS HC A10/MF A01 CSCL 10B

The development of the technology required to operate an industrial gas turbine combustion system on minimally processed, heavy petroleum or residual fuels having high levels of fuel-bound nitrogen (FBN) while producing acceptable levels of exhaust emissions is discussed. Three combustor concepts were designed and fabricated. Three fuels were supplied for the combustor test demonstrations: a typical middle distillate fuel, a heavy residual fuel, and a synthetic coal-derived fuel. The primary concept was an air staged, variable-geometry combustor designed to produce low emissions from fuels having high levels of FBN. This combustor used a long residence time, fuel-rich primary combustion zone followed by a quick-quench air mixer to rapidly dilute the fuel rich products for the fuel-lean final burnout of the fuel. This combustor, called the rich quench lean (RQL) combustor, was extensively tested using each fuel over the entire power range of the model 570 K engine. Also, a series of parameteric tests was conducted to determine the combustor's sensitivity to rich-zone equivalence ratio, lean-zone equivalence ratio, rich-zone residence time, and overall system pressure drop. Minimum nitrogen oxide emissions were measured at 50 to 55 ppmv at maximum continuous power for all three fuels. Smoke was less than a 10 SAE smoke number. M.G.

IN SITU OZONE DATA FOR COMPARISON WITH LASER ABSORPTION REMOTE SENSOR: 1980 PEPE/NEROS PROGRAM
David S. McDougal, Robert B. Lee, III, and Richard J. Bendura May 1982 42 p refs
(NASA-TM-84471; NAS 1.15:84471) Avail: NTIS HC A03/MF A01 CSCL 13B

Several sets of in situ ozone (O3) measurements were made by a NASA aircraft in support of the laser absorption spectrometer (LAS) remote sensor. These measurements were designed to provide comparative O3 data for the LAS sensor. The LAS, which was flown on a second aircraft, remotely measured the vertical burden of O3 from the aircraft to the surface. In situ results of the air quality (O3 and B sub scat) and meteorological (temperature and dewpoint) parameters for three correlative missions are presented. The aircraft flight plans, in situ concentration profiles and vertical burdens, and measurement errors are summarized. B.W.

AN ASSESSMENT OF THE REAL-TIME APPLICATION CAPABILITIES OF THE SIFT COMPUTER SYSTEM
Ricky W. Butler Apr. 1982 17 p refs
(NASA-TM-84482; NAS 1.15:84482) Avail: NTIS HC A02/MF A01 CSCL 09B

The real-time capabilities of the SIFT computer system, a highly reliable multicomputer architecture developed to support the flight controls of a relaxed static stability aircraft, are discussed. The SIFT computer system was designed to meet extremely high reliability requirements and to facilitate a formal proof of its correctness. Although SIFT represents a significant achievement in fault-tolerant system research it presents an unusual and restrictive interface to its users. The characteristics of the user interface and its impact on application system design are assessed. Author

SILICON LIQUID CRYSTAL LIGHT VALVE FOR FLIGHT SIMULATION APPLICATIONS Final Report
U. Efron, J. Grinberg, P. G. Reif, and P. Braatz Brooks AFB, Tex. AFHRL Nov. 1981 118 p refs
(Contract F33615-79-C-0024; AF Proj. 2363)
(AD-A110928; AFHRL-TR-81-35) Avail: NTIS HC A06/MF A01 CSCL 20/2

The basic objective of this program has been to develop a silicon photoconductor liquid crystal light valve (Si LCLV) for application in wide-field-of-view simulators. The Si LCLV is expected to offer several advantages over the cadmium sulfide (CdS) photoconductor LCLV, including higher sensitivity, a significantly better switching ratio, higher resolution, and (most importantly) a fast response time to allow higher 60-Hz operation. The main thrust of this program was to upgrade the device in the following areas: (1) Scale up to a 2-inch aperture device (from a 1 cm x 1 cm active area). (2) Implement the silicon/silicon dioxide (Si/SiO2) dielectric mirror and improve the light blocking layer. (3) Upgrade device resolution by optimizing the focusing grid. (4) Increase the contrast ratio by improving silicon processing. (5) Implement the dc-biased guard ring to prevent edge breakdown. (6) Optimize liquid crystal operation to reduce the reponse time. Significant improvements were achieved in all areas. GRA

INVESTIGATION ON ROTATING AILERONS
S. Mozumdar and T. S. Patel *In* Indian Inst. of Science The J. of the Aeron. Soc. of India, Vol. 32, No. 1-4, Feb.-Nov. 1980 Nov. 1980 p 1-5 refs

Avail: NTIS HC A08/MF A01

The effectiveness of rotating ailerons in a subsonic flow was theoretically studied with a view to evaluate their capability in comparison to the conventional ones. The present analysis is based on the vortex lattice approach of Byelotserkovskii for different wing planforms of small and large aspect ratios. The effect of such ailerons on the coefficients of lift and rolling moment was worked out for their positions corresponding to the most suitable positions of rotating flaps. Author

PRIMARY SEWAGE TREATMENT PLANT AS A SOURCE OF BIRD HAZARDS AT AIRPORT
S. C. Pillai, M. K. C. Sridhar, and G. Kasi Viswanath *In* Indian Inst. of Science The J. of the Aeron. Soc. of India, Vol. 32, No. 1-4, Feb.-Nov. 1980 Nov. 1980 p 149-153 refs

Avail: NTIS HC A08/MF A01

Quantitative observations were made on the visits of different kinds of birds, notably eagles or kites and crows, and on their movements around the different parts of the primary sewage treatment plant located in the neighborhood of the airport at Bangalore. The following information is reported: (1) early records on collisions between birds and aircrafts; (2) bird strike as a world wide problem; (3) the reasons for the attraction of birds to airports; (4) early attempts to solve the problem of bird hazards;

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. A82-31824 # **Identification of the form of motion of an aircraft (Identyfikacja postaci ruchu samolotu).** A. Banasik. *Instytut Lotnictwa, Prace,* no. 86, 1981, p. 13-25. In Polish.

Methods for identifying the form of the motion of an arbitrary vibrating system described by a set of ordinary linear equations with constant coefficients are surveyed. The fundamental parameters of the set of equations (the state matrix, the state vector, and the dynamic stability criterion) are determined on the basis of calculated eigenvalues. The eigenvectors corresponding to particular eigenvalues are determined, which characterizes the state vector for a given eigenvalue. Particular emphasis is placed on an identification method which consists in obtaining an analytic solution of the system of differential equations of motion. Numerical examples are presented concerning the lateral dynamic stability of an aircraft treated as a rigid body. B.J.

A82-31853 * # **Approximate method of predicting heating on the windward side of Space Shuttle Orbiter and comparisons with flight data.** H. H. Hamilton, II (NASA, Langley Research Center, Space Systems Div., Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0823.* 15 p. 30 refs.

An approximate method is developed for predicting laminar and turbulent heating rates on the windward side of the Space Shuttle Orbiter for both the wind-tunnel and flight environments. The method is based on a 'local infinite swept cylinder' analysis and includes both equilibrium-air chemistry and variable boundary-layer-edge entropy. The method is validated by comparing with data from wind-tunnel experiments and from the first and second Space Shuttle flights both along the windward-symmetry plane and in a lateral direction off the symmetry plane. Agreement with the flight data is good from approximately 67 km (peak heating) downward. (Author)

A82-31871 # **Thermodynamic performance of an airplane wing leading edge anti-icing system.** R. Ross (Ross Aviation Associates, Sedgwick, KS). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0851.* 5 p.

Flight data gathered from dry air tests are used to develop a procedure that will predict the spanwise and chordwise surface temperature distribution for any aircraft for either dry air or icing conditions. It is shown that wing leading edge surface temperatures can be estimated within plus or minus 5% for dry air and plus or minus 10 percent for natural icing for a wide range of aircraft conditions. The method is somewhat conservative for dry air conditions and quite conservative for icing conditions. (Author)

A82-31883 * # **Radiation enhancement by nonequilibrium during flight through the Titan atmosphere.** C. Park (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0878.* 16 p. 40 refs.

The chemical reactions occurring in the adiabatic inviscid shock layer over a two-dimensional wedge flying through Titan's atmosphere are calculated. Radiative transfer through the shock layer is calculated, accounting for the deviation of electronic state populations from the equilibrium distributions, to determine the heat flux reaching the edge of the boundary layer of the proposed Titan Aerocapture vehicle. The heat fluxes are found to be larger by a ratio of up to 100,000 than those calculated under the assumption of equilibrium flow. For a typical flight, the radiative heat load reaching the edge of the boundary layer is 3.4 x 10 to the 5th J/sq cm, which is 5.7 times the equilibrium value. (Author)

A82-31891 * # **An experimental investigation of interfacial temperatures in blade-seal material rubbing of aircraft compressors.** A. F. Emery, J. Wolak, S. Etemad, and S. R. Choi (Washington, University, Seattle, WA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0890.* 8 p. 5 refs. NASA-sponsored research.

Results are presented for the rubbing of rotating (100 m/s) titanium blade specimens, with different plasma-sprayed tip coating, against an abradable porous seal material at two different incursion rates. In general, there was a good correspondence between the average transverse force of rubbing and the seal specimen surface temperature. Instantaneous seal surface temperature measurement showed a significant temperature jump before and after each rubbing with a high rate of cooling during each revolution and a high overall temperature level. Numerical predictions of both blade and seal temperature agreed well for the bare blade tip experiments but were consistently high for the coated blades. This suggests that the thermal properties of the coatings may significantly affect the temperatures and hence the wear characteristics of the system. (Author)

A82-31898 * # **Design, fabrication and test of liquid metal heat-pipe sandwich panels.** A. Basiulis (Hughes Aircraft Co., Torrance, CA) and C. J. Camarda (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0903.* 8 p. 9 refs.

Integral heat-pipe sandwich panels, which synergistically combine the thermal efficiency of heat pipes and the structural efficiency of honeycomb sandwich panel construction, were fabricated and tested. The designs utilize two different wickable honeycomb cores, facesheets with screen mesh sintered to the internal surfaces, and potassium or sodium as the working fluid. Panels were tested by radiant heating, and the results indicate successful heat pipe operation at temperatures of approximately 922 K (1200 F). These panels, in addition to solving potential thermal stress problems in an Airframe-Integrated Scramjet Engine, have potential applications as cold plates for electronic component cooling, as radiators for space platforms, and as low distortion, large area structures. (Author)

A82-31922 # **A system for the numerical simulation of sub- and transonic viscous attached flows around wing-body configurations.** J. van der Vooren, J. T. van der Kolk, and J. W. Slooff (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO,*

A82-34007 * # **A review of Reynolds number studies conducted in the Langley 0.3-m Transonic Cryogenic Tunnel.** E. J. Ray (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0941.* 15 p. 26 refs.

Initial proof-of-concept results obtained in a pilot transonic tunnel, led to a U.S. decision to apply the cryogenic tunnel concept to the National Transonic Facility (NTF). The pilot tunnel was reclassified as a 'permanent' facility and renamed the 0.3-m Transonic Cryogenic Tunnel (TCT). The 0.3-m TCT, with its ability to operate at temperatures ranging from about 78 K to 340 K, combined with a 6 atmospheres pressure capability, provides extremely high test Reynolds numbers at relatively low model loading. In addition, the ability to vary pressure and temperature independently of Mach number provides a unique capability to conduct studies at a constant dynamic pressure or at a constant Reynolds number with just one model. Attention is given to the simulation of flight conditions, the cryogenic-pressure tunnel concept, the characteristics of the 0.3-m TCT, Reynolds number studies in the three-dimensional test section including a Space Shuttle study, and Reynolds number studies in the two-dimensional test section. G.R.

A82-34008 * # **Wing flap-type control effectiveness and effects of control hinge gap seals for a supercritical wing.** E. L. Anglin and T. A. Byrdsong (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0960.* 14 p. 11 refs.

Wind-tunnel tests were made to investigate the control effectiveness of wing trailing-edge flap-type aerodynamic controls for a supercritical wing. The tests determined the effects of spanwise flap control location, two different wing transition grit location patterns, magnitude of angular control deflection, control hinge moments and control hinge gap seals. Results show that the inboard flap position deflections caused interference rearward at the vertical tail, and that all flap positions for deflections in one direction only caused interference at the horizontal tail at a higher than design Mach number. Changes in wing transition grit pattern caused significant changes to static longitudinal characteristics and longitudinal control effectiveness. D.L.G.

A82-34101 * **International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981.** Symposium sponsored by the U.S. Department of Commerce, NASA, and U.S. Air Force. Edited by J. Grey (American Institute of Aeronautics and Astronautics, New York, NY) and L. A. Hamdan. New York, American Institute of Aeronautics and Astronautics (AIAA Aerospace Assessment Series. Volume 6), 1982. 318 p. Members, $25.; nonmembers, $30.

The status of aerospace industrial development in various countries is summarized, and specific areas of current and future progress are discussed. The first Shuttle astronauts recount details of the flight and performance of the initial Columbia mission and an attempt to assess the importance of the Shuttle as a milestone in transportation systems is presented. ESA space activities are reviewed, including the impact of space programs on European industries and employment. Attention is also given to Japanese and Chinese space programs. The evolution of communications satellites is traced and projections are made for near-term satellite requirements to be incorporated in the construction of Intelsat VI. Finally, advances in production of military jets and helicopters are considered, along with candidate alternate fuel systems to replace petroleum products. M.S.K.

A82-34108 # **Military aircraft and international policy.** B. Revellin-Falcoz (Avions Marcel Dassault-Breguet Aviation, Vaucresson, Hauts-de-Seine, France). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 107-112.

The benefits to an aerospace company manufacturing aircraft which can be adapted to a variety of specific military uses are discussed. The practice is asserted to create production flexibility and increase sales by allowing a basic design to be reconfigured for different buyers and to the same buyer over a number of years. One drawback is that spare parts production must continue over the years for versions which are no longer produced, although some savings are realized in a commonality among different generations of the same aircraft. Sales are noted to be most favorably concluded through the use of a prime contractor who controls all details of a deal, while still answering to the demands and suggestions of all partners and parties involved. Finally, it is mentioned that weapons exports make up for one-quarter of the national cashflow which leaves France for purchases of oil. M.S.K.

A82-34109 # **Commercial transport developments for the 1980's.** J. E. Steiner (Boeing Co., Seattle, WA). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 115-139.

A review is presented of the technology currently incorporated into modern air transportation vehicles and trends for the future are discussed. Reducing fuel consumption has led to the adoption of the high-bypass ratio turbofan, which has also provided significant noise reduction. Wings are being designed with less sweep in order to be more fuel efficient, and combined with new airfoil configurations and fuel-efficient cruise speeds. The commonality of solutions to efficiency problems has led to increasing homogeneity in the design, structure, and components of aircraft built by different manufacturers. Equipment which is not cost-effective tends to be grounded as soon as possible, with new aircraft operating at 40-60% economic improvement over previous generations. A shift to smaller, commuter aircraft is foreseen, along with composite primary structures, full-scale active controls, and a reduction in wing and tail sizes. M.S.K.

A82-34110 # **Military aircraft - The way ahead.** D. Smallwood (British Aerospace Public, Ltd., Co., Weybridge, Surrey, England). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. (A82-34101 16-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 141-147.

Performance and mission requirements for present and future combat aircraft are explored, with a focus on NATO forces in central Europe. Survivability of the aircraft is stressed, particularly in scenarios where airfields have little chance of remaining intact, which is seen as a driving force for near-term operational capability for V/STOL aircraft. Additional necessities for all-weather and climatic conditions operations are listed in addition to nighttime performance ability in all combat modes. Improvements are likely to be forthcoming in the area of composite structures, higher performance engines, and continued automation of avionics and weapons systems, as well higher-resolution radars and task integration in the digitized cockpit avionics displays. M.S.K.

A82-34111 # **The military helicopter market today and tomorrow.** D. O. Smith (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 149-153.

Demands and the status of the present world helicopter market are discussed with an emphasis on military applications. Approximately 29,300 units are expected to be sold in the period 1981-1990, with a total price tag of $29.2 billion, not counting spare parts. Currently, the Sikorsky Black Hawk is being employed by the U.S. Army for carrying combat troops and equipment, while the UH-60A is used as a cargo transport with a capacity of 4 tons. Attack, surveillance, and mine laying are other functions assigned to military helicopters. Development of new helicopters in the U.S. is noted to take seven years, and an estimated 3% of all U.S. helicopters are now over 15 yr. old. M.S.K.

A82-34112 # **Development of an aircraft engine.** J. Calmon (SNECMA, Paris, France). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 155-163.

The evolution of designs in jet engines, requirements which lead to the incorporation of modifications and improvements, and the cooperation between companies to produce the engines are considered in terms of the development of a currently available GE engines. The TF 39 was certified in 1968 for the C5A, experienced a modification in the low-pressure section for use in the DC 10-10, and underwent further changes to be employed in the DC 10-30, A300, and 747, becoming the CF6-50 along the way. The CF6-80 is the next step and will feature a shorter combustion chamber and no turbine midframe. Increasing the fan diameter augments the thrust, and it is noted that 60,000 test hours have accrued on the engine up to 1981. Development, production, and product support for the CFM56 engine is shared 50-50 between GE and SNECMA, and features new materials and electronic fuel control to obtain increased fuel efficiencies. M.S.K.

A82-34113 # **Solutions to the aviation fuel problem.** W. M. Hawkins (Lockheed Aircraft Corp., Burbank, CA). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 165-180.

Projections of the duration of availability of petroleum-derived jet fuels are reviewed and candidates for alternative fuels are discussed. World production of crude oil is expected to begin to irreversibly decline in the 1990s, and the design of new aircraft which could use alternative fuels is noted to depend strongly on the new fuels which have yet to be chosen. Any new fuel supply will be required to have a low producibility cost, be continuously replenishable, be available for multiple uses, be easy to handle and transport, safe to use, cause no major changes in equipment, and be minimally polluting. An additional consideration is that the fuel could be derived where used to avoid the political problems inherent in current fuel supplies. Liquid hydrogen is found to be the best solution because of light weight, water as the source, available everywhere, and costs less than shale or coal-derived fuels. M.S.K.

A82-34114 # Aeronautical research and development. P. Poisson-Quinton (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 181-205. 7 refs.

Aerospace research and development is examined in terms of its role in progress, the necessity for industry, government, and user cooperation, the functions of ONERA, and research results which are beginning to pay off. Research is being channeled by advances in electronics and computer abilities, and balances are needed between basic and applied research funding. Government programs are noted to specifically center around risky and/or long term research, while industry concentrates its efforts on near-term evolutionary studies. ONERA research departments are reviewed, along with outlines of wing fabrication development techniques, the transonic propeller, and a carbon fiber wing. The development of active control systems has resulted in increased fuel efficiencies. The interactions between AGARD, ONERA, NASA, and GARTEUR are outlined. M.S.K.

A82-34120 # Technical trends in the civil aircraft and helicopter industry. R. Chevalier (Société Nationale Industrielle Aérospatiale, Paris, France). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 263-273.

Technical prospects for improvements in aerodynamics, weight savings, propulsion, and navigational systems in the civil air transportation industry in the next two decades are projected. Aerodynamics will encounter more wing-span for efficiency, decreased wing sweep for better low-speed control, and thicker airfoils for improved fuel efficiency. Composites and structures modeled by computer are foreseen as contributing to 15-26 percent in weight savings by the year 2000. The families of future engines include the introduction of high temperature and compression ratio turbofans and turboprops, in addition to propfans, which feature high efficiency at speeds of Mach 0.7 and above. Microminiaturization of electronics is expected to produce another order of weight reduction equal to that already achieved, in addition to improved safety, handling qualities, and control. Greater use of civil helicopters and supersonic transport is predicted. M.S.K.

A82-34121 # Military aircraft. H. F. Rogers (General Dynamics Corp., St. Louis, MO). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 275-290.

Even though the emergence of sustained supersonic cruise and maneuvering as a useful tactical tool is foreseen, no significant expansion of the current operational envelopes of fighters is now in prospect. Maximum speeds at altitude will be in the Mach 2.0-2.2 region, and maximum speeds at sea level will not significantly deviate from the current value of Mach 1.2. Two important uncertainties in the air-to-air arena are (1) positive, all-weather, beyond-visual-range identification and (2) warning and control in a high-density environment. In designing aircraft, the need for realistic requirements, balancing unit (aircraft) effectiveness against total force effectiveness, is stressed. Also considered important is the use of hybrid technology, that is, the careful integration across classic technological disciplines to achieve enhanced operational capability with a more efficient solution. A third requirement is a modular design approach. C.R.

A82-34123 # Business jets to agricultural aircraft - An overview of general aviation. J. H. Winant (National Business Aircraft Association, Washington, DC). In: International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981. New York, American Institute of Aeronautics and Astronautics, 1982, p. 295-300.

Attention is given to the inroads that have been made in the American market by foreign firms. In the turboprop field, which is seen as the area of strongest potential growth in the years immediately ahead, the United States continues to dominate. Attention is also given to the technological importance of business aircraft. The traditional technological spinoff roles appear to be reversing themselves; business aircraft, for so many years inheritors of design concepts born in the military and air transport aircraft industries, are now moving into the position of being the source for significant innovation. Three important technological challenges seen in business aviation are the problem of noise, the need to make aircraft lighter and more slippery, and the development of alternative fuels. C.R.

A82-34125 Fatigue life prediction of helicopter pitch link using Kaman life calculation methods. C. P. Hardersen (Kaman Aerospace Corp., Bloomfield, CT). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 1980, Paper.* 12 p.

This paper uses information supplied by the Army to arrive at a final calculated life for a pitch link component. Discussions are presented on the handling of strength data, load data, and frequency data in the context of a fatigue life computer program. Load and strength are presented as statistics which are randomly combined using Monte Carlo techniques. Improvements in technique could include the consideration of statistical variation on mission, statistical consideration of multi-mode failures, and improved cycle-by-cycle evaluation techniques. (Author)

A82-34127 † Periodic boundary value problem for the equations of the harmonic oscillation of a rotor blade about the axis of a flapping hinge (Periodicheskaia kraevaia zadacha dlia uravnenii garmonicheskikh kolebanii lopasti nesushchego vinta otnositel'no osi gorizontal'nogo sharnira). V. S. Vozhdaev. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 9-18. 5 refs. In Russian.

The numerical calculation of the aerodynamics of a hinged rotor in an oblique flow in terms of blade theory is examined. It is shown that the transformation of the system of coupling equations and equations of the flywheel motion of the blade in blade theory into a system of coupling equations leads to an equation for harmonic oscillations with periodic boundary conditions. A solution to the problem is found in integral form, allowing the solution of the corresponding difference equation expressed in terms of Chebyshev polynomials and related mixed polynomials. The differential equation of flywheel motion is then transformed into the form of an integral Fredholm equation of the second kind. A.L.W.

A82-34128 † Finite element calculation of the aerodynamic forces on a vibrating wing in supersonic flow (Raschet metodom konechnykh elementov aerodinamicheskikh sil na kolebliushchemsia kryle v sverkhzvukovom potoke). V. G. Bun'kov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 19-26. In Russian.

A finite element method is used to calculate the aerodynamic forces on a thin wing with supersonic trailing edges. Velocity potential and deformations are determined for a wing partitioned into both trapezoidal and triangular finite elements by the use of a matrix of aerodynamic influence coefficients expressing the effects of pressure differences on each node. Results of calculations are presented which demonstrate the effects of the Mach and Strouhal numbers on flutter characteristics. A.L.W.

A82-34132 † Similarity parameters for the geometric structure of a supersonic jet propagating in a channel and in a submerged space (Parametry podobiia geometricheskoi struktury sverkhzvukovoi strui, rasprostraniaiushcheisia v kanale i zatoplennom prostranstve). E. A. Leites. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 54-63. 14 refs. In Russian.

An approximate method is used to determine the linear length scales of a jet propagating in a cylindrical channel or a submerged space. The method is based on a linearization of the differential equations of motion for an inviscid compressible, nonheat-conducting perfect fluid a sufficient distance from the nozzle exit to obtain a relation between the longitudinal and transverse length scales. The analytical relations obtained are shown to be in agreement with experimental data and the results of numerical studies for a wide range of flow parameters for axisymmetric and plane jets. A.L.W.

A82-34135 † Temperature fields in three-layer panels with a honeycomb filler during unsteady heating (Temperaturnye polia v trekhsloinykh paneliakh s sotovym zapolnitelem pri nestatsionarnom nagreve). S. N. Ivanov and M. A. Morozov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 97-104. 5 refs. In Russian.

The unsteady temperature fields in a three-layer panel with a honeycomb filler are calculated by an approximate method. Equations for heat balance in elements of the filler and sheathings with temperature-dependent thermophysical properties were solved under conditions of unsteady nonuniform heating, with the effective thermal conductivity of the filler in a direction parallel to the sheathing determined taking into account both conductive and radiative heat transfer along the honeycombs. Calculated temperature distributions are compared with those measured for the upper and lower sheathings of a three-layer panel with and without edge ribs heated along a narrow band of the center section to temperatures of up to 800 C to demonstrate the validity of the approach. A.L.W.

A82-34136 † Detached flow past V-shaped low-aspect-ratio wings (Otryvnoe obtekanie V-obraznykh kryl'ev malogo udlineniia). S. K. Betiaev, M. I. Grigor'ev, and G. G. Sudakov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 105-109. 8 refs. In Russian.

The aerodynamic characteristics of a V-shaped wing are investigated theoretically and experimentally as a function of wing dihedral angle. Experiments were performed with a wing model with a sweep of 80 deg and dihedral angles from 0 to 40 deg attached to a conical body at angles of attack from -5 to 16 deg and free-stream Mach numbers of 0.6 and 1.1. Theoretical calculations were carried

(1) thrust optimization, (2) optimization of in-flight aerodynamic configuration, and (3) flight plan optimization. The use of flight management computers to achieve these goals is discussed and recently developed equipment is depicted. System design and functions are explained. The choice of performance optimization criteria (cost index) is considered. How a flight management computer deals with horizontal navigation is treated as an example. Author (ESA)

PRODUCTION OF RELIABLE FLIGHT CRUCIAL SOFTWARE: VALIDATION METHODS RESEARCH FOR FAULT TOLERANT AVIONICS AND CONTROL SYSTEMS SUB-WORKING GROUP MEETING
J. R. Dunham, ed. and J. C. Knight, ed. (Virginia Univ.) May 1982 27 p refs Meeting held at Research Triangle Park, N.C., 2-4 Nov. 1981
(NASA-CP-2222; L-15291; NAS 1.55:2222) Avail: NTIS HC A03/MF A01 CSCL 09B

The state of the art in the production of crucial software for flight control applications was addressed. The association between reliability metrics and software is considered. Thirteen software development projects are discussed. A short term need for research in the areas of tool development and software fault tolerance was indicated. For the long term, research in format verification or proof methods was recommended. Formal specification and software reliability modeling, were recommended as topics for both short and long term research. N.W.

COMBINING ANALYSIS WITH OPTIMIZATION AT LANGLEY RESEARCH CENTER. AN EVOLUTIONARY PROCESS
James L. Rogers, Jr. Apr. 1982 11 p refs Proposed for presentation at the 2nd Intern. Computer Eng. Conf. and Show, San Diego, Calif., 15-19 Aug. 1982
(NASA-TM-84472; NAS 1.15:84472) Avail: NTIS HC A02/MF A01 CSCL 09B

The evolutionary process of combining analysis and optimization codes was traced with a view toward providing insight into the long term goal of developing the methodology for an integrated, multidisciplinary software system for the concurrent analysis and optimization of aerospace structures. It was traced along the lines of strength sizing, concurrent strength and flutter sizing, and general optimization to define a near-term goal for combining analysis and optimization codes. Development of a modular software system combining general-purpose, state-of-the-art, production-level analysis computer programs for structures, aerodynamics, and aeroelasticity with a state-of-the-art optimization program is required. Incorporation of a modular and flexible structural optimization software system into a state-of-the-art finite element analysis computer program will facilitate this effort. This effort results in the software system used that is controlled with a special-purpose language, communicates with a data management system, and is easily modified for adding new programs and capabilities. A 337 degree-of-freedom finite element model is used in verifying the accuracy of this system. M.D.K.

AEROACOUSTIC PERFORMANCE OF AN EXTERNALLY BLOWN FLAP CONFIGURATION WITH SEVERAL FLAP NOISE SUPPRESSION DEVICES
Daniel J. McKinzie, Jr. May 1982 30 p refs
(NASA-TP-1995; E-573; NAS 1.60:1995) Avail: NTIS HC A03/MF A01 CSCL 20A

Small scale model acoustic experiments were conducted to measure the noise produced in the flyover and sideline planes by an engine under the wing externally blown flap configuration in its approach attitude. Broadband low frequency noise reductions as large as 9 dB were produced by reducing the separation distance between the nozzle exhaust plane and the flaps. Experiments were also conducted to determine the noise suppression effectiveness in comparison with a reference configuration of three passive types of devices that were located on the jet impingement surfaces of the reference configuration. These devices produced noise reductions that varied up to 10 dB at reduced separation distances. In addition, a qualitative estimate of the noise suppression characteristics of the separate devices was made. Finally static aerodynamic performance data were obtained to evaluate the penalties incurred by these suppression devices. The test results suggest that further parametric studies are required in order to understand more fully the noise mechanisms that are affected by the suppression devices used. M.G.

GENERATION OF NOISE BY TURBULENCE
Robert Legendre 1981 35 p refs In FRENCH; ENGLISH summary Report will also be announced as translation (ESA-TT-763)
(ONERA-P-1981-3; ISSN-0078-379X) Avail: NTIS HC A03/MF A01

The notion of noise source is elaborated, distinguishing between turbulent agitation, which is a cause, and acoustic agitation which is a minor effect or subproduct whose essential particularity is its propagation at the speed of sound. This allows for a precise definition of noise, derived from acoustic potential and apart from pseudo-noise linked to turbulence. The equation, valid for this potential, is established by an almost complete elimination of state variables and is linearized. This enables a study of convection and refraction effects and shows that generated noise is in proportion to the density relative variation rate. A model of anisotropic turbulence inside a shear flow is proposed. Its use shows that the noise generated inside a vortex tube is proportional to the square of the circulation. Application of the findings to interpretation of noise measurements in wind tunnels, e.g. aircraft noise predictions, is discussed. An extension of the method in order to include noise near obstacles is outlined. Author (ESA)

TESTING OF THE KUIPER AIRBORNE OBSERVATORY 91-CM TELESCOPE Final Report
Robert E. Parks Jul. 1979 49 p refs
(Contract NAS2-10085)
(NASA-CR-166341; NAS 1.26:166341) Avail: NTIS HC A03/MF A01 CSCL 03A

The 91 cm telescope of the Kuiper Airborne Observatory was tested for optical figure errors in the surface of the mirrors and misalignment of the optical components. When the present set of optical components are installed in the telescope in proper alignment, the telescope produces an image with 80% of the energy in a circle of 1.50 arc seconds in diameter; that is, a 0.11 mm spot diameter in the focal plane. The primary mirror, an f/2 parabola, was tested against a flat and has a quality that puts 80% of the energy in a 0.51 arc second diameter spot. Two principal sources account for the residual error: the tertiary folding flat and the chopping secondary. It appears that the method of mounting the folding flat causes some distortion and that the secondary mirror has some residual spherical aberration in its figure. S.L.

STUDY OF VTOL IN GROUND-EFFECT FLOW FIELD INCLUDING TEMPERATURE EFFECT Final Report
W. G. Hill, R. C. Jenkins, S. G. Kalemaris, and M. J. Siclari Apr. 1982 179 p refs
(Contract NAS2-10645)
(NASA-CR-166258; NAS 1.26:166258) Avail: NTIS HC A09/MF A01 CSCL 01A

Detailed pressure, temperature, and velocity data were obtained for twin-fan configurations in-ground-effect and flow models to aid in predicting pressures and upwash forces on aircraft surfaces were developed. For the basic experiments, 49.5 mm-diameter jets were used, oriented normal to a simulated round plane, with pressurized, heated air providing a jet. The experimental data consisted of: (1) the effect of jet height and temperature on the ground, model, and upwash pressures, and temperatures, (2) the effect of simulated aircraft surfaces on the isolated flow field, (3) the jet-induced forces on a three-dimensional body with various strakes, (4) the effects of non-uniform coannular jets. For the uniform circular jets, temperature was varied from room temperature (24 C) to 232 C. Jet total pressure was varied between 9,300 Pascals and 31,500 Pascals. For the coannular jets, intended to represent turbofan engines, fan temperature was maintained at room temperature while core temperature was varied from room temperature to 437 C. Results are presented. B.W.

SOLID-STATE FLIGHT INCIDENT RECORDER
D. Amundson *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 17-31 refs

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

A deployable flight incident recorder based on MNOS technology, suitable for fighter aircraft, is described. Capable of recording 30 min of digital and 15 min of audio information, the equipment weighs 3.5 lbs and dissipates 3.5 W. Flight and crash tests show that it is more reliable than tape recorders, and improves access times a million-fold. If audio is not required, engine monitoring, aircraft fatigue recording and program storage for onboard computers are possible. Author (ESA)

SOLID STATE CRASH SURVIVABLE FLIGHT DATA RECORDERS FOR MISHAP INVESTIGATION
H. R. Ask *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 33-68 refs

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

The state of the art in solid state memories, microprocessors and crash survival is reviewed. Flight recorders for small and large civil transport aircraft are described. Heat flow problems with crash survivable designs are solved, using an intumescent outer layer for the enclosure. This provides heat absorbtion during a phase change, followed by creation of a passive insulation layer formed by the charred residue. An aluminum alloy housing under the intumescent layer is the primary rigid structure for penetration, shock and static crush resistance. The small aircraft system has a 131 kbit memory, providing 30 min of prior flight data with > 100% reserve, using data compression. It protects airborne and on ground signal goodness data and is nondeployable. The large aircraft system stores the 21 min of raw input data and the last 15 hr of data in memory with data compression possible. It protects in memory two flight cycles of any duration, with total elapsed time > 25 hr possible. Author (ESA)

A PILOT'S VIEW ON POSSIBLE USES OF AIDS
Christian Denke *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 125-130

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

Problems with the U.S. beacon collision avoidance system and the Eurocontrol - DFVLR airborne link terminal are highlighted. The U.S. system cannot handle a large number of aircraft, and resolves encounters through distance and flight level, with no reference to relative position. Avoidance maneuvers are only possible in the vertical plane. The avoidance maneuver logic has not been proven capable of accounting for individual aircraft performance. The European system substitutes visual messages for voice communication, increasing the already considerable visual workload. Its insistence on rigidly adhering to flight plans (as an aid to strategic ATC) increases fuel costs. Author (ESA)

A NEW ALL-PURPOSE DIGITAL FLIGHT DATA RECORDER
P. H. Esson *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 131-158 ref

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

A recorder which can be installed interchangeably in ARINC 542 or ARINC 573/717 equipped aircraft features a coplanar, peripheral belt driven magnetic tape transport containing 450 ft of 1/4 in tape. Two interleaved 4-channel read/write heads and two erase heads are incorporated. A 7.5 deg external drive step motor operating in a slew mode drives the tape at 6 ips. The electronics cards are standard plug in boards containing: read/write, transport, data acquisition data acquisition expansion, and aircraft wiring interfaces; as well as the recording system and data acquisition controllers. The built in test capability exceeds 95% fault detection. Author (ESA)

AERONAUTICAL INFORMATION DATA SUBSYSTEMS

Frank W. Fischer *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 159-184 refs

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

The case for reorganizing aeronautical information processing is argued. Air traffic controllers need access to correct, current, definitive data on activity in their area. Since they have to make real time decisions, systems must provide information in a rapidly assimilable and retransmissible form. A centralized data source is required to preprocess data. LA RECHERCHE AEROSPATIALE, BI-MONTHLY BULLETIN, NUMBER 1981-6, NOVEMBER-DECEMBER 1981

Claude Sevestre, ed. Paris ESA Mar. 1982 72 p refs Transl. by ONERA into ENGLISH from 'La Rech. Aerospatiale, Bull. Bimestriel (Paris) No. 1981-6, Nov.-Dec. 1981' Sponsored by ESA

(ESA-TT-741) Avail: NTIS HC A04/MF A01; original report in FRENCH available at ONERA, Paris FF 55

The interaction of an oblique jet with a subsonic flow was studied. Aerodynamic flow measurement, using fluorescence and laser Doppler velocimetry are discussed. Fatigue crack propagation, and subsonic flutter of compressor blades were examined. Approximate compressibility relations and Euler equations of motion are treated. An implicit pseudo unsteady calculation method for transonic flow is presented.
